A. S. Burleson, Postmaster-General

RESISTAL EYETECTS

Officially Approved and Recommended by Military Authorities

The U. S. Bureau of Standards reported after two exhaustive tests of RESISTAL glass in March and May, 1918: "The relatively increased non-shatterability of laminated (RESISTAL) glass and its comparatively good transparency and rigidity even after puncture, give it great importance in devices for protecting the eyes and face." "In view of the tenacity with which celluloid holds glass and prevents it from shattering, the slightly lower light transmission of such a combination is probably compensated by the superior protection offered to the eyes in case of accident to the goggles."

Write us for these Reports in Full

GUARANTEE

This Guarantee of
RESISTAL AVIATOR GOGGLES
is to Certify that

1. **Resistal lenses are the same** as those tested by the **U. S. Bureau of Standards Test No. 13004**, and made the subject of **Bureau of Standards Report of March 25, 1918.**
2. They are unshatterable and will undergo with the same results the tests made by the Bureau of Standards.
3. They will not destroy, reduce, distort or impair the vision in any way, no matter when, where or for what length of time they may be continually worn. Specifically, this guarantees that the wearer of Resistal Goggles will pass the standard vision tests of the U. S. Aviator (Army or Navy) as well with Resistal Goggles as he may have without any goggles before his eyes.

STRAUSS & BUEGELEISEN

The U. S. Navy specifies Unshatterable Aviator Goggles and RESISTAL EYETECTS are supplied to Navy Aviators by the Navy Department

"I am sending to you a glass from one of your pair of Resistal Goggles. On March 22, 1918, I fell in a plane, striking my head on the cowl of my ship. These glasses saved my eye from probably a bad wound. I am writing to show my appreciation of your non-breakable glasses."—(Signed by a Flying Cadet at Houston, Texas—name on request.)

Send for Booklet on RESISTAL EYETECTS telling of many aviators' experiences

KING OF ENGLAND ASKS FOR MORE U. S. AEROPLANES

REPRESENTATIVE PADGETT. of Tennessee, chairman, and seven other members of the House Naval Affairs Committee, have returned from Europe enthusiastic over the work of the American Navy in the war zone. With Mr. Padgett were Representatives Hensley, Missouri; Farr, Pennsylvania; Venable, Mississippi; Browning, New Jersey; Connelly, Kansas; Riordan, New York, and Peters, Maine.

Representatives Hicks, of New York; Wilson, Texas, and Oliver, Alabama, who went over with the party, remained abroad for further observations. Representative Butler, of Pennsylavnia, another member, had returned previously.

"We examined into all the naval activities, including air stations," said Mr. Padgett. "The committee is much pleased with its inquiry. We found the naval situation excellent. We found splendid team work between the naval services of the United States and the Allied navies. We found the best of coordination between the American navy and the American army forces."

Representative Sherley, of Kentucky, chairman of the House Appropriations Committee, also returned from a trip to England and France. While away he inquired into the organization and handling of the American forces and materials overseas and conferred with officials of the Allied governments. He will give President Wilson the benefit of his observations within a day or two.

Representative Farr, of Pennsylvania, said **the King of England told members of the committee that he wished more aircraft would come over from America.** Premier Lloyd George said the American troops arrived in force just in time, while Premier Clemenceau of France, Mr. Farr said, declared that the American forces "not only brought punch but good luck."

"Our boys are doing wonderfully good fighting," continued Mr. Farr. "It was the recklessness of their dash that, at critical moments, overwhelmed the enemy. Aside from that they achieved themselves. They have put new courage and inspiration into the French and British.

"The destroyers we have over there are doing great work, but we need more of them.

"We need more aircraft, and then more. That is the cry that goes up from the Allied forces—send more aircraft."

SECRETARY BAKER AND JOHN D. RYAN IN FRANCE TO LOOK OVER AIRCRAFT SITUATION

SECRETARY OF WAR BAKER has arrived in France on a second mission in connection with the affairs of the American Expeditionary Force.

Formal announcement of the safe arrival of the Secretary and members of his party, who went abroad on a troop ship loaded with soldiers, was withheld until late September 8, following the receipt of official notice from France. It is now permissible to say that the Secretary sailed on Saturday August 31, and he crossed in approximately a week. It is apparent, therefore, that he went on one of the fastest transports.

Secretary Baker is accompanied by Second Assistant Secretary of War John D. Ryan, who is now in charge of all the army aircraft activities; also by Surgeon General Gorgas and Brig. Gen. Frank T. Hines, Chief of the Army Embarkation Service. Before leaving Washington he declined to indicate the purpose of his sudden trip, but said that this would become known after his arrival, when it could be assumed from the personnel of his party. There can be no doubt, therefore, that the primary matters in which Secretary Baker will interest himself while in France relate to aeronautics. medical and embarkation services.

The only official statement authorized regarding the mission of Mr. Baker was issued by the War Department on September 8 as follows:

"The Secretary of War has arrived in France on official business. News of the safe arrival of Mr. Baker and an official party was received at the War Department today. The voyage was made aboard a transport which carried the usual quota of United States troops. The Secretary was accompanied by John D. Ryan, Second Assistant Secretary of War; Major Gen. W. C. Gorgas, Surgeon General of the Army; Brig. Gen. Frank T. Hines, Chief of the Embarkation Service; and Lieut. Col. George H. Baird, Military Aide to the Secretary of War."

It is believed that the report filed by the sub-committee of the Senate Military Committee, which investigated allegations of failure in the American aviation program, served as the mainspring for Secretary Baker's sudden trip. This report was made public on August 22. Eleven days later Secretary Baker started for France accompanied by the man to whom the Administration is now looking, more than to any other person, for results in army aviation. On Saturday, August 25, the Senate Committee made public the testimony on which the Thomas report was based.

On Wednesday, August 28, Secretary Baker announced the selection of John D. Ryan to act as Second Assistant Secretary of War with full responsibility over the army's air service. At the time this announcement was made Secretary Baker and Mr. Ryan were packing their grips for the trip to France.

While they are in France it is expected that Secretary Baker and Mr. Ryan will go into a most careful inquiry into army aircraft matters, and that an effort will be made to reach a clearer view of the needs of the situation as viewed by General Pershing and American aviation experts and flyers abroad.

PATHFINDING AERIAL MAIL FLIGHT SUCCESSFUL, TO BE FOLLOWED BY PERMANENT LINE TO CLEVELAND AND CHICAGO

THE pathfinding aerial mail flight to Cleveland and Chicago, which was made without planning or spare machines has shown the thorough practicability of establishing a permanent aerial mail line between New York and Cleveland and Chicago, and such a service is to be established within a month.

The first trial has shown that with a few spare machines, or by employing twin-motored machines, mail can be sent from New York to Chicago and vice-versa in less than ten hours. Gardner actually made the Chicago-New York flight in 14 hours, including the stops at Bryan, Cleveland and Lock Haven!

The importance of the achievement is ably summarized in the following telegram sent to Chicago by the Aero Club of America authorities, to be read at the banquet given by the Chicago Merchant Association:

"Kindly convey the following message through Mr. Chas. Dickinson, the President of the Aero Club of Illinois, and through the President of the Merchants Association of Chicago and Postmaster Carlisle.

"The Aero Club of America wishes to express its hearty congratulations to Capt. B. B. Lipsner, Superintendent of the Aerial Mail, and to aviators Miller and Gardner upon the completion of the first pathfinding New York-Cleveland and Chicago Aerial Mail Flight.

"It was a splendid achievement in every way and has opened the way for the permanent Aerial Mail Line between New York, Cleveland and Chicago. We know that this achievement was accomplished with only few days of organization and that the weather conditions were most unfavorable. The Post Office deserves additional credit for having carried out this project under such adverse conditions.

"The people of Chicago and Cleveland are also to be congratulated for the promptness and their progressiveness in cooperating so fully in carrying out this flight, which is the forerunner of the permanent Aerial Mail Service between these cities. The aeroplane has cut down the distance between New York and Chicago to seven hundred miles and will cut down the time required to deliver mail and express to less than ten hours.

"Please also extend the Aero Club of America's hearty congratulations to General Kenly, the progressive and energetic Director of Military Aeronautics, and his aviators who have just successfully completed the three thousand mile flight, creating enthusiastic interest in aeronautics and in the war throughout the country.

"The Aero Club of America is proud of having had the privilege to cooperate in carrying out the Aerial Mail project, both because it is an epoch-making event and because of the progressive and cordial people connected with this undertaking.

"(Signed) ALAN R. HAWLEY, President,
"Aero Club of America."

The telegram from Chicago also praises the newly made maps of the Woodrow Wilson Airway, which was used by the aviators in flying from New York to Chicago.

Duplicate copies of the map were carried by the aviators, which will be returned to the Aero Club, signed by the aviators and postal authorities, and one copy will then be sent to President Wilson, one copy to Postmaster General Burleson, one copy to Postmaster Praeger, for the Government archives.

The map was made especially for use of aviators and only gives the features essential to aviators, on a scale suitable for the aviator who flies at 80 to 100 miles an hour, who would be confused by the average map.

The maps, which have been made under the direction of Messrs. Henry Woodhouse and Captain Robert A. Bartlett, the famous explorer, comprise seventeen sections, extending from New York to San Francisco. They have cost $6,000 to make, exclusive of the cost of printing.

The Woodrow Wilson Airway was named after President Wilson last year by the Aero Club of America, when the President signed the $640,000,000 appropriation for army aeronautics.

The Aero Club of America adopted a resolution to establish the Woodrow Wilson Airway and communicated the resolution to Congressman Murray Hulbert, who was prominent in conducting the campaign for the building of our aerial defenses, submitting the matter to President Wilson. The President's answer was as follows:

"My dear Mr. Hulbert:

'Thank you warmly for having let me see the enclosed telegram. It heartens me mightily. It is very delightful to have such a feeling exist and to receive such evidence of support and approval.

"Cordially and sincerely yours,
"WOODROW WILSON."

The Woodrow Wilson Airway represents a belt eighty miles in width, extending from New York to San Francisco. A line through the center of this belt touches the most important cities, through the States of New York, New Jersey, Pennsylvania, Ohio, Michigan, Indiana, Illinois, Iowa, Nebraska, Wyoming, Colorado, Utah, Nevada and California.

The Airway belt extends forty miles on each side of the line, so the air traveller can reach the extreme part of either side of the belt in half hour of flying. Any city or community located within this eighty mile belt will be designated as being on the Woodrow Wilson Airway. Landing places for aircraft and identification marks will be placed first in the important places in direct line of the Airway, then at the approach of every community.

The maps are made especially for the use of aviators and show land marks, elevations, and other important things which an aviator must know when he flies. Each section of the map has a corresponding chart giving the silhouette of the elevations of the land over the entire route.

The map also gives the compass directions, magnetic declination, the distance between cities, and other information of value to aviators.

Statement of Max Miller, Aerial Mail Pilot No. 1

I LEFT Belmont Field, Long Island, at 7:08 A.M., Thursday, September 5, with a good wind in back of me, flew over the City of New York, the Hudson River and Hoboken, and headed west 284 degrees.

There was a bank of low clouds near the ground and another layer of clouds at a high altitude. I kept right between them and flew on my compass course. I could not see the ground, but ran for about two hours and at ten o'clock I came down through the lower strata of clouds and landed one mile from Danville, N. Y., about 155 miles from New York City. There I inquired to find out my bearings and found that I was not more than two miles out of my course. I did not kill the motor, but left it running, and after five minutes started up again and headed for Lock Haven. I entered the fog which hung low over the ground and over the tops of the mountains, and I figured that it would take me about three quarters of an hour to make Lock Haven. I came down and saw the field through a notch in the mountains and made a good landing. My motor was missing, so I changed spark plugs which took me about an hour, filled up with oil and gas, got a couple of sandwiches, and left about 11:45 A.M.

I climbed up through the fog again and went on over the mountains. I sailed on my compass course for an hour, 283 degrees, and I figured I was about 100 miles further on. Then I came down to see where I was and get my bearings, and the first thing I knew I hit the top of a tree. That sure gave me a good scare. I hustled back up again into the fog, determined to get plenty of altitude and keep on going as long as my gas held out. I went fifty miles, and then I found my radiator was leaking and I came down and I saw a town with a fair going on. There was such a mob of people that I did not land there, but went on about twenty miles to a town named Cambridge. I inquired where I was and was told "Jefferson." On looking on my map I found a town called Jefferson lying to the north of my route, so on leaving I headed toward the south again in order to cross the route again; but I found that it was Jefferson County, Pa., instead of the town of Jefferson, Ohio, and I went about 150 miles out of my way before reaching Cleveland, where I had to remain all night on account of darkness. The next morning I got my radiator fixed and rested up after being buffeted about by the storm and rain, and got away at 1:35 P.M. for Bryan on the compass course of 275 degrees, a little south of due west about 140 miles. I had to stop several times to fill up my radiator with water. The weather was very much better, and I was able to make Bryan, where I was received by Postmaster Jordan and got away at 4:35 P.M. I skirted the southern shore of Lake Michigan, and arrived over Grant Park at an

(*Continued on page* 1313)

THE NEWS OF THE WEEK

American, French and Italian Aviators Help Lafayette Day Celebration

In spite of the severe weather conditions on Lafayette Day, the American, French and Italian aviators helped greatly to celebrate Lafayette Day in New York.

Thirty-six Allied aviators participated in the celebration, including Major Yeast, who lead the squadron formation; Major Baroetta, in charge of the French Aviation Commission; Captain Boyrivien, the noted French veteran aviator; Captain Bachellier, veteran French observer, attached to Mineola Headquarters for instruction of observers; Lieut. Parvis, the Italian Ace who has nine Austrians to his credit.

The squadron formation was led over New York from Mineola by Major Yeast, and gave some very remarkable demonstrations. The aviators dropped thousands of special cards bearing the pictures of General Foch and General Pershing and the American and French flags on the other side, with suitable expressions.

Lieut. Flashaire flew under all the New York bridges, repeating the recent performance of Captain Boyrivien.

Lieut. Parvis flew the American Caproni biplane equipped with three Liberty motors, which is now being tested and from which remarkable results are expected.

The New York public was greatly interested in the aerial demonstrations and once more is indebted to the Mineola aviators for a very interesting and educational entertainment.

Sixty Army Aeroplanes in 2-Hour Manoeuvre

Mineola, L. I., Sept. 9.—Sixty army aeroplanes of five different types, piloted by American airmen of the First Provisional Wing unit at Mitchel Field, today stayed in the air for two hours without a mishap while a series of moving pictures was taken to show the public the work of training a military flier. Thirty-six planes manoeuvered for several minutes in a huge battle formation with such skill that Major W. J. East, in command of the field, received congratulations from allied aviators who saw the exhibition.

Films of every stage of the work of making a military aviator were taken for the Department of Military Aeronautics, and will be sent to Washington to be distributed throughout the country. Some of the pictures were taken from the ground and others from aeroplanes flying at great heights singly and in battle formations. The photography was done by enlisted men in the Signal Corps who have taken courses in military photography at Columbia University.

Officers at the field said they did not think a larger number of military aeroplanes had ever taken to the air at the same time above a single field in this country. When plans were made for the flights there was some apprehension about safety, but the pilots handled their machines so skillfully that no machine was forced to the ground.

Among the planes in flight were the De Haviland 4, equipped with Liberty motors; the American-built Caproni, also with Liberty motors; the Curtis J. N. D. 4; the Curtis type H, with Hispano-Suiza motor, and the Thomas-Morse monoplane scouts.

In the battle formation of thirty-six machines were several of the De Haviland machines of the type used by the American squadron on its first flight over the German lines in command of Brig. Gen. Benjamin D. Foulois. General Foulois had eighteen machines in his reconnoissance squadron. The large formation yesterday was in command of Lieutenant George Zeisner, flying at the peak. He commanded units of the machines in practice formations over New York City for several days.

The thunder of the sixty motors and the sight of the large number of machines in the air attracted thousands of spectators, and the roads were crowded with automobiles. All the other cadet fliers not in the First Provisional Wing and all the mechanics and officers at the field watched the manoeuvers with glasses.

After the films are developed they will be shown at the fields here to point out defects in flying to the men, and then will be taken to all the other grounds and flying schools in the country.

Aviators Dinner Guests of Manufacturers

Chicago, Ill.—As a part of the program of the Illinois Manufacturers' Association to stimulate interest here in the manufacture of aeroplanes and the obtaining of government contracts, a dinner was given in the gold room of the Congress Hotel in honor of visiting aviators. There were present about thirty officers of the air squadron which is taking a prominent part in the government war exposition.

Lieut. Thos. Hitchcock, Jr.

Among the speakers were General Charles F. Lee, head of the British aviation mission to the United States; Major General W. L. Kenly, director of military aeronautics of the United States Army; William B. Wilson, Secretary of Labor; Lieutenant Colonel C. K. Rhinehardt, commander of the flying circus, and Colonel George T. Buckingham.

Lieutenant Thomas Hitchcock, Jr., Who Has Escaped from Germany

Lieutenant Thomas Hitchcock, Jr., whose photograph is given above, has escaped from a German prison camp and has made his way over the border into Switzerland. He was captured on March 6th after an encounter with several German planes. He was wounded in the side and his machine fell behind the German lines. He was taken to Saarbrucken and later transferred to a camp in Bavaria. He escaped from there and walked about eighty miles to the Swiss frontier.

Before the United States entered the war he was known as a horseman and polo player. He tried to enlist in the American Aviation Corps, but was turned down on account of his youth. He went to France in June, 1917, and after training there he was assigned to the famous Lafayette Escadrille. He did not retransfer to the American forces. Last July he was made a lieutenant, though he was a prisoner at the time, in recognition of his work. He has the Croix de Guerre.

He is a son of Major Hitchcock of the Mineola Training Division. According to dispatches received he will not be interned in Switzerland and will come to the United States immediately.

Warns of Soldiers' Mail

Postmaster Patten issued a statement in which he called the attention to the ruling that soldiers' mail, both letters and parcels, must be specifically addressed.

The address on a soldier's letter must give the company, regiment and division to which he is attached.

Lieut. G. S. Touchard Dies

Toronto, Ont.—Lieutenant G. S. Touchard, former tennis champion and instructor in the Royal Air Force, died here suddenly at the General Hospital from an abscess of the brain. He entered the hospital to undergo an operation on his throat. His home was in New York City. He was a widower.

U. S. Fliers to Aid Canada

Ottawa, Ontario.—C. C. Balantyne, Dominion Minister of Naval Service, announced here the establishment of the Canadian Royal Naval Air Service, and declared that, thanks to America's aid, "machines are flyinig along the Atlantic Coast, ready to bomb hostile submarines, escort convoys and perform other services."

The United States, he said, had "consented to supply the personnel for Canada's Royal Naval Air Service until such time as a Canadian personnel could be properly trained to take their places."

Also, he said, the United States had supplied the necessary machines, which include aeroplanes, airships and kite balloons.

Our Own Planes Guard Our Men

Washington.—Confidential messages from General Pershing and other reports from France indicate that the American army now is supplied with sufficient aeroplanes of all kinds to protect its men in battle.

General March, chief of staff, gave this information to members of the House Military Committee at their weekly conference at the War Department.

Postmaster Patten of New York handing a bag of mail to Aviator Max Miller at the start of the New York-Cleveland Pathfinding Flight

Air Fighters to Use Cameras to Shoot

Dallas, Tex.—The eye of the camera instead of rapid firing guns is being used to record direct hits on "enemy" planes by aviation cadets in Texas training camps.

After the great thrill of the first solo flight, the nose dive, the tail spin and the loop, blouses are discarded and a course of study in geometry, mathematics and physics is entered into by the cadets that far surpasses that of many a scientific school.

Days of drill and study, hot mornings at the rifle range, and then comes the first b.g lesson in aerial gunnery. But the cadet goes into the air armed with nothing more deadly than the camera to put into practice the knowledge he has acquired.

An aeroplane soars near by in the guise of an enemy ship and is snapped by the cadet, whose degree of accuracy is indicated by the nearness of the picture to the centre of the lens, which is marked in circles.

The school of aerial gunnery at Love Field is turning out fliers having a degree of accuracy that will give them great confidence once they reach the battlefields of France, officers declare. This accuracy comes only after the hardest study and practice.

For the actual ground practice a hill has been built back of the target range. Thousands of pounds of bullets already have been poured into it from students' guns.

A tiny wooden reproduction of an enemy plane is the object of this practice. The target is an unindicated spot on a nearby white sheet before which the plane, flying at a given speed, would be passing when the American plane's shots reached it. The student figures out the speed and the angle of ascension and distance of the enemy, adjusts his gun and aims at the tiny plane. Then if he is accurate in his shooting and his calculations the bullet should pierce the spot marked on the back side of the white sheet.

Students also are carefully drilled in the strategy of manœuvring into the one spot in the rear of the enemy plane whence he cannot shoot. From this position they can pour their own shots into the enemy.

American Flyer Outwits 14 Hostile Airplanes

With the American Army in France.—An American observation plane while on a photographic flight was attacked on Sept. 7th by fourteen German planes. By skilful manœuvring the pilot brought the machine safely back into the American line.

British Seek Mechanics

A recruiting drive for mechanics in the British Royal Air Force, which was stopped recently because the number of men then desired had been obtained, will be resumed at once, according to a statement on Sept. 5 by Colonel Lord George Wellesley at the British-Canadian Recruiting Mission, 220 West Forty-second Street.

The applicants must be British subjects who have registered at their respective local draft boards. Compensation will be $1.10 a day while in Canada, and if the men are required to serve overseas the British rate of pay will apply from the date of embarkation.

It was explained that the mechanics now sought are as follows: Blacksmiths, metal turners and machinists, carpenters and cabinet makers, coppersmiths, upholsterers, chauffeurs, engine fitters, photographers, wireless operators and watchmakers. Applications may be made at any British or Canadian recruiting mission.

Applicants for cadet vacancies are asked either to write or call in person on the first floor of the West Forty-second street mission.

Norman van Hyning, instructor in lighter than air (Balloon and Dirigible) at the Naval Aviation school at Akron, Ohio

Many Aeroplanes Ready

Washington.—General March, the Chief of Staff, told members of the Senate Military Committee on Aug. 31 that reports received to date show that more than a thousand De Haviland aeroplanes have been completed or are in readiness to be turned over to the Government. He explained that of this number a large part had been shipped overseas to France for use by the Expeditionary Forces or have been sent to port for shipment overseas.

U. S. Pilots in Record Flight

A description of what is believed to be the longest flight made thus far by an entire squadron of battleplanes driven by American pilots abroad is contained in a letter just received here by Lieut. Leopoldo Belloni from Gianni Caproni, designer of the giant aeroplane bearing his name. The squadron of eight machines left the Caproni factories near Milan at 6 A. M. Shortly before noon they were all circling over Rome, having covered 450 miles in a little less than six hours.

The planes were all of the Caproni Ca 5 type, a reproduction of which fitted with twelve-cylinder Liberty engines is now being turned out in this country. Each machine carried a crew of five men. The commanding officers were Capt. La Guardia and First Lieuts. Mendel Hauch, William Agar and Mowat Mitchell.

The flight was made at an altitude of from 2,000 to 9,000 feet and the inhabitants of Bologna, Florence and Pisa caught their first glimpse of an American air squadron, which they cheered vociferously. Signor Caproni says the American pilots showed great skill in flying over such natural obstacles as the Apennine Mountains. The Italian press printed enthusiastic comments on the flight.

Say Allies Beat Germans

An Atlantic Port.—Several American and British officers belonging to the air forces in their respective armies arrived on Sept. 2 from the western front to give instruction to the cadets at the aviation camps in the United States. They declined to comment on the war except to say that the Allies were decidedly ahead of the Germans in aviation and artillery, and each infantryman had proved to be worth at least two of the enemy, including the much-advertised Prussian Guard.

Captain Lewis D. Boeree of Winnipeg, Man., who was on his way home suffering from shock through overflying, has officially brought down twelve Hun machines and has spent the last three months with the American soldiers on the western front. He said that he liked them immensely in every way, and it was a certainty that the American Army will continue to make its mark throughout the war.

Bolling Field to Be Improved

The Assistant Secretary of War has approved an allotment of $103,850 for improving and extending Bolling Field, Anacosta, D. C. This field is being enlarged for the aerial patrol and protection of Washington, as well as to meet the training needs of the Air Service officers in Washington. An additional hangar will be erected and quarters for twenty-three officers and 154 enlisted men provided. The high tension electrical wires at the southern end of the field and the drainage ditch, which are now dangerous to the flyers, will be removed. An aero repair shop and a machine shop will be erected and the whole field encircled by a high barbed wire fence. There will be a balloon station with one company located north of the flying field. The equipment will include captive balloons and free balloons for training observers. A photo developing hut for the developing and printing of aerial photographs taken in the vicinity, and a small radio telegraph station for the purpose of working up communication with aeroplanes while in flight will be additional features of the development of this aero flying field adjacent to the National Capital.

Painted Picture from Aeroplane

Sgt. First Class, Lawson Adams, Jr., in charge of the Landscape Department, is under orders for transfer elsewhere as a flying observer and official painter. When he leaves he will carry with him an aerial picture of Kelly Field just completed, the first canvas painted by an American using an aeroplane in the air as a viewpoint.

For several weeks Sgt. Adams has been flying daily as an observer to obtain sketches for the painting which will hang in the office of the Director of Military Aeronautics, Washington, D. C.

Enlisting in September, 1917, Sgt. Adams served for a time in the North, then was transferred to Kelly Field, where he organized the Landscape Department, which has beautified roads and grounds around buildings all over the camp. He also designed the Italian Garden dancing pavilion at the Aviation Club, Flying Department.

Britain's Part

Mr. W. F. Massey, Prime Minister of New Zealand, last week, in giving a summary of notable happenings in regard to Britain's share in the war, which was altogether above her proportion, relative to the population, quoted the following figures as showing the Empire's tremendous effort:

Men in arms, 7,500,000.

Of these, England has given 4,500,000, or 60 per cent., Scotland, 8.3 per cent., Wales 3.7, Ireland, 2.3, the Dominions and Colonies 12, and India and dependencies 13.7.

Enemy aircraft brought down in twelve months: More than 4,000.

Bombs dropped on the enemy this year: More than 800 tons.

Raids into Germany in June: Seventy-four.

Naval tonnage: Increased from four to well over six millions.

Naval personnel: Raised from 145,000 to 420,000.

War expenditure to March last: £7,014,000,000.

altitude of 5,000 feet at 6:55 P.M. I circled around and made a good landing and was received by Postmaster Wm. B. Carlisle, Mr. Chas. Dickenson, President of the Aero Club of Illinois; Capt. B. B. Lipsner, Superintendent of Aerial Mail Service; Mr. Thos. Downey, Assistant Superintendent of Mails; Mr. James O'Conner, Director of the U. S. War Exposition; Mr. James Stevens, Secretary of the Aero Club of Illinois, and Mr. Augustus Post, Secretary of the Aero Club of America, who had come on from New York to witness the inauguration of the first aero mail service between New York and Chicago.

The Return Flight

The weather on the return trip was much better. I started from Chicago on September 10, at 6:26 o'clock A. M. I carried about three thousand pieces of mail. The weather looked so good that I expected to make a record trip. There was some haze on the ground, but not nearly enough to prevent landmarks being distinct. Just as I was over Cleveland, I found a broken connection in the radiator and I landed there to have it repaired. This took some time, but I got away from there by 4:30 P.M., in time to make a pleasant flight to Lockhaven, one of the scheduled stops, before dark, a distance of 210 miles. I stayed at Lockhaven all night, leaving there at 7:20 the morning of the tenth. I arrived at Belmont Park at 11:22 A.M. As a pathfinding trip it was an immense success. We gathered a lot of information which will be very valuable in the future trips. The radiator trouble was the only thing that prevented me from making the trip within the ten hours set. If I had had a spare aeroplane even, I could have done it.

The First Trip

Pilot Max Miller is the first aviator to make the round trip, New York-Cleveland-Chicago-Cleveland-New York. On his arrival at Belmont Park, he made his report, and just one hour later started back on a flight to Washington, D. C.

Mr. Miller carried letters from Mr. Wm. F. Brooks, President of the Aero Club of Minneapolis, addressed to President Wilson in Washington, and Mr. Alan R. Hawley, President of the Aero Club of America, which has been brought from Minneapolis to Chicago by air, by Col. C. K. Rhinehart.

Mr. Miller left almost immediately for Washington, to carry the letter to President Wilson at the White House.

Mr. Miller says that the Aerial Mail Route to Chicago is entirely practical and feasible, and can be regularly maintained on a ten-hour schedule when relay aeroplanes are available at the different stations, or large aeroplanes with double motors are available for crossing the mountainous districts and where landing places are not easily found.

He found the air very good on his trip, and the winds were generally favorable. It was slightly hazy, but he could see the ground very well. The conditions which they encountered in going out were exceptionally stormy and such as would not ordinarily be met with.

STATEMENT OF EDW. GARDNER, AERIAL MAIL PILOT No. 2

I LEFT Belmont Park at 8:50 A.M., Thursday, September 5, 1918, two hours after Max Miller had started in a Curtiss R plane with a Liberty Motor, taking Radel, who was Miss Katherine Stinson's mechanic, with me, and carried three pouches of mail, containing about 3,000 letters.

The weather was very thick and the clouds were low, and I could not see the ground after attaining my altitude. I kept on my compass course, 284 degrees, and allowed for the drift of the winds. When I judged I was near Lockhaven, I came down and saw the river and two railroads at Bloomburg, and I knew that I was near Lockhaven. I kept on in the direction of Lockhaven, and very soon I saw through a split in the clouds a large new club house being built, and I saw a great number of people on the field, which I knew to be the Aerial Mail Station. I landed at 1:50 P.M., and spent 35 minutes in mending a broken gas line. Mr. Chas. A. Jobson, of the New York and Pennsylvania Company, did everything possible for me there, and I got away in the direction of Cleveland at 2:25 P.M.

I went on over the mountains in a terrific rainstorm and head winds, keeping the compass course of 283 degrees right over Franklin, and I was able to keep right on the course until I saw the race track just outside of Cleveland and the chimneys of a tile factory to the left, and beyond the landing field. I circled the field for some time, landed, and stayed there overnight.

Postmaster Wm. J. Murphy, of Cleveland, sent a message to Postmaster Wm. B. Carlisle, of Chicago, reading as follows:

"The people of Cleveland extend their most cordial greetings to the people of Chicago, appreciating that the Aerial Mail Service will increase the efficiency of the Post Office Department, and bring Cleveland, New York and Chicago into quicker and closer relationship."

I left Cleveland the next day and flew through to Bryan, where I arrived at 5:15. I met Postmaster Jordan, of Bryan, who was very enthusiastic and helped me on my way. I left at 5:50 P.M., and thought that I could get through to Grant Park before dark, but as I had not been on the field and knew that there was a great crowd of people at the War Exhibition and it was too dark to see, I landed at 7:20 at Westville, Indiana, 10 miles south of La Porte, and put up for the night. I left in the morning at 6:39 A.M., and flew across the southern end of Lake Michigan, landing at Grant Park at 7:30 A.M., where I found a warm reception awaiting me from Capt. B. B. Lipsner, Superintendent of Aerial Mail Division; Mr. Chas. Dickinson, President of the Aero Club of Illinois; Mr. Jas. Stevens, Secretary of the Aero Club of Illinois; and Mr. Augustus Post, Secretary of the Aero Club of America, who were on hand to welcome Radel and myself.

The arrival of the Aerial Mail at Chicago. Max Miller, Aero Mail Pilot Number 1, being greeted on his arrival with the first aero mail carried to Chicago. He is shown above (left) with Captain Benjamin B. Lipsner, Superintendent of Aerial Mail Services (right). Below are, from left to right, Mr. James S. Stevens, President Aero Club of Illinois; Mr. Dunlap, a pioneer aviator; Mr. Wm. B. Carlisle, Postmaster of Chicago; Mr. James O'Connor, Director of U. S. War Exposition; Augustus Post, Secretary of the Aerial League of America, and representative of the Aero Club of America. On the left are seen Captain Lipsner's sister and sister-in-law

Chicago to New York in One Day

I am glad that in my return trip I succeeded in making the Chicago-New York flight in one day. With spare aeroplanes it will be possible in the very near future to make the trip in less than ten hours, probably in less than eight.

I left Chicago September tenth at 6:25 A. M. with Ed Radel as mechanician, under fair conditions, and had no trouble in making Cleveland first and afterward Lockhaven in record time.

A month ago, with longer days, I could have made Belmont Park in daylight. I left Lockhaven at 5:51 P. M. and flew at about 7,000 feet most of the way. I never thought that I could miss Belmont Park, but night came along fast and it was impossible to distinguish one place from another. So, although I was over Belmont Park several times, I failed to land and continued flying over Long Island for close on to two hours when I was finally forced to land by a shortage of gasoline. I landed in a field close to Hicksville, Long Island.

As soon as arrangements are made to have electric lighting installed at Belmont Park field, flying at night will be fairly easy and it will be possible to start out or land before daylight or after dark at night, without any trouble.

I am told that I beat the best time of the fastest train from Chicago to New York by over ten hours. I am glad of it and am sure that in the very near future we will make the round trip in less time than is at present required by train to go one way.

Waiting for Gardner at Chicago

Mr. Max Miller was entertained at the Union League Club by Mr. Chas. Dickenson, President of the Aero Club of Illinois.

The mail was rushed to the Post Office in a special automobile and sent out by special messengers and delivered immediately. The Reception Committee waited on the grounds until they could hear from Edw. Gardner, who had left New York after Max Miller and was reported to have left Bryan at 5:50 P.M., that same afternoon, and was expected to land at Grant Park. Flares were prepared and lit on the field to enable him to make a landing, but a telephone mesage was received that he was forced to land at Westville, Ind., 10 miles south of La Porte at 7:20 P.M., and would come in the morning as the field was new to him and there were great crowds of people on the grounds, who had assembled to witness the Government War Exhibition. He arrived Saturday morning at 7:30 A.M., carrying 3,000 pieces of mail from New York City.

Saturday afternoon, Max Miller, Aerial Mail Pilot No. 1, took up Postmaster Wm. B. Carlisle for a beautiful flight over the City of Chicago and over the Federal Building, where the Post Office is situated. The Postmaster expressed himself as an ardent advocate of aeronautics and predicted that aerial mail service would be of tremendous value to merchants in the West when the regular aerial mail lines in all directions were fully established.

Max Miller started back from Chicago at 6 A.M. Monday, September 9, carrying 150 pounds of letters, making the run to Bryan, 160 miles, in one hour and five minutes, landing at 7:45 A.M., and continued his flight eastward at 7:50 A.M. He was forced to land five miles from Cleveland. at Woodland Hill Park, at 9:40 by a leaky radiator.

The AIRCRAFT TRADE REVIEW

A. E. J.

Dope Making Plants Nearly Ready

Washington.—Eight chemical manufacturing plants, built for the Bureau of Aircraft Production, estimated to cost $7,000,000, are now nearing completion. They will produce the necessary ingredients used in the manufacture of "dope" for coating aeroplane surfaces, immense quantities of which are used monthly, last month's supply alone running into 200,000 gallons.

There are two principal types of "dope" now in use in the U. S. Air Service: cellulose nitrate "dope," used on training planes, and cellulose acetate "dope," used on all planes shipped overseas. Acetate "dope," when properly made and applied, is believed to give a better, more permanent and less inflammable coating than nitrate 'dope." The characteristics of acetate "dope" are important in connection with the use on combat planes which are subjected to attacks with incendiary bullets.

Early in the preparation of the air program a standard "dope" was adopted and steps were taken to overcome the shortage of the ingredients and chemicals for the manufacture of cellulose acetate "dope." To-day, American plants, operating for the chemicals section of the Bureau of Aircraft Production, are turning out such materials as acetate of lime, methyl alcohol, acetone, glacial acetic acid and methyl ethyl ketone. From these materials "dope" is manufactured by several firms throughout the country for release through the chemicals section to plane manufacturers, aviation schools, fields and supply departments in this country and abroad.

The general method of doping the wing surfaces is to apply three or four coats of the "dope," intervals of several hours elapsing between the application of each coat. Because of the volatile nature of the thinners of solvents used to dissolve the "dope," the liquid portion evaporates quickly and the air in the vicinity becomes laden with the slightly injurious vapors of the solvents. On account of this evaporation the major portion of the solvents is lost, but steps have been taken to preserve the health of the workers and also to recover the solvent. Approved methods for recovery now make it possible to save from 50 to 85 per cent of the solvents lost during the process of doping and drying. Special "dope" containers are also provided which will reduce evaporation.

British Output of Aeroplanes

Writing in the War Anniversary Supplement of *Overseas*, Sir L. Worthington Evans, late Financial Secretary to the Ministry of Munitions, says: "British factories are now making in a single week more aeroplanes than were made during the whole of 1914, in a single month more than were made in the whole of 1915, and in a single quarter more than were made in the whole of 1916. The output for the whole of this year will be several times what it was during last year."

New Foot Warmer for Aviators

An electric foot warmer for the use of aviators, truck drivers, etc., has been invented by W. W. Lillard, 274 Monticello Avenue, Jersey City, N. J. Mr. Lillard, an electrical engineer, is at present on active service, and the invention is being promoted by Ernest J. King, of the same address.

The equipment comprises an insole of the same general appearance as the common slip insole, except that it has two plugs at the heel, which project about one-eighth inch from the bottom. These plugs are the terminals for the resistance wires or heating unit which is imbedded in the insole. When the insole is placed in the shoe the plugs fit snugly in two small sockets which are sunk in the heel about one-eighth inch.

There are two different ways for conducting current to the contact sockets in the heel. One consists in having two narrow metal strips extend along the outside of the sole from the heel for the distance of about an inch, these strips being adapted to make contact with contact plates in the foot board. The other method consists in bringing two very thin wires down the back of the shoe inside the back stay to the contact sockets, connection being made at the top of the shoe through two small snap-fasteners which are barely visible. A thin wire is fastened to the inside seam of each trouser leg, extending to the waist, where connection may be made with the electrical source. In making connection in this way there is absolutely no wire to get in a person's way

It is claimed that a person equipped with this device may keep his feet as warm as he wants to, and that when his feet are warm his whole body is warm. The heating element is intended to be operated from a 6-volt battery, and as each heating element has a resistance of about 6 ohms, the current consumption is only one ampere.

Overland to Make Liberty Engines

Elyria, Ohio.—The Willys-Overland plant in this city has announced it will begin the manufacture of eight and twelve-cylinder Liberty engines. The plant will operate twenty-four hours a day, giving employment to more than 2,000 men.

Giant Plane from St. Louis

St. Louis.—W. E. Workman, general manager of the Handley-Page Aeroplane Manufacturing Co., delivered a talk to members of the Chamber of Commerce at a luncheon in which he told of factories to be built in this country. Immediately after the luncheon a movement was started to raise $50,000 to build a giant plane here to fly to the war zone, where it will be offered in service. Some progress has been made in raising the fund.

Personal Pars

E. M. Beach has been appointed to the position of inspection of the Bureau of Aircraft Production. He was formerly president of the Manufacturers Foundry Co., Waterbury, Conn., and also a member of the Board of Directors and Executive Committee of the Motor and Accessory Manufacturers Association.

B. A. Guy, secretary and assistant general manager of the Curtiss Aeroplane & Motors Corp., Buffalo, resigned August 15.

A. B. Walker has resigned as representative of the Budd Wheel Corporation, Philadelphia, to join the staff of the Bureau of Aircraft Production. He has left for an Eastern station.

Orrel A. Parker, formerly manager of the wheel department of the Hydraulic Pressed Steel Co., has gone to Washington to engage in government work. He is in charge of records under W. F. Parris, chief of the oil and lubrication branch, supply section, in the office of the director of military aeronautics.

Increased Their Equipment

Continental Auto Parts Company of Knightstown, Indiana, has recently increased its capital stock from ten to fifty thousand dollars, and is now making extensive additions to its plant and installing additional machinery and equipment in order to take care of its Government contracts.

The company manufactures a line of shop and factory equipment and it has been necessary to greatly increase production on the Continental Motor Stand, which is being used by the Department of Military Aeronautics, the Navy, Quartermaster and Ordnance, and the various manufacturers now making aeroplanes, trucks, tractors for the United States Government.

List of Purchase Contracts Made by Bureau of Aircraft Production

The following is a list of purchases contracted for by the Bureau of Aircraft Production:

[NOTE.—The first number at the beginning of each paragraph is the Order Number, the second is the Contract Number.]

730146. 4414. Zenith Carbureter Co., Detroit, Mich., 50 sets No. 48 D. C. carbureter and spare parts for the Hispano-Suiza 150 horse power, Type A engine.

730147. 4415. The Silver Co., South Bethlehem, Pa., 25,000 spark plugs for use on Hispano-Suiza Type A, 150 horse power engine.

August 3, 1918

30035—A—1. 2129—3. Ford Motor Co., Detroit, Mich., spare parts according to "M" and "L" lists for 5,000 Liberty engines.

180007. 4413. The Simplex Wire & Cable Co., Boston, Mass., 3,000 miles field wire.

710107. 4423. Eastman Kodak Co., Rochester, N. Y., 50,000 gallons cellulose acetate dope.

710108. 4425. Standard Seamless Tube Co., Ambridge, Pa., 70,500 feet seamless steel tubing.

710109. 4421. Bordentown Steel & Tube Co., Bordentown, N. J., 54,500 feet seamless steel tubing.

720214. 4424. B. F. Goodrich Co., Akron, Ohio, 10 supply balloons.

August 15, 1918

140024. 4426. W. N. Matthews & Bro., 620 Southern Building, Washington, D. C., 5,000 breast reels, without spool.

370100. 4429. Wayne Oil Tank & Pump Co., 1337 Meridian Place, Washington, D. C., 93 portable oil tanks.

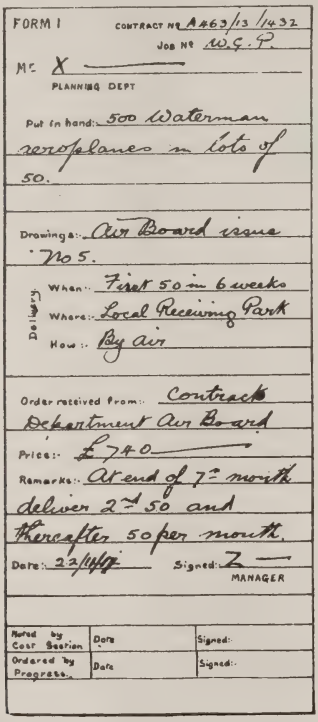
470115. 4432. J. C. Pushee & Sons, Boston, Mass., 20,662 brushes.

480048. 4438. Continental Car Co. of America, Louisville, Ky., services in connection with crating 350 machine-shop truck bodies.

710104. 4420. Standard Aircraft Corporation, Elizabeth, N. J., 60,700 feet gauge seamless steel tubing.

720218. 4431. Curtiss Aeroplane & Motor Corporation, Buffalo, N. Y., 40 sets wings, upper and lower, right and letf, complete.

750027. 4428. Unit Construction Co., Fifty-eighth Street and Grays Avenue, Philadelphia, Pa., 2,700 air fans for driving 100-watt generator used on radio telephone combination transmitting and receiving set.



A view of the interior of the Springfield Aircraft Company's factory

SHOP ORGANIZATION: A SIMPLE SCHEME*

By W. E. JOHN

IT is my object to sketch the outline of a scheme for the organization of a factory. I neither pretend, nor is it my aim, to exhaust the subject, but shall apply the scheme to a modern factory, and hope so clearly to outline it, that it may be at least of some interest to the members. I may add that I have assisted in the mapping out and starting of two or three schemes or systems of organizations in England. A few days ago I was glad to read in a letter from an old "half section" of mine—a manager of a well-known motor-car factory and now engaged on aeroplane engines, high explosive shells, motor war lorries, etc., in which he says, "It would do your heart good to see the easy and complete way the system which cost us so many long hours

hammering out last year is now working. Visitors from other factories are frequently coming to see it in operation."

In order to illustrate the working, and in particular the flexibility of the scheme, I shall consider it applied to a factory producing aeroplanes. It will be sufficient if we consider the engine to be supplied complete and the machines made to Government orders.

At the beginning, it must be clearly understood that for successful control we must have management, and that means the existence of a real manager.

As is the manager, so will be the firm. If the manager does not take his own medicine—or, in other words, does not obey his rules, *i.e.*, the rules of the factory, framed and posted under his signature—then the whole concern will show lack of control. A manager's great qualification for his post should be that he can manage.

This question of management cannot be too strongly put. A manager to manage men must be a man in every sense of the word.

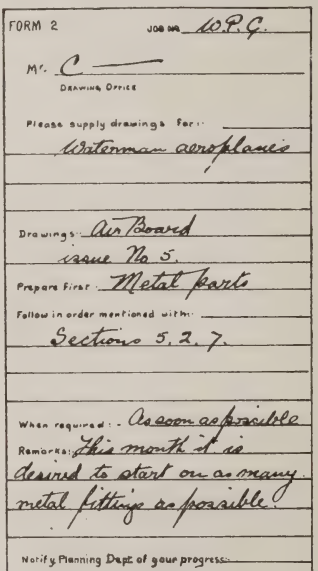
Now to the scheme; in the smallest or the largest concern, we must have a planning department. In the smallest concerns this department may occupy but a small part of the manager's brain and have very little visibility, but in a concern of any magnitude the planning department is very important.

The department should be divided into two sections—the commercial section and the productive section—or, more conveniently termed the costing section and the progress section.

* Paper read before the Aeronautical Society on March 14, 1918.

We have a cost department and sometimes a progress department in every works, but too often they are at loggerheads and have little in common with one another.

The man in charge of the planning department should have had a sound broad training and have ample initiative to meet emergencies. He should be capable of uniting the cost to the progress of the work. He should, of course, be strongly backed by the manager.



Aeroplanes are admitted to be a very difficult product for a factory, because of the number of parts of widely different materials which go to make up the complete unit, and because of the constant minor changes which are occurring in their design. They are, however, not unique in this latter respect, as those engaged in the production of various other munitions can testify.

We shall assume that an order has been received for 500 aeroplanes to be delivered in lots of 50; also that the price is considered satisfactory and that the factory is in a position to execute the order. We will call the aeroplane the "Waterman" type.

Once the order is received—through the post, by telephone, or otherwise—it must at once come to the manager, who should himself sign the order to the planning department for the work to be executed in the factory.

The order signed by the manager should be in duplicate, one copy for the planning department and one for the file.

It will be noted that the Government order number is dropped for obvious reasons and a factory number substituted, and, for convenience,

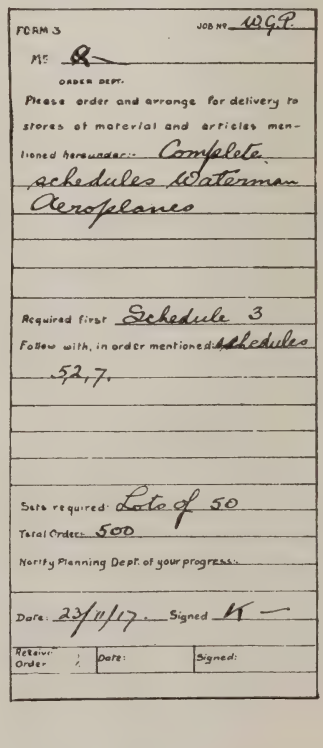
each 50 has its proper symbol. WGP in lots of 50 will mean, to the initiated, an order for "W" type machines. G.H.I.J.K.L.M.N.O.P. lots of 50, or a total of 500. The first lot of 50 will be "WG," the second "WH," and so on.

For convenience in handling and filling, all forms in use should be on the same size card or paper. They may, however, be distinguished by different colors. If the factory uses a system of time cards and clocks, with a card measuring 7 in. by 5 in., this size should be used for the order forms, for reasons which will be apparent hereafter.

The cost section of the planning department should first receive the order, and should at once open an account and make notes of the various particulars of importance to them. Having done so, the clerk responsible for the entry should sign and date the order.

The planning department now proceeds to justify its name, and at once arranges for production to commence in the works. In the first place, arrangements for the drawings should be made.

The whole machine is sectionalized—wings, fuselage, undercarriage, etc., forming each a section. Preferably, the sections should be limited to nine, to fit in with the numbering scheme hereinafter dealt with. A section of the aeroplane is next selected, preference being given to the section which will take the longest time for its production. It is minutely sectionalized and its parts properly scheduled. A copy of this schedule should be sent to the order office.



The parts which require to be bought outside complete are clearly marked on the schedule. It will be the duty of the order department to see that the rough material is actually in the stores at the earliest possible moment. The order department must clearly recognize that their duty does not terminate with the ordering, but with the actual delivery. They will also keep the planning department advised of their progress, item by item, if necessary. It is quite possible that a lot of material required for the job is already carried in stock, and the order department must advise the planning department of the position in this connection.

Meanwhile the planning department should have mapped out the production and allocated the work to the various departments. Forms for the production of each item, and in a number of cases, the part production of each item, are prepared. In fact, every operation of each part is provided with a written order. This may appear to be a stupendous task, but a moment's consideration will show that it is always done, but that, in a large number of cases, the work of wiring these forms is scattered throughout the works, such as at the desks and offices of foremen and charge hands.

These order forms are preferably made out in duplicate, one copy is filed and the carbon copy is conveniently made on the beck of the clock job card above referred to. The number or name of the department in which the work is done is filled in, and in fact every other item, of course, left to the discretion of the foreman. An order for the material required from the stores is also made out and attached to the production order.

It will be noted that there are two stores mentioned. (1) The rough stores, and (2) the departmental stores; the nature and reason for these stores will appear later.

The foreman in the department concerned will

Received by Order Dept. | Date: | Signed:

be furnished with these orders by the planning department whenever the latter arrange for the work to be done, but never before they know that the requisite material is available in the stores. As the men under the foreman require work, he will fill in their number (or name and number if required) on the forms, and hand same to them. They will "clock on" the back of Form 5 and take Form 6 or 7 to the stores, draw the material and sign the receipt for same. On the completion of the job, the parts completed will be delivered to the proper stores and the receipt for same signed. All forms will be returned to the planning department, so sonn as they are completed, and the duplicate on file can then be destroyed. Until destroyed, these duplicates form a record of the work in progress and an automatic check against the loss of any job.

Where the rule exists to check and balance the job and time cards weekly, it will be necessary for the foremen in the different departments to have duplicates made of all job cards carried over to the following week and the card so continued should be suitably marked, preferably they should be of a different color to the ordinary job card. In this case also, all job cards will pass through the timekeeper's department for checking with the time cards before they go back to the planning department.

Should any "scrap" be made, extra material would be requisitioned through the planning department, who may issue a further order on the stores. Preferably, such orders should be on a distinctive colored paper, so that they may be picked out as orders for replacement for "scrap." Too much attention cannot be drawn to this matter if economical production is to be attained.

In order to record progress of work, use should be made of some chart. A convenient size for the card is 8 in. by 5 in. Some cards should have extra space on the back to accommodate components having an exceptional number of parts, or duplicate cards may be used for the same purpose.

Full information regarding the component and its proper classification is provided on the top of the card. The items are enumerated and, if necessary, the drawing number of each is given. A number of spaces is provided opposite each item and these are used for the different operations. The first column is headed "Stores," and the other colmuns are for the various departments in which the operations are to take place. Each department is conveniently indicated by a number permanently assigned to it. The number indicating the department should be written in red ink as large as possible. See Form 8.

Each space is divided by a horizontal line and each space so formed is again sub-divided by a horizontal and four perpendicular lines, thus providing two blocks of ten small sections to each space.

Shading with lead pencil the ten sections at the top of the horizontal line will show at a glance that the total number of the particular items called for have been received by the department indicated; whilst the shading of the sections below the horizontal line will indicate that the work on the items has been completed in the particular department and deposited in the proper stores, and that the job card has duly returned to the planning department. The date on which the particular movement of the item occurred, may be noted in ink over the shading. If, for any reason, the requisite number of any item is not received or produced by any department, the position can be shown by the number of sections shaded or parts of sections.

For instance, department 1 received material for the production of 200 side plates; owing to "scrap" 180 were produced, consequently only nine of the ten sections are shaded. As the "scrap" is not to be made up, the 180 are passed on to department 9, and this is shown by the shading of nine spaces only. Department 9 also makes "scrap" and thereby loses 10, consequently only 8½ sections are shaded, showing

170 side plates passed on by this department.

Referring again to the first column, *i.e.*, the stores record, the top spaces are shaded when instructions for ordering the material have been sent to the order department. The lower spaces are shaded when the planning department has been notified that the material is in stock. The date in this space should show when the orders for the work to be put in hand were sent to the shop.

If desired, the progress card may be smaller in size and one card assigned to each item. If this is done, a ready means is provided for seeing at a glance the amount of work in progress in each department. This will be described in detail later.

It is now necessary to mention the system employed for numbering the various jobs. This is an adaptation of the decimal system in use in some libraries.

No doubt members have had some experience of the long official numbers used by the Government to designate their contracts. A number like A463/13/1432 will serve for an example. To saddle a job, and all the parts of it, with a number like this, is asking for trouble. Its use means loss of time, worry through mistakes and consequent loss of output. I believe "every little helps" in the question of output, and that, whether one is to save time in the production of battleships, aeroplanes, or packets of matches, every moment saved is a moment gained. A few moments' thought will convince anyone acquainted with the records necessary in even a small factory, that the aggregate of the time wasted in writing the long numbers such as that mentioned above must run into days.

As already stated, my method is to give the contract a certain letter. A contract for a number of "Waterman" aeroplanes is given the letter "W" and if we sub-divide the number into lots of, say, 50 each, each lot is given a second letter as "WL." The unit required in the contract—in the example under consideration, the aeroplane—is divided into a number of sections, but not more than nine, and subsequent sub-divisions are limited to ten, and are numbered consecutively, as:—Wings 1, centre section 2, fuselage 3, tail 4, undercarriage 5, power plant 6, military equipment 7, struts and bracings 8, controls and instruments 9.

Each section is divided into components limited to ten. For instance, the military equipment section number WL7, is divided into:—Gun complete 1, magazine case 2, ejector funnel 3, control gear 4, bearers 5, wind screen 6, sight 7.

Each component is sub-divided into parts. Take for example the gun bearers. These, numbered WL75, would be divided into:—Arch tube bearers 1, stay tubes 2, side plates front bearer 3, side plates rear bearers 4, front longeron clips 5, rear longeron clips 6, fork piece 7, bolts 8.

Each part is further divided into items, thus the front longeron clips, numbered WL755, may be split into:—Front longeron clips starboard 1, front longeron clips port 2.

If desired, the division may be carried still further. The front longeron clip number WL7552, may be sub-divided into units:—Centre section strut socket 1, longeron plates 2. These are single pieces and cannot be further sub-divided.

The longeron plate will be numbered WL75522.

This is not a very large number, but in the most complicated pieces no greater number of figures should be required. A moment's thought will make it clear that the long numbers are used less frequently than the others since they only apply to the units. The job card for welding up the front longeron clip would be numbered WL755. But the man who assembles the gun bearers had a card numbered WL75.

Once the main sub-divisions are made they should remain as far as possible standard for all types of machines.

The advantages of the system will be apparent. A lot of similar small parts are found in the factory in an unfinished state. The number on the label attached to them, or the job card with them, is WL726. We know from "W" that they belong to the Waterman type of aeroplane. From "L," that they are on a particular order for these machines. The 7 shows that they are part of the military equipment. This information will probably be so near a guide to one who is used to the work, that he will at once recognize the part, but if not, the 2 will show that it is a part of the magazine case.

Of course, the same system could be used in connection with traction engines, agricultural implements, or any other machine or article of manufacture.

It is impossible to deal with all problems peculiar to each factory which may occur in the working of this scheme and for which special arrangements must be made. However, there is one point requiring a little explanation. A foreman very often will desire to put more than one man on a job. To meet this emergency, each foreman should be provided with a number of blank forms clearly marked, preferably by the use of a different colored card to that used for the original order. The foreman will be responsible for the form being properly filled up. These extra cards will travel through the works and eventually back to the planning department in exactly the same way as do the original forms which they supplement.

In some concerns it may be desirable to keep track of the work almost hourly, for example, when the work is carried on by more than one shift. To meet this requirement, the progress cards should, as above mentioned, be substituted by the small size cards recording single units.

Such card, say, 3 in. by 2 in. in size, is provided with at least two pilot index clips or flags. They should bear numbers to indicate the department to which they refer. At one side of the top edges of the cards is placed the proper flag indicating the department in which the work is in progress. The other flag on the opposite end of the top edge should bear the number of the department to which it next has to go. Further flags, colored red, may be used to mark jobs which have to be "rushed." Flags colored black may be used to show jobs temporarily held up for some reason or other. These special flags may be placed towards the centre of the top edges of the cards.

A box of cards indicating all the jobs at the moment in the factory will contain perhaps as many as 1,000, 10,000, or 100,000 cards, but will show at once the position of each department so far as work in hand is concerned.

This system, in a large shop, having a central stores, view-room or inspection department, acting as a pool between each operation, may easily be worked by the clerk checking jobs in and out of said pool.

Of course, the cards should be kept in proper order so that the position of any job may be ascertained at any moment.

A final davantage in this system will be found if two files or boxes for the cards are used. At the beginning of a week, or month, or any other period, an empty file is used. The first card to be moved, say, on Monday morning on a weekly system, is taken from the old file and placed in the new one. Any new cards coming in are, of course, placed and filed in proper order and with the proper flags in the new file. At the end of the week the old file should be very thin, whilst the new file should be corresponding full. Before starting the new period, the next week, the cards which have remained stationary in the old file should be removed and handed to the superintendent or manager, who would thereby have a positive and automatic means of seeing what jobs have remained stationary for the week. He can order any card to be replaced in the current file or otherwise dispose of same, as he thinks fit.

As a final warning, no system will be good unless the head man backs it and obeys it laws; every man, boy, woman and girl in the factory and offices should have their duties defined; each should understand as far as may be necessary the system of organization so that each one may assist to make the system so simple and complete that it automatically "runs itself."

Discussion

Mr. G. Holt Thomas (The Chairman) said the lecture by Mr. W. E. John on "Shop Organization" was a little departure from the usual practice of the Society, but a very necessary one at the present time. We had good designs in England, but it was no use having good designs without good production, or *vice versa*. The lecture was particularly opportune at present as he (Mr. Thomas) thought it would be impossible to organize any aircraft factory in England under the conditions which existed before the advent of the Air Board and the Air Ministry. It was impossible to organize without material, or if sufficient orders were not received, or if the authorities did not know what they wanted. But under the Air Ministry we had now departments for material inspection, and things had much improved. Another thing that stopped work was that the output of aeroplanes was formerly largely controlled by the number of times the Germans bombed London, the result being that works had to be doubled just when organization was contemplated. He thought that had now probably come to a standstill and that the present was a most opportune time for the discussion. He was always striving at organization, which, as Sir Henry Fowler would tell them, they had never got. The paper by Mr. John, he thought, would help them to obtain it. Sir Henry Fowler (Assistant Controller of Aircraft Production) said he was compelled to take part in the discussion by the remarks the chairman had made. They must all appreciate that there had been no more difficult matter placed before the engineering world than the construction of a machine like the aeroplane, which was developing almost from hour to hour. In time af war it was absolutely necessary to give the fellows who were fighting and risking their lives for us the very best. From time to time something happened which pointed out that some slight alternation would give advant-ages, and that was one of the most damning things that could happen from a constructional standpoint. Mr. John had not put down for absolute comparison what would happen to his second set of figures if there were more than nine parts in any of those sections into which he had split it up. He would have found himself running in competition with the long figure he had given as an example of a shop number used in another system. Mr. John had shown them an excellent example of the kind of man it was necessary to put into the shop with his proposed organization. The manager must be whole-heartedly on the job. A fellow who had had to deal with a more simple proposition said this organization was needless, and he got through his work, but not in the time he ought to do. There was not only the difficulty with the managers and the foremen, but also with the men themselves, who thought if they left out a number or put in an extra number or a wrong number they would be paid just the same, and it was a matter of difficulty and patience to teach them to use the system. Anyone who had had to deal with aeronautical work had realized the importance of such a system.

Major Heckstall Smith said the system proposed departed from the majority of the existing organizations, but the departure was a good one. It established the great importance of a planning department and of dividing the work up into small sections. It was a great thing to divide aeroplane works up in that way, and it was not done universally. The author put the costing department under the planning department. Would he say why he had done that? He (the speaker) had hoped that he would have gone further into the real valuable functions of that department, as it was the brains of the works. Highly skilled people must be employed in that department, otherwise they would do more harm than good, and its personnel was the most important of the whole works. He took it the author meant the planning department would not act in the old fashion that used to exist when the foreman gave instructions to the workman as to how work was to be done—it still held in many works in England—but that the planning department took away from the foreman the clerical and instructional work he used to do and only left to him the selection of the men and the watching of the work of the men. Would the lecturer give a few words on the primary functions of the planning department and the class of men he would employ?

With regard to checking the work in progress and the material he did not agree with using quite such small cards for watching material which came in in driblets, or for the progress of the work. They wanted something large to hang on the wall and which would hit you in the eye, and a color scheme might show whether you were up-to-date, the work behind being indicated by red and the up-to-date work by black. Supposing the planning department had put the work through and the progress department was told to watch for a certain number of items every day or week, and when the progress sheet was passed one would see whether the articles were or were not coming in and would indicate by red or black whether the foremen were up-to-date with their promises or not. Otherwise he approved of the scheme, which was an excellent one.

Captain Hiscocks, R.F.C., thought the paper should show the conditions applying to the works into which the author was putting this organization; also the size of the works—500, 5,000, 50,000 hands—was a consideration. Did the author make the whole of the aeroplane in his own works, or how much did he buy outside? For a works of 500 men the system was a suitable one, but with 5,000 men the paper record would be so large that the whole thing might fall to pieces, and he would have to change over from a paper progress system to a minimum and maximum stock system, which would be more accurate. The dividing up of aeroplanes into main parts and groups seemed to him to fall to pieces in some respects. There might be half a dozen orders in the shop for manufacturing the same parts, and probably the foreman would overlook them and put them through in half a dozen batches instead of one batch. There were many parts which it did not pay to put through in batches of 50; they would have to be put through in batches of 500 for economical production.

The progress charts did not take into account that a large number of parts might have been withdrawn for spares, emergency orders, etc., and that threw out of balance the progress sheets, and the progress sheets could not show exactly where all the different parts were going. They might show what was coming in, but they might be withdrawn from the stores and certain parts might be found short when one came to the finished aeroplane.

Mr. E. C. Gordon England said there was a great tendency to view organization from the point of view of organization, and not from the point of view of the work about to be tackled. A system could apply to a small or a large works equally, provided the main thing was kept in mind—viz., the job to be produced. The organization should center round that, and not round the works of the men employed. Every branch of engineering required a special organization, a different one being required for aeroplanes from ships. A point which upset him was the question as to how one dealt in Mr. John's system with any one part, as it appeared in these days of standardization that that part would have several different numbers in the one machine. One of the main things to do was to cut down the different references to one item to an irreducible minimum, otherwise, a field was opened up for enormous error, because the foreman would be greatly upset

THE LONDON EXHIBITION OF ENEMY AIRCRAFT

By G. DOUGLAS WARDROP

IN arranging the exhibition of enemy aircraft at Islington, London, the Technical Department of the Aircraft Production Department of the Air Ministry have done the British aeronautic industry and the Allied air service a distinct service by making available for inspection the latest enemy developments. Through special permission of the Air Ministry AERIAL AGE was permitted to visit the exhibition and to make complete notes concerning the machines, engines and accessories for the benefit of the American aircraft industry.

The arrangement of the various exhibits is excellent. To facilitate examination the machines are stripped from one side of the center line of the fuselage, and left covered, as in flying condition, on the other, this enabling one to gain an impression of the general appearance of the machine, and also the internal details of the planes and fuselage. In most cases the machines are shown minus engines, this being rendered necessary by the fact that, owing to the methods of construction generally adopted for the fuselage, the stripping of this item detrimentally affects the strength of the structure.

The engines are shown in a separate section, and include an example of almost all the types of motors employed by the enemy. In this section there are two motors of each type, one completely set up, and the other dismantled and sectionalized for the closest inspection. This is of immense value to the student of the principle and practice of aero-engine construction. The most striking lesson here is that, no matter what one's views may be concerning enemy aircraft practice, it is very evident the motors, as exemplified by Mercedes, Benz and Argus, have been developed to a stage of great reliability. Engines of a very recent date of construction are shown, and the falling off in finish which might be expected of the manufacturers in a country which would logically be expected to be under considerable duress, is undistinguishable. The workmanship is excellent, and the metals, with but one or two exceptions, are of a high grade.

The total weight per horse power and the performance generally of German aero engines are not of extraordinary merit. As a matter of fact they are a fairly light weight per horse power, higher considerably than has been accepted in Allied engineering channels as desirable.

Reliability has been the sole goal of the constructors, and the records would indicate that they have succeeded in no small measure. In the exhibition are shown the 120-, 160- and 260-h.p. Mercedes; the 160- and 120-h.p. Benz; the 120- and 220-h.p. Benz; the 120- and 200-h.p. Argus, the 110-h.p. Oberursel and the Maybach airship engine, concerning all of which we shall have something to say in subsequent issues.

With the exception of the Oberursel (which is a German modification of the Gnome), all the types of engines were in use before the outbreak of the war, but it is worthy of note that whereas now the dominating motor is the Mercedes, before the war the majority of the German aeroplanes were engined with Argus and Benz motors.

The various aeroplanes shown demonstrate very clearly the chief characteristics of the German aircraft.. The types shown include the Aviatik, L. V. G., Albatross, Ago, Hannover two-seater, Halberstadt, Pfalz, Albatross D1, Albatross D3, Austrian Berg, Fokker triplane and Friedrichshafen bomber. The latter is twin-engined and fully rigged, 78 feet span, with 260 Mercedes motors.

This bomber is one of the most interesting types in the exhibition, and affords some new examples of constructional details. In addition to the complete machine there are also parts of similar machines, showing to greater advantage the various span and strut sections, details of wings, controls, tanks and metal fittings generally. All of these we shall deal with in detail.

There is a representative collection of instruments, machine guns, bomb dropping devices, and aviators' clothing equipment.

In a cursory mention of building practice there are a few things that stand out noticeably. For instance, there is an extensive use of plywood, the laminæ varying from three to fourteen, and in thickness from 1/32d of an inch to 1 inch. It is used for built-up box wing spars, ribs, leading edges (very considerably), brackets, supporting engine bearers, and almost without exception for the body covering. There is a pronounced tendency towards the use of steel tube for all control surfaces, and also for the under-carriage. In many cases oil and gasoline tanks are made of brass. The fabric used seems to vary in quality very decidedly, and some of the machines are indeed very poor. The use of helical coil springs as shock absorbing media might suggest a scarcity of rubber.

A noticeable detail of enemy design is the method of washing out the wing tips, until, in most cases, this portion of the wing forms a negative angle to the horizontal. Perhaps it is due to the early influence of the Etrich or Taube monoplanes. While the modification of Etrich tip has still been retained, the sweptback type of plane has been entirely superceded by the plane of rectangular plan form.

In some of the types the great care taken in forming a good entry to the fuselage, by the attachment of a revolving spinner to the propeller, is nullified by the exposed radiators, water pipes and exhaust manifolds.

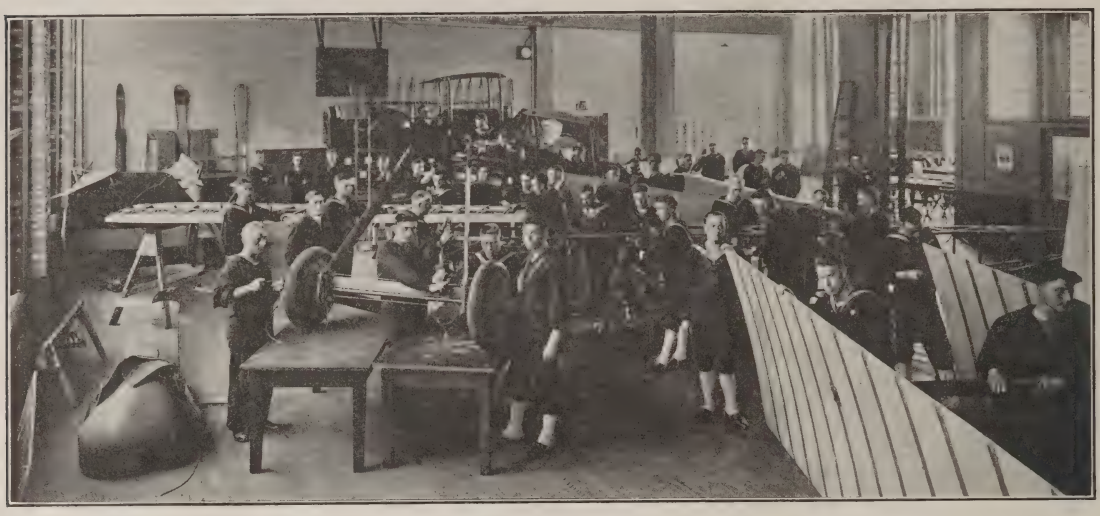
In one or two of the more recent German machines, however, the radiators are of the flat-tube type, and are mounted in the center section of the top plane, conforming in shape to the wing section.

The workmanship in the various machines is of a very varied nature. But in none of the machines shown does it call for ultra-favorable comment, while in one or two it most decidedly would not pass muster here.

But the notes which will follow this article will be of considerable interest to American aeronautic engineers.

---

by the fact that one part was known in the works by three or four different numbers. If it were reduced to one everybody would always recognize it. There would be less errors on the clerical side, and less mental effort would be applied to remembering and identifying that part. There were great risks if a part had several different numbers or references of putting those parts through separately instead of in one bunch. He suggested that the best method of dealing with those parts was to let the planning department put them through as parts of a whole order, and not with reference to any one section. That would obviate setting up a machine to produce a few of them and then breaking down the machine and setting it up for some totally different article. The first duty of the planning department was to see how much labor they had under any one head in the works. For example, how many skilled men or unskilled women they had on any one operation. They could then state definitely what their output of any one article could be, and it enabled them to balance the whole works in such a way that no one section would be producing more of one article than was required to balance the production of the various other items in an aeroplane. He found that practice was possible and that it paid.



Mr. R. Borlase Mathews said he would like a little more information as to how the lecturer used and applied his cotsing. In many works the costing figures were not available as quickly as they might be to serve their turn in reducing the cost of production of further batches.

He had been interested in mechanical methods of calculation, and one of the best examples he had seen was at the R.A.F. works, which Sir Henry Fowler lately controlled. They had a system of machine whereby detailed costs could be analyzed rapidly. Such machines were known as the Burroughes machine, which was used for the wages portion, but for the works analysis and costs of operation the Powers counting machine carried the thing out in careful detail. He would have liked greater detail as regarded the planning of the work along the line of putting what might be called more brainwork into the arrangements for facilitating the work of the foreman and the men. That was an application of what was known as Taylorism in workshop management. As regards the woodworking portion of aeroplanes, there was great scope for the use of jigs in the manufacture rather from the view of the management—that is preplanning—rather than letting the planning slide to a later time when the work actually got into the shops. The lecturer had remarked that he went ahead with the work if the order received were satisfactory. That reminded him that some American firms if they found the price was not satisfactory re-designed the job, but possibly the Air Board would stop that sort of thing here. He had used the decimal system of classification in engineering for fifteen years, and found it very useful. He had even introduced it into the Air Board, which was rather apt to act on conservative, War Office lines. He divided the aeroplanes into nine parts and one general miscellaneous part, and took them alphabetically. The parts were armament, ballast, engineering fittings, fuselage, instruments and fittings, landing gear and anchorage, main planes, tail, tanks and pipes. This system of numbers was not appreciated quite as it might be in this country, and it was most useful that a number instead of being a mere number should tell something definite about the thing being dealt with. In America and on the Continent they had this system in use more generally than we had in England. The question had been asked how one managed if the article were only divided into nine parts? But when one knew the system it was not difficult. There was a standard size bolt used on the main planes, fuselage, or anywhere else. It went on a quantity basis, and it was a thing with regard to which the planning department would have started out on that basis. Works that produced bolts of a certain size on a batch basis would not show evidence of much brains in the planning department.

Mr. W. E. John said with regard to the remark about dividing into nine sections, anything could be divided into less or up to nine different sections. He did not use ten because the "O" was a figure the workman did not like. The workman, if he had no experience of decimals, dropped the "O" if it began a number. With care, anything could be divided into nine. He was asked by a lady in one of the factories, who had charge of the filing of the correspondence, to adapt this for her filing, and he found one could divide her filing into nine main sections, and from that it was again divided into ten, and the sub-division increased as far as necessary. Sir Henry Fowler referred to the fact that the above system would be up against having the wrong numbers put on the job by the men. In the system he had sketched every order was written, in the first place anyway, by the planning department, and if there were any copies it was due to two men being put on one man's job, to meet an emergency. It was a plain copy made by the foreman, and if the number was dropped or there was anything wrong with the copy it was not hard to trace it when it came through the shops, because they had the original which was made out by the planning department.

Another speaker asked why the costing section was put under the planning department—why the planning department was divided into cost and progress. It was really the obvious thing to do. The cost had to be cut to fit the cloth, and the planning department should have some say in the way the progress of the job through the shops was planned. The type of man he would put in charge of the department would be a man who had served an apprenticeship and had very wide experience of the actual production in the workshop. It was very difficult to get the right man, as apprentices were not often good office men. The man must have passed through the real details of a factory and know something of accountancy or costing.

Major Heckstall Smith said he wanted his records posted large, but this meant papering the walls of a very large room. The number of jobs in an ordinary factory would want a lot of room to be readily visible at the same moment. A scheme of this kind used to be in operation at a place where he worked at the time in the West of England. They had a system of flaps, such as were used for advertising postcards, and these were used to show the different positions of jobs. With regard to small parts of aeroplanes being numbered twice over, wood screws, for instance, were used in all parts. Few aeroplane factories would produce these screws. That would be a stock job. If the numbering scheme were to be applied to small parts bought inside or small clips, or anything used in quantities, they would give it "Sk," which meant "stock," and number it accordingly. It was true that spares came in and that there were emergency orders, but if an emergency order came in for fifty sets of wings it should not interfere with the original contract, which went on just the same. The emergency order was put through separatel,y and the right clip put on it, and it was sent as a separate order through the whole organization. Coming back to the stock, the screws might be different sorts, and after "Sk" one could add the figures 1 for round head, 2 for counter work, 3 for metal thread or anything else. If it were a wood screw it might be No. 8 or start in any size which was suitable to the factory, so that the "1" might be divided into 1, 2, 3, 4, 5, and so on, for different carieties. Or one might use 1 for iron and 2 for brass, and then divide those numbers into 1, 2, 3, and so on. They knew No. 1 was a round head, and if it was 11 it was iron right through. This could also be done with turnbuckles or anything else used in quantity.

The big gymnasium at Dunwoody has been turned over entirely to the aviation classes. Here the students assemble and dismount, rig and repair

MAKING NAVY AVIATORS IN A HURRY

By WILLARD CONNELY, U.S.N.R.F.

AMERICA had been in the war about two months when Ensign Colby Dodge, U.S.N., conceived the idea of introducing naval aviation fifteen hundred miles inland. At that time he had been ordered to duty in Minneapolis, where he was instrumental in starting the Dunwoody Naval Training Schools, now sending to the fleets four thousand expert craftsmen annually. To local civilians he proposed an aero club, to back a unit of pilots. The club was organized with a rush, but like all our war preparations it took some months to gain momentum. The first class of student officers went in April to Boston Tech for examination. All passed with "flying" colors, meaning among other things that they doffed their blue jackets for the forestry green uniform of the air corps. Then they were detailed for solo flight practice to Atlantic and Gulf air stations.

A second class of pilots, quickly authorized by the Navy Department, complete ground training in September, after which it is contemplated to enroll twenty-five men every fortnight, keeping one hundred students under continuous progressive instruction, so that twenty-five graduate every two weeks as well. This scheme, providing for a highly concentrative two months' training in the preliminaries, is believed to be about the peak of velocity in developing navy birdmen.

To those familiar with the ground work for the Naval Reserve Flying Corps an analysis of the separate studies would unfold nothing new. There is the usual prescribed schooling in the four major subjects—navigation, rigging, motors, gunnery. The planes, which are torn down and reassembled by the students as fast a a youngster builds castles with his stone blocks, are a Burgess-Dunne, a Sturtevant, and the two Curtiss types, J-N-4 and J-N-3. The engines are a Curtiss O. X. ninety, a Sturtevant 145, a Gnome hundred, and a Hall-Scott hundred. An adequate supply of Lewis and Colt machine guns takes care of the gunnery classes, and Colt automatics and Springfield rifles supplement with target practice. With the best features of the original Dunwoody electrical and radio courses as a foundation the work in signalling, complete with blinker, semaphore and wigwag equipment supplied by the Government, is unusually thorough.

Seamanship as given student officers at Dunwoody, however, presents some novel points. A lake about a mile and a half square is the medium of imparting fundamentals concerning boats and water manoeuvres. This branch of the curriculum is in charge of chief petty officers—boatswain's mates and gunner's mates—who were old in the service when our little controversy with Spain was in bloom. They know all species of boats, guns and water, and an inland lake gives ample opportunity to teach the rudiments.

War canoes, motorboats and ten-oared navy cutters are employed to train the pilots in handling small craft—gangway, dock landings, coming alongside, hoisting, lowering, sea anchors and parts, lead line, knots and splices. Each cutter mounts a Lewis gun, and is fitted with fore and main sails. Daily after indoor training hours at school the fledglings march to the lake, to row, sail, race motorboats, or swim. A swimming instructor is on duty at the lake, and it is his job

In the carpenter shop the men learn to make each part of the woodwork necessary for aircraft, how to dope the fabric, and how to build pontoons

On Saturday morning the student officers don their dress uniforms and make ready for inspection by the Commandant at their barracks. Meantime, in a corner of their armory, they have an opportunity for some extra study of the workings of the Lewis gun

to see that every student proves himself at home in the water.

But the seamanship instruction does not end here. Every night after mess, at barracks in the aero club, the chief petty officers who drill the tyro pilots at the lake give lectures and blackboard talks on such subjects as lighthouses, buoys and beacons for American and European coasts, code flags, storm signals, lights on ships and seaplanes at anchor, tide tables, recognition of ships of various nations, with models and silhouettes.

Naval indoctrination is also taught at this hour, so that the men learn something of ship organization, honors, and the value of initiative.

A course in photography embodies map making from photographs taken in flight, with rectification and the scale equalizer considered. The men are taught how to prepare aero cameras for flight, also the formula for calculating the area obtained in pictures. Every student must know, too, the photographic processes for developing and printing.

In a short course on aerial observation, map reading, communication codes (to artillery), the zone call system, pre-arranged shots, and the use of the aeroplane aerial are studied. Enough astronomy is given so that the flying aspirants understand the apparent movement of the heavens, polaris, and the distinction, for example, between the Pleiades and Cassiopeia.

The daily routine for these student officers, once started at quarter of six in the morning, never lets up until ten at night. Not a moment in the interim is unocupied. The aero club, where the men both mess and lodge, seems like a merry enough clubhouse, or fraternity house, if you happen to step in about three minutes before the nonday meal. Then you may hear a couple of banjos, a raggy piano, and something more or less vocal. At any other hour the place is as quiet as an actors' club at breakfast time. The future aces are either at Dunwoody, at the lake, or studying in small groups within their rooms, or in the basement armory taking down a lecture. No liberty is granted except on Saturday afternoon and Sunday, and a man delinquent in any of his work is restricted even then.

Whenever Commander Warren J. Terhune, U.S.N., commandant of all U. S. Naval Training Schols in Mineapolis, issues a call for new aviation recruits it is surprising how many of the applicants are found to be under the minimum age of 20 years. They come in dozens, aged nineteen, or nineteen and a half, some of them younger than that.

"What's the difference?" they protest. "We'll be twenty by the time we get through training, won't we?"

It is difficult to refuse these spirited youths, for they are usually splendid physically, and they have the education. It is futile to ask them to "come back in six months." They join some other branch. Still, it is hoped that some of them will reappear for the autumn class.

With the American Army in France

The Americans in the fighting line north of Soissons had a quiet day on September 3.

There was considerable aerial activity in the Vesle region and several combats in the air. One German machine is reported to have been downed by Allied airmen.

American airmen successfully bombed Longuyon twice on September 3.

About thirty aeroplanes flew over the German lines and dropped a few bombs.

Pershing Praises American Flyers

With the American Army in France.—General Pershing has sent a letter to the Chief of the Air Service, commending the First Pursuit Group. The letter says:

The Commander in Chief has learned with great satisfaction of the work of the First Pursuit Group of the Air Service and desires to commend it especially for its praiseworthy record.

The handicaps under which this unit of the American expeditionary forces has been organized and begun the discharge of its duty are well known and recognized. With fine spirit and determination it has overcome obstacles and already achieved an enviable record. Its commander and personnel are congratulated for their effective and daring work.

9 American Aces Are Now in France

Paris.—American aviators are playing a large role in Allied aerial actions. Fighting German aviators, bombing troops, depots and aerodromes during the day and bombing the centres of enemy activity behind his lines at night, all form part of the work undertaken by the young American pilots. Their air victories are numerous and they are showing themselves to be excellent pupils of the French flying aces.

Among the American aces is Lieutenant Tobin, who, since July 11, has gone from success to success. On that day Tobin, who had been at the front only a few days, spotted an enemy machine making for the American lines. He immediately attacked and shot his adversary down in flames.

Five days later he brought down his second victim in the same circumstances. On August 1 he added another German flier to his bag and yet another on August 10. A day later he accounted for his fifth German. So Tobin became an ace.

To date the American aviation aces are Lieutenant Putnam, with twelve victories officially counted; Captain David Peterson, with six; Major Thaw, Sergeant Major Parsons, Lieutenant Douglas Campbell, Lieutenant Meissner, Lieutenant Rickenbacher, Lieutenant Tobin, five each. Lieutenant Porter has shot down four.

All these fliers operate scouting or fighting machines, while there are many others, of whom very little is heard, who fly heavy bombing machines which are in the air just as often, if not oftener, than the scouting machines.

Italian Army Headquarters.—One of the first exploits of the American hydroaeroplane pilots trained in Italy was that of J. H. Hammond of Baltimore, who saved Lieutenant Ludlow during a raid on the Austrian naval base at Pola. While Ludlow was dropping bombs his machine was riddled by the Austrian fire, and he was compelled to alight on the Adriatic three miles from Pola. When Hammond saw his plight he swooped to Ludlow's rescue, braving the concentrated Austrian fire and the attacks of five enemy aeroplanes.

Hammond hit the water near Ludlow's machine, ran alongside, took Ludlow aboard and stowed him under the motor of his one-seater plane. He then set Ludlow's machine afire.

Meanwhile the enemy aviators were keeping up a steady fire. Hammond with his own gun kept the Austrians off and got away safely, although pursued halfway across the Adriatic. Finally his machine gave out while near the Italian coast and the two Americans were forced to swim ashore.

Recruiting Stopped

The following statement is authorized by the War Department:

General March, Chief of Staff, has directed the discontinuance of voluntary enlistments for the Army, except as authorized by act of Congress in certain cases.

General Harris, the acting Adjutant-General, has issued instructions by telegraph to all recruiting officers in charge of recruiting districts to close up the recruiting stations as soon as practicable, in accordance with detailed instructions previously sent by mail. The enlisted men at the recruiting stations are to be sent to the nearest recruit depot, where they are to be physically examined and their qualification records made out, with a view to their assignment to appropriate duty. The six recruit depots, namely, Fort Slocum, New York; Columbus Barracks, Ohio; Fort Thomas, Kentucky; Jefferson Barracks, Missouri; Fort Logan, Colorado, and Fort McDowell, California, are to be utilized during the continuance of the war as mobilization places for selective service men, whence these men will be distributed to organizations.

The only original voluntary enlistments hereafter authorized will be of men over forty-six years of age and under fifty-six years. The enlistment of these men is authorized only for Staff Corps and Departments. There are few applications for enlistment from among this class of men and the enlistment of such as are found qualified can be effected at the mobilization depots enumerated above, or any one of the military posts or encampments throughout the country.

SOME METEOROLOGICAL CONDITIONS WHICH INCREASE THE DANGER OF FLYING*

By Captain C. J. P. CAVE, R.E.

Introduction

IT may seem rather presumptuous for one who does not himself fly to discuss the dangers that may be met with in the air as though a landsman who had crossed the Channel a few times were to write on the navigation of a ship across the ocean. At the same time, it may be of some use to point out certain conditions of the atmosphere which seem to me to constitute dangers, although I may be mistaken in my estimate of some of these, and would welcome any information from pilots bearing on the subject. In fact, my paper is meant to elicit information rather than to give it.

At the same time I should like to protest very strongly against the idea that we have made so much progress in the science and art of aviation that we can afford to disregard the weather altogether, except perhaps in the case of fog. The idea is a common one, and has been often stated, but it seems to me that it is a most dangerous idea to foster. An airman cannot afford to disregard the weather any more than can a seaman. A seaman puts to sea in almost any weather, but the fact that storms take their toll of shipping is a proof that seamen cannot entirely disregard these things. Neither are airmen immune. Only last summer it was stated in our official *communique* that five of our aeroplanes had failed to return owing to a severe rainstorm.

Probably what is meant when it is stated that airmen can afford to disregard the weather is that somuch progress has been made in the construction and design of aeroplanes that they can go up in almost any wind and can fly safely in winds that would have proved fatal to machines in a few years. But there remain some conditions that are dangerous, and many that are severe hindrances to aeroplane work in war.

The chief conditions that suggest themselves to my mind as increasing the risks of flying are the following:—(1) Gales; (2) squalls; (3) bumps and eddies; (4) clouds; (5) rain, hail and snow; (6) fog; (7) lightning. It is possible that the number might be added to by experienced pilots, and it is also possible that some of the conditions that seem to me to be dangers may not really be such, but I suggest them in the hope of getting more information.

*Paper read before the Aeronautical Society of Great Britain.

Gales

In the early days of flying strong winds were more formidable than to-day, but there are still occasions when the wind is so strong that machines are able to make little or no headway against it, and such a strong gale may arise with great suddeness and sometimes without much warning.

An example occurred on December 28, 1914, when a small depression formed over the Bristol Channel and passed across the south of England, causing a gale that did a considerable amount of damage. In the south-east of England it was nearly calm before the onset of the gale, which sprang up with great suddenness. At Farnborough, for instance, an anemomter exposed 140 feet above the ground level registered a velocity of 80 miles per hour, when only a quarter of an hour previously it had been quite calm. I do not know that there were any aeroplanes flying when the gale began; probably not. The gale began in the afternoon in the southwest of England, but it did not reach the southeastern counties nor the northeast of France till after dark. But a gale of 80 miles per hour 140 feet above the ground must have been considerably more at a height of 1,500 feet, and I venture to think that if aeroplanes were flying when such a wind sprang up many would have failed to return to their aerodromes. If at the same time there were a development of low clouds when such a gale came on aeroplanes would be likely to lose their bearings entirely.

Besides the loss of aeroplanes actually flying, a gale such as the one under discussion would cause severe damage to hangars and tents, and I believe that on this occasion considerable damage was caused in this way.

Gales may spring up with great suddenness at all times of the year; in fact, I think that a summer gale may often give less warning of its approach than a winter one. Anyone who has done any sailing round our coasts must remember cases where they have been caught in gales a couple of hours or so after having been lying becalmed. I think that easterly gales in the summer are apt to spring up suddenly in this way.

A gale, however, usually gives warning of its approach, and may often be forecasted many hours in advance, and the weather map for the day will usually indicate when a gale is likely.

Squalls

A squall is a temporary rise in wind above the mean velocity that preceds and follows it, the rise in velocity being continued over some minutes at least, and is thus distinguished from a gust, which only lasts a small part of a minute. Squalls are of innumerable degrees of severity. On a day of blustery northwest winds, when there are large cumulus clouds about, one may have a succession of squalls, whose approach can be seen at sea some time before the onset. Such squalls are probably not of any particular danger to aeroplanes, as at sea they are not of much danger to shipping, except in the case of small open sailing boats, but in peace time at seaside resorts they take their toll of holiday makers who are sailing with the main sheet made fast.

More intense squalls are associated with thunderstorms, and they are all the more dangerous since they are often preceded by very light winds or even by a complete calm, and within a minute or so from their onset the wind is blowing at the rate of even 60 to 80 miles per hour. A typical example of such a squall occurred on August 2, 1906. As seen in the east of Hampshire, this storm came up from the direction of the Isle of Wight in the shape of a huge cumulus cloud with a great extension of false cirrus at the top, giving it the appearance of a giant mushroom; the day had been very hot and the air was very still. As the storm approached it was seen that heavy rain was falling, but there was no sign of wind to the untrained eye. A few minutes before the rain reached the observer a continuous roar was heard, and as the first drops fell a furious blast of wind arose; the wind only lasted a few minutes, and in three-quarters of an hour the storm has passed and the weather was fine again. The storm passed over the South Downs, and the same storm or another moving parallel to it reached Guildford, where the damage done by the wind was very great. An airship would have been in the very greatest danger and could hardly have weathered the storm.

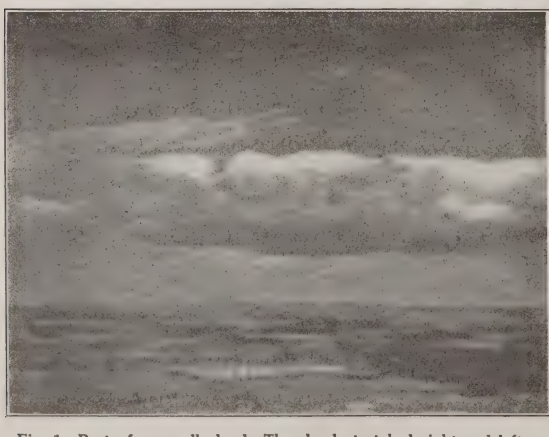

Fig. 1. Part of a squall cloud. The cloud stretched right and left as far as could be seen. When it came overhead there was a moderate squall with snow

Fig. 2. Very small cumulus clouds beginning to form

The squall in front of an ordinary thunderstorm is probably a modification of another variety known as the line squall. The sequence of events in a line squall is somewhat as follows: A bank of clouds is seen extending along the horizon, the upper parts being white and in shape like ordinary cumulus, though the whole cloud usually appears of a more uniform height, and not broken up into such distinct peaks as is ordinary cumulus. (Fig. 1.) As the cloud approaches it is seen to be extremely dark below, and it usually extends in a long line, stretching from horizon to horizon, but owing to the effect of perspective it appears like an arch in the sky, the summit of the arch coming nearer and nearer overhead. As the cloud reaches the observer a violent squall springs up, the wind veers rapidly or even suddenly, rain falls in torrents and is often accompanied by hail, and there may be thunder and lighting; at the same time the temperature falls considerably, a fall of five or ten degrees being common, and it is sometimes as much as 20 degrees. When the cloud is approaching and is nearly overhead a curious sinuous line is seen at its base extending right along the front of the cloud, and it is this line which gives the name of line squall to the disturbance. After the first blast the wind blows strongly for a time and the heavy rain lasts for half an hour, more or less; this is followed by a less intense fall of rain and by decreasing wind, and after an hour or so the weather often clears up and becomes fine.

A line squall is only a few miles across, but it may be several hundred miles long, and it advances across the country broadside on at the rate of 20 to 40 miles per hour; one such squall has been traced from Cape Wrath to the centre of France, another from the northwest of Ireland to the centre of Germany. The list of disasters caused by line squalls is a long one; the best known case is that of H.M.S. *Eurydice*, a training ship homeward bound, that was struck by such a squall when off the Isle of Wight on March 34, 1878, and foundered with heavy loss of life.

Besides the blast of wind in front of the squall, there are great up currents in front and down currents near the middle of the squall, with much eddy motion between them. Such conditions could hardly fail to be dangerous, and, though an aeroplane might possibly come safely through them, it is hardly likely that an airship would.

The onset of a line squall is generally sudden, though anyone with a very little training in meteorology can see it coming while it is still some way off. On January 20, 1916, a line squall passed across the country from northwest to southeast, reaching Farnborough at 10:30 A. M. The morning had been fine, and a number of machines were out on the Common; the squall came on suddenly, and several machines were damaged before they could be got back into their sheds. A storm such as this one can be predicted with some success if the machinery is ready for the purpose. The general conditions favorable for line squalls can usually be forecasted from the Daily Weather Map prepared at the Meteorological Office, but unless a line squall occurred at one of the Meteorological Office observing stations at the time of the taking of the meteorological observations or shortly before, the existence of the squall may not be noticed on the map. The squall of January 20, 1916, which was not particularly severe, was first observed in the south of Ireland at about 4:30 A. M. It was accompanied by much thunder and lightning. It crossed the Irish Sea and reached the coasts of Cornwall and Wales at about 7:30 A. M., and moved across the country in a line 100 miles long or so, the movement being, as usual, at right angles to its length. Now this storm did not affect any of the Meteorological Office observing stations, and hence its existence was not known officially, as one may express it But, since a squall of this type is perfectly easily recognized, its coming might have been foretold if the proper machinery had been in existence to deal with it; such a warning might have been received in plenty of time for the aeroplanes on the Common at Farnborough to have been put in their sheds in safety.

That there is time for such warnings to be given is shown by the fact that recently I had a telegram from Upavon telling me that a line squall had just passed over; the telegram was received about ten minutes before the squall, which was not at all a severe one, reached Farnborough. Ten minutes is doubtless too short a time for the warning to be acted upon, but a station further west than Upavon could have sent a warning that would have been received in plenty of time.

It appears to me that it would be quite feasible for an observer at every aerodrome to send a telegram to some central office when a line squall took place; at the central office the general weather conditions would be well known, and therefore the direction of motion of the squall could be foretold. In addition, other reports would come in as the squall reached other aerodromes, and the rate of travel could be obtained with some accuracy. Warning could then be sent to all aerodromes which were likely to be affected, and some signal might be hoisted in a conspicuous place where it could be seen not only by those who were responsible for machines on the ground, but also by pilots who were flying in the immediate neighborhood of the aerodrome. Some such organization would not be complicated, and would only occasionally have to be put into use, but it might be the means of saving machines, and possibly lives also. If the information were to be sent out by wireless the warnings would be received still earlier. But weather forecasts are looked on in some quarters as the subjects for jokes, and it will take some serious accident caused by line squalls before anything practical is likely to be done. A severe line squall is generally accompanied by lightning and thunder, and an automatic lightning recorder would indicate its approach, especially in winter, when thunderstorms are almost entirely of the line squall type. The lightning recorder at Farnborough began to record lightning at about 5 A. M., on January 20, 1916, and it was quite evident from the chart that something quite out of the ordinary, for the winter, was occurring.

Bumps and Eddies

I do not propose to deal with these at any length. The danger from bumps is small with modern aeroplanes, though in the early days of flying they were a great source of danger. Pilots are far better qualified to speak of bumps than is a meteorologist who has only been taken in the air a few times as a passenger. Bumps are mostly due to rising currents of air over surfaces of the ground that are at different temperatures and to eddy motion due to the wind blowing over irregularities of the surface. They also seem to occur at the cloud layer when there is a sheet of cloud, and they occur, of course, with cumulus clouds.

In this connection there is a point on which pilots could give some information. At Farnborough an easterly wind is far more bumpy than a westerly wind. Is this due to some local configuration of the ground, or is it something inherent in an easterly wind? I suspect that there is some connection between bumpiness and easterly winds, but what it is I cannot attempt to explain. An easterly wind has, seemingly, peculiarities of its own; it is said, for instance, that there is always more sea in the Channel with an easterly wind than with a wind of corresponding strength from other quarters.

Clouds

Clouds may be a danger in several ways. In the case of cumulo nimbus clouds the heavy rain, and possibly hail, or the snow in winter, may prove extremely dangerous. Such clouds, too, are often of great extent, and are the sea of very rapidly ascending currents of air. A pilot might have to fly a considerable distance before getting clear, and might easily lose his bearings. A cumulo nimbus cloud is one that should be avoided if it is possible to do so, and, as these clouds often occur in isolated masses, it may be at times possible to fly around them. A cumulo nimbus, the true shower cloud, from which rain, hail or snow is falling, may be distinguished from simple cumulus by the fact that the top of the former cloud, instead of being rounded and hard-edged, is brushed out into a soft-looking mass of fibrous cloud called false cirrus. It is true that showers fall from simple cumulus clouds, but the really heavy falls are from cumulo nimbus.

Cumulus clouds are more common in summer than in winter. They usually begin to form in the morning as the day gets warm, and reach their greatest development about two or three in the afternoon, after which they generally begin to disappear, and by sunset or soon after the sky may be quite clear even after a day of great development of this form of cloud. But they may be met with at other times, and they form after sunset in the summer when shallow depressions, bringing thunderstorms, are approaching.

Low sheets of clouds may prove a hindrance to work with aeroplanes, and if they are very low they may cause difficulties for a pilot in finding his way back to the aerodrome, or even difficulties in landing at all. The possibility of low sheets of cloud forming after a clear morning, especially in winter during unsettled weather, should always be borne in mind. A glance at the latest weather map will often be a valuable guide as to whether a fine morning is likely to last. Take, for instance, map for 7 A.M., on December 24 last. This shows that the sky was clear in northeastern France, but subsequent reports show that it became overcast and rainy, and that there was a great extension of low cloud. Anyone who had in the least followed the weather on the days preceding this date and who had seen the map for the day, or even for the preceding evening, would have realized that the fine morning was not likely to last beyond a very short time. I maintain that aeroplanes going up on such a morning would have been extremely likely to find low clouds extending to within a few hundred feet of the ground before their return, and they would therefore be in some danger. It might be that it would be necessary to incur the danger, that it was worth incurring the danger for the results that might be obtained, but it would be absurd to say that such meteorological conditions would not add to the risks of flying.

(To be concluded)

Cleveland-Chicago and return aerial mail flights. This map is described on page 1310

Key to Abbreviations

AAD—Assigned to active duty.
ADO—Report to Aviation Supply Depot, Dayton, Ohio.
ADT—Report to Aviation Supply Depot, Dallas, Texas.
AFO—Report to Aviation Supply Depot, Fairfield, O.
AGC—Report to Aviation Supply Depot, Garden City, L. I., N. Y.
AHT—Report to Aerial Gunnery School, Houston, Texas.
AIR—Transferred to the Air Service, National Army, without change in rank or date of commission.
ALF—Report to Camp Alfred Vail, Little Silver, N. J.
AMV—Report to Aviation General Supply Depot, Morrison, Va.
AOV—Report to School for Aerial Observers, Hampton, Va.
APR—Report to School of Aerial Photography, Rochester, N. Y.
ARV—Report to Aviation Supply Depot, Richmond, Va.
ASM—Report to Aviation Mechanics' Training School, St. Paul, Minn.
BFT—Report to Barron Field, Fort Worth, Texas.
BRN—Report to Bakers Field, Rochester, N. Y.
BST—Report to Brooks Field, San Antonio, Tex.
CAF—Report to Carlstrom Field, Arcadia, Fla.
CAP—Commissioned as Captain, Aviation Section, Signal Corps.
CDT—Report to Aviation Concentration Camp, Dallas, Texas.
CFT—Report to Carruthers Field, Fort Worth, Texas.
CGC—Report to Aviation Concentration Camp, Garden City, L. I., N. Y.
CGS—Report to Aviation Concentration Camp, Greenville, S. C.
CIT—Report to Radio School, Carnegie Institute of Technology, Pittsburgh, Pa.
CJS—Report to Camp Jackson, Columbia, S. C.
CJW—Report to Camp John Wise, San Antonio, Texas.
CLR—Commissioned as Colonel, Aviation Section, Signal Reserve Corps.
CMV—Report to Aviation Concentration Camp, Morrison, Va.
CPA—Commissioned as Captain Air Service, National Army.
CPR—Commissioned as Captain, Aviation Section, Signal Reserve Corps.
CRI—Report to Chanute Field, Rantoul, Ill.
CSO—Report to the Chief Signal Officer, Washington, D. C.
CUI—Report to School of Military Aeronautics, Cornell University, Ithaca, N. Y.
CWT—Report to Call Field, Wichita Falls, Texas
DAF—Report to Dorr Field, Arcadia, Fla.
DAP—Report to Director of Aircraft Production, Washington, D. C.
DIK—Report to Camp Dick, Dallas, Tex.
DIS—Honorably discharged from service.
DMA—Report to Director of MilitaryAeronautics, Washington, D. C.
ELA—Report to Eberts Field, Loanoke, Ark.
EOT—Report to Ellington Field, Olcott, Texas.
FLA—Commissioned as First Lieutenant Air Service, National Army.
FLR—Commissioned as First Lieutenant, Aviation Section, Signal Reserve Corps.
FLT—Commissioned as First Lieutenant, Aviation Section, Signal Corps.
FOB—Report to Fort Omaha Balloon School, Omaha, Neb.
FRF—On duty requiring regular and frequent aerial flights.
FSO—Report to Fort Sill School for Aerial Observers, Fort Sill, Okla.
GIT—Report to School of Military Aeronautics, Georgia Institute of Technology, Augusta, Ga.
GLC—Report to Gerstner Field, Lake Charles, La.
HHN—Report to Hazelhurst Field, Mineola, L. I., N. Y.
JMA—Rated as Junior Military Aviator.
JRC—Report to Jackson Field, Riverside, Cal.
KST—Report to Kelly Field, So. San Antonio, Tex. (When specified in the order, the number of the field is given in parentheses)
LDT—Report to Love Field, Dallas, Tex.
LHV—Report to Langley Field, Hampton, Va.
MAC—Report to March Field, Allesandro, Cal.
MAJ—Commissioned as Major, Aviation Section, Signal Corps.
MAT—Report to Mather Field, Sacramento, Cal.
MDO—Report to McCook Field, Dayton, Ohio.
MIT—Report to School of Military Aeronautics, Massachusetts Institute of Technology, Boston, Mass.
MJA—Commissioned as Major Air Service, National Army.
MJR—Commissioned as Major, Aviation Section, Signal Reserve Corps.
MSC—Report to Radio School, Maryland State Agricultural College, College Park, Md.
OBS—Attached to the Aeronautical Service as Observers.
OSU—Report to School of Military Aeronautics, Ohio State University, Columbus, Ohio.
PFO—Report to Post Field, Fort Sill, Okla.
PMT—Report to Park Field, Millington, Tenn.
PUP—Report to School of Military Aeronautics, Princeton University, Princeton, N. J.
PWM—Report to Payne Field, West Point, Miss.
REL—Relieved from present duty.
RSD—Report to Rockwell Field, San Diego, Cal.
RTR—Retransferred to organization attached to previous assignment to aviation duty.
RWT—Report to Rich Field, Waco, Tex.
SBI—Report to Scott Field, Belleville, Ill.
SAG—Report to Souther Field, Americus, Ga.
SGS—Report to Camp Sevier, Greenville, S. C.
SLA—Commissioned as Second Lieutenant Air Service, National Army.
SLR—Commissioned as Second Lieutenant, Aviation Section, Signal Reserve Corps.
SLT—Commissioned as Second Lieutenant, Aviation Section, Signal Corps.
SMM—Report to Selfridge Field, Mount Clemens, Mich.
SRC—Report to Columbia School for Radio Officers, New York City.
TFT—Report to Taliaferro Field, Fort Worth, Texas. (When specified in the order, the number of the field is given in parentheses)
TMA—Report to Taylor Field, Montgomery, Ala.
UCB—Report to School of Military Aeronautics, University of California, Berkeley, Cal.
UIU—Report to School of Military Aeronautics, University of Illinois, Urbana, Ill.
UTA—Report to School of Military Aeronautics, University of Texas, Austin, Tex.
VBW—Report to Vancouver Barracks, Washington.
WAC—Report to Aviation Concentration Camp, Waco, Tex.
WCS—Wire to the Chief Signal Officer upon arrival.
WDM—Wire, Director of Military Aeronautics, upon arrival.
WFO—Report to Wilbur Wright Field, Fairfield, Ohio.

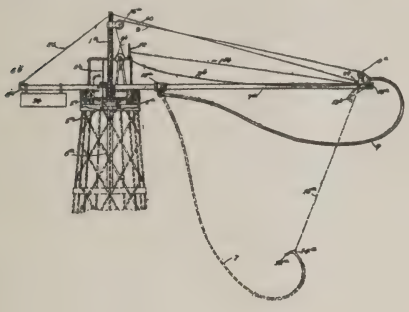
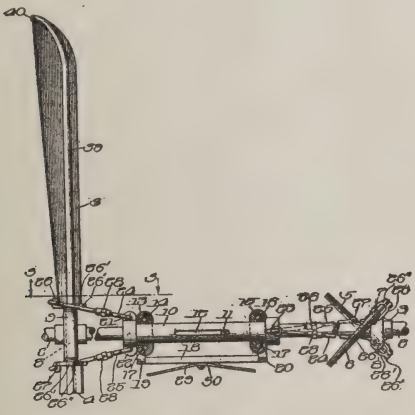
(*Continued on page* 1334)



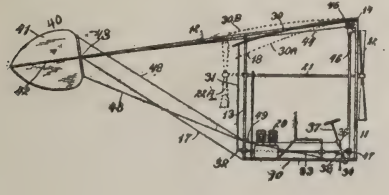
When an aeroplane squadron moves. The photographs show the chosen location of an aeroplane squadron for its new aerodrome. A number of mechanics arrive at the place chosen in motor trucks and from then on the place is a scene of tireless activity. One of the first things done is to erect the hangars for the planes. These are sometimes made of steel and sometimes of wood, but no matter of what kind of material they are made to be put together in a hurry. The material arrives in pieces, fitted, and all that remains to be done is to erect and put those pieces together. The wooden skeleton is covered with heavy tarpaulins which are heavily camouflaged according to their surroundings. In the right photograph may be seen the rolled tarpaulins and in the left photograph a hangar nearly ready for the tarpaulin covering. In the distance may be seen the aeroplanes waiting for their home to be completed. The whole move can be completed in less than a day.

RECENT AERO PATENTS



BY WILLIAM N. MOORE

1,144,505. AERIAL LANDING AND LAUNCHING APPLIANCE. FRANK STEFFAN, San Diego, Cal. Filed Feb. 18, 1914. Serial No. 819,402. (Cl. 244—2.)

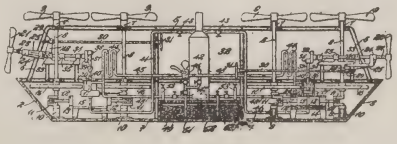


1. In a device of the class described the combination of a rigidly mounted base, a member revolubly mounted in said base, a horizontal member rigidly secured to said revolubly mounted member, a curved arm pivotally and revolubly mounted at its one end on said horizontal member and means for raising and lowering one end of said curved arm.

1,144,521. AERIAL PROPELLER. WILBER S. BARROWS and ASAHEL H. BARROWS, Chicago, Ill. Filed Mar. 24, 1913. Serial No. 756,304. (Cl. 170—163.)

1. The combination with a propeller shaft, of a pair of propellers, a hub on said shaft into which blades are swiveled, a member slidably mounted on said shaft and stationary relative to said shaft's rotary movement, levers upon said blades, connections between said levers and said member, means for varying the lengths of said connections, and means for varying the length of throw of said levers.

1,145,972. AEROPLANE. HARRY B. CHALMERS, Dedham, Mass. Filed Aug. 3, 1910. Serial No. 575,218. (Cl. 244—29.)



1. In an aeroplane, a frame therefor comprising a transverse spar in the front thereof and a longitudinal spar running rearwardly therefrom, a pair of supporting wings projecting rearwardly from the transverse spar at either side of the longitudinal spar, a control shaft, a supporting shaft upon which said control shaft is mounted, and connections between said supporting shaft and the wings whereby the positions of said wings may be simultaneously adjusted in opposite directions by moving the control shaft sidewise.

2. In an aeroplane, a frame therefor comprising a transverse spar in the front thereof and a longitudinal spar running rearwardly therefrom, a pair of supporting wings projecting rearwardly from the transverse spar at either side of the longitudinal spar, a horizontal rudder mounted upon the rear end of the longitudinal spar, a control shaft, a supporting shaft upon which said control shaft is mounted, connections between said supporting shaft and the wings whereby the positions of said wings may be simultaneously adjusted in opposite directions by swinging said control shaft as a whole sidewise and other connections between the control shaft and the horizontal rudder whereby the rudder may be moved up and down by swinging the control shaft forward and backward.

3. In an aeroplane, a frame therefor comprising a transverse spar in the front thereof and a longitudinal spar running rearwardly therefrom, a pair of supporting wings projecting rearwardly from the transverse spar at either side of the longitudinal spar, a rudder mounted upon the rear end of the longitudinal spar, a control shaft, a supporting shaft, a tilting member on the end thereof in which the control shaft is mounted, connections between said supporting shaft and the wings whereby the positions of said wings may be simultaneously adjusted in opposite directions by moving said control shaft sidewise, and other connections between the tilting member and the rudder whereby the rudder may be tilted by moving the control shaft back and forth.

1,149,218. AEROSTAT. JOHN COOPER PORTER, Northampton, Mass. Filed Sept. 3, 1913. Serial No. 787,860. (Cl. 244—19.)

1. An aerostat comprising a hull adapted to float on the water, a pair of elevating propellers mounted at the upper ends of parallel vertical shafts, provided with cranks near the lower ends, a horizontal fluid pressure cylinder mounted in said hull between said shafts, said cylinder having two oppositely facing pistons arranged therein, and driving rods attached to said pistons and connected to the cranks of said shafts to rotate the latter.

2. An aerostat comprising steering and propelling means, a pair of gyroscope wheels mounted on parallel vertical shafts for rotation in horizontal planes, elevating propellers mounted at the upper ends of said shafts, the lower ends of said shafts being cranked, and a horizontal fluid pressure cylinder mounted between the lower ends of said shafts, said cylinder having two oppositely facing pistons arranged therein and operatively connected to said cranks to rotate said gyroscopes and propellers.

3. An aerostat comprising and propelling means, a pair of parallel vertical crank shafts having gyroscope wheels fixed thereon and adapted to rotate in the same horizontal plane, elevating propellers mounted at the upper ends of said shafts, and a horizontal fluid pressure cylinder mounted between said shafts, said cylinder having two oppositely facing pistons arranged therein and connected to the cranks of said shafts to rotate the latter.

4. An aerostat comprising a hull adapted to float on the water, a framework erected upon said hull and supporting parallel vertical crank shafts, a plurality of pairs of elevating propellers mounted at the upper ends of said shafts, and a horizontal fluid pressure cylinder mounted between the shafts of each of said pairs of shafts, each of said cylinders having two oppositely facing pistons arranged therein and connected to the cranks of said shafts, respectively, to rotate the latter, and a third cylinder operating in synchronism with said horizontal cylinders, said last named cylinder containing a double acting piston for rotating a horizontal propeller shaft unprovided with a gyroscope wheel.

5. In an aerostat, in combination with a hull, one or more pairs of elevating propellers, driven by vertical shafts having step bearings in said hull, each shaft carrying a gyroscope, and being operated by fluid pressure upon one of two oppositely facing pistons in a single cylinder.

FOREIGN NEWS

AUSTRIAN

The War Office statement of August 30 says:

Yesterday our aeroplanes dropped fifty bombs on Monte Belluno Station.

BRITISH

During the last week no fewer than seventeen separate raids into German territory have been carried out by the allied independent air force, which is under the command of a British general.

While extensive damage is known to have been done to important military objectives, such as the railway junction at Treves, the station at Frankfort, and the chemical factory at Saaralben, the most striking feature of the week's work was the raid on the Mannheim poison gas factories, where British airmen, flying at a height of 200 feet, narrowly avoided collision with the factory chimneys.

Although this manœuvre necessarily increased the personal risk of the airmen, it enabled them to direct their bombs with great accuracy toward the more vulnerable parts of their objective. Every bomb released was seen to hit its target.

The drastic moral effect produced by the bombing aeroplanes flying at the housetop levels may easily be imagined, and the German defense tactics were for the time paralyzed by the totally unexpected and, indeed, unprecedented nature of the attack, as is shown by the fact that all the British machines returned safely.

In the northern coastal region, Bruges has been bombed nine times, and successful raids have been made upon military works at such places as Zeebrugge and Ostend.

The almost monotonous frequency with which these names appear in the official communiques tends to blunt the imagination of the public to the real magnitude and significance of the effort which Great Britain is making against this formidable sector of the western front. Scarcely a day passes without at least one raid upon these vital German strongholds. Sometimes three or four raids are made in a single day. Often a squadron attacking one of the objectives, say, at 11 o'clock in the morning, will be relieved by another squadron, say, at noon, which will carry on until relieved by a third squadron, and this over one of the most strongly fortified military positions in Europe and against defensive organizations of the most formidable kind.

Although figures can convey only the slightest notion of the intensive character of the British aerial attacks upon these coastal fortresses, it may be noted that during the last three months the following raids have been made: Upon the German works at Zeebrugge, 72; at Bruges, 63; at Ostend, 64. In addition to these 199 raids, an immense number of separate attacks have been delivered upon other military works in the coastal area.

While German Headquarters reports continue to make claims of German successes in the air fighting on the western front, the official tally made on the British side for the last week shows 74 enemy machines destroyed and 34 driven down out of control, while 32 British machines are reported missing.

An official statement issued by the Air Ministry on bombing and raiding operations says:

The morning of August 30 our machines attacked the railway station at Conflans and a hostile aerodrome. Direct hits were made both on the hangars at the aerodrome and the railway at Conflans. In the course of fighting one enemy aeroplane was destroyed. All our machines returned safely.

Another attack was also carried out by one of our squadrons on the stations at Conflans and Thionville. This squadron engaged a largely superior number of hostile machines. Fierce fighting ensued, in the course of which one enemy aeroplane was destroyed and one sent down out of control. Four of our machines are missing.

Eleven hostile machines were shot down by us on August 29 and ten were driven down out of control. One German balloon was set on fire. Nine of our machines are missing. Our airmen were actively engaged in all departments of their work throughout the day.

Fifteen and a half tons of bombs were dropped on a variety of targets, including the Bruges Docks and many railway connections beyond the battle zone. Unfavorable weather prevented night flying.

Fifteen German aeroplanes were destroyed and five others brought down on August 30th in aerial fighting by the British and French forces, according to the statements of the War Offices. The British destroyed twelve German machines and put five others out of control, and the French put three craft of the enemy out of commission.

The weather was cloudy on August 31 but the various activities of our air service were fully maintained all along the front. There was much useful observation by aeroplanes and balloons. Twelve enemy machines were destroyed during the day and five driven down out of control. Four of our machines are missing.

The Bruges docks and the Zeebrugge mole were heavily bombed, as well as a number of selected targets opposite the battle zone. In all, twenty-five and one-half tons of bombs were dropped during the twenty-four hours.

This information was received September 1 from the "Rhine front":

In the air raid in Cologne, August 21, the casualties were 45 killed and 176 wounded. In the last raid on Frankfort the railway station was badly damaged and twelve killed. In Cologne and elsewhere considerable damage has been done by the Germans' own shell fire.

A Turkish official communication received September 1 reports that an aeroplane was brought down in flames during a raid on Constantinople on August 28. It says the captain of the machine, a British officer, was wounded and made prisoner.

The operations of the British aviators in the fighting zone are described in an official communication on September 2 as follows:

After the heavy rain of August 31 the weather improved and our aeroplanes and balloons carried on their work in a clear atmosphere and high wind.

In spite of the opposition of enemy machines, over 1,000 photographs were taken by our aviators and many reconnoissances effected. Contact with our advancing troops was closely maintained.

Our observation balloons were constantly pushed forward, and these, with our artillery patrols, kept our batteries informed as to numerous targets, which were successfully engaged.

Throughout the day the area in which the Germans were entering was searched by our low-flying airmen, who everywhere attacked enemy troops and transports with bombs and machine gun fire, causing heavy casualties and much confusion. Bridges and railway connections were heavily bombed in the enemy back areas.

In the air fighting eight enemy machines were destroyed and four driven down out of control. Six hostile balloons were brought down in flames by our aeroplanes. Eight of our machines are missing.

On the following night bombing was continued both in the zone immediately behind the battle line and further east. A German aerodrome beyond St. Quentin was heavily attacked and direct hits were observed. We lost one night bombing machine.

During the twenty-four hours over thirty-four tons of bombs were launched on different targets.

In addition to the hostile machines already reported to have been accounted for on Friday last, our anti-aircraft fire brought down a German night bombing machine on that date.

Six hostile machines were destroyed in air fighting on August 31 and three driven down out of control. Seven of our machines are missing. In spite of low clouds the work of the British air forces along the front was carried on throughout the day in close co-operation with the troops on the ground by our aeroplanes and balloons. A large number of photographs were taken and enemy movements kept under observation. Twelve and one-half tons of bombs were dropped between dawn and dusk. At night flying was impossible.

FRANCE

The French official report of August 30 contains the following:

Our bombarding machines have attacked the Pinon forest and the railroad station at Anizy-le-Chateau (both between Soissons and Laon) and crossings of the Ailette located in this region. More than forty-eight tons of explosives were dropped.

Twenty enemy machines have been downed or sent down out of control. An enemy captive balloon was set on fire.

The French, the despatches say, brought down five enemies within the Allied lines, forty-seven German machines were seen to fall within their own lines and ninety-three others, if not destroyed, were badly damaged. On August 30, during the day, three enemy aeroplanes were brought down and two captive balloons were set on fire. During the night our aeroplanes were able to drop 3,150 kilos of projectiles on objectives in the region east of Conflans Station, Chambray, and Thiaucourt, and factories at Thionville.

The official communique of September 1 on aviation says:

"Eight enemy aeroplanes were brought down or fell in a damaged condition. From a low altitude our bombing aeroplanes to-day dropped twenty-three tons of projectiles on enemy concentrations and convoys in the region of Vauxaillon, Neuville-sur-Margival, Laffaux and Nanteuil-la-Fosse (all northeast of Soissons).

"Thousands of cartridges were fired in the same regions on enemy troops."

An official dispatch from Paris furnished an idea of the tremendous aerial activities conducted by the French Navy, principally in operations against submarines. It says:

"In June the aerial patrols of the French Navy covered 447,040 miles, 59,100 miles being by airships, which made 256 flights and 1,481 hours of navigation. Aeroplanes and seaplanes were in the air 5,758 hours and made 3,365 sorties. Captive naval balloons accomplished 66 patrolling errands and 114 scouting flights for dredges, amounting to a total of 4,408 hours of flight.

"In July the activity of the various aerial organizations of the French Navy was equally intense. Captive balloons were engaged 5,520 hours, airships 1,311 hours, and aeroplanes and seaplanes 7,432 hours. The naval aerial patrols in their flights covered 485,330 miles."

Enemy submarines were attacked fourteen times and numerous groups of mines were discovered.

GERMANY

Frontier correspondents of the *Telegraaf* assert that travellers from Germany report heavy damages from recent air raids in towns along the Rhine. Forty persons were killed in the last aerial attack on Cologne, and entire streets in Mannheim were laid in waste. At Bingen the aniline works were levelled.

On September 2 we shot down thirteen enemy balloons and fifty-five aeroplanes, thirty-six on the Arras battlefield. Twenty-six of these were brought down by the Chaser Squadron No. 3 under the leadership of First Lieutenant Lörzer, who achieved his thirty-fifth aerial victory.

On September 3 we shot down twenty-two aeroplanes and seven balloons. Lieutenant Rumey won his thirtieth aerial victory.

On September 4 we shot down thirty-two enemy aeroplanes.

ITALIAN

The official communication issued by the War Office on August 30 says: Two hostile aeroplanes have been brought down.

The official report issued September 1 upon aviation says:

"Yesterday morning our aeroplanes reached Franzensfeste (Tyrol) and, flying very low, dropped bombs with accuracy on the important railway establishment there.

(This is the junction of the railway from Trent with the line running down the Drave Valley. The planes had to go about seventy-five miles over high mountains.)

"Other bombarding operations were carried out during the day on the enemy's front lines and back areas by our own and Allied aviators.

"Last night army and navy airships bombarded the military works at Pola and the station and depots at Primolano. Seven hostile machines were brought down in air fighting."

A telegram to the Italian Embassy on Sept. 3 stated that during recent enemy raids on the Italian front the Austrians lost numerous machines and several of their best pilots. Eight of these had been mentioned in Austrian dispatches for special bravery.

The dispatch said that in August Lieutenants Oppocher and Schuffs were killed over Levico. Lieutenant Linke and Count Salm, belonging to the 13th Dragoons, also were killed in air encounters. Lieutenant Hebra, who had been decorated several times, was brought down after a fierce duel over Klagenfurt. Lieutenant Eprfeld also has been killed and Baron Kutchers has had both legs fractured.

A communique to the Belgian Legation stated that Lieutenant Willy Coppens of the Belgian Aviation Service had brought down in flames three balloons, achieving his twenty-sixth, twenty-seventh and twenty-eighth victories.

MODEL NEWS

Edited by John F. McMahon

Model Aeroplane Building as a Step to Aeronautical Engineering

THE metal for the tank should be at least five thousandths of an inch thick and no more than eight thousandths, or the tank will be too heavy.

The metal is wrapped around the mandrel, lapping the edges about ¼ of an inch, then held in place by wire and soldered where lapped. After soldering the metal should be slipped off the mandrel and the ends clipped off to make the cylinder the proper shape for soldering the caps in place.

Slip the metal back on the mandrel and wrap with very thin piano wire about ⅛″ apart. The wire should then be soldered along the dotted line before the caps are soldered in place.

The air "shut off" from the tank is made from a gas cock. The excess parts are filed away to lighten up as shown.

The bicycle valve is next soldered into the other cap, after which holes are drilled and a 1/16″ steel axle soldered in place as shown in the sketch at the right.

The tank should be tested for leaks by blowing up to about 40 pounds pressure and placing in a tub of water.

When sure that tank is O. K., solder the intake into the air cock as shown.

The general arrangement of the motor and tank assembly is shown at the right bottom of the cut.

The tank should be painted a dull black for effect.

The tank should be blown up by the use of a large foot pump, such as automobilists carry, to a pressure of about 150 pounds. The will take about one hundred strokes of an ordinary 1¼-inch diameter pump. A tire gauge will be needed to determine the proper pressure as it is dangerous to put more than 150 pounds in the tank. The engine should be run under pressure a few times to work it in, keeping it well oiled up. A small fly-wheel can be put in place of the propeller for this preliminary test.

The construction of the model is such as to provide a support for the motor and tank and also to hold the wings and landing chassis. The engine is fastened to the end of the frame members by the use of two strips of brass bent around the cylinders and fastened with thread and glue.

The tank is fastened by drilling holes in the frame and by inserting the ends of the bolts projecting from the side of the tank and the nut fastened on. This makes the frame stronger and keeps it from twisting out of shape, at the same time being the neatest way to fasten in place.

The front landing chassis is made up from umbrella ribs. Where the ends are fastened to the frame the rib is heated red hot and when cool flattened out with a few strokes of a hammer and fastened with thread and glue.

The wheels are of cork or wood 2″ in diameter. The tail skid is made up of steel wire as shown and is fastened as before.

The rear wheel can be smaller in diameter and is also cork or wood. The wings should be made as light as possible and are built up of bamboo strips and dowel stick 3/16″ in diameter. They are of the single surface type, the silk being fastened with glue to the top surface and doped.

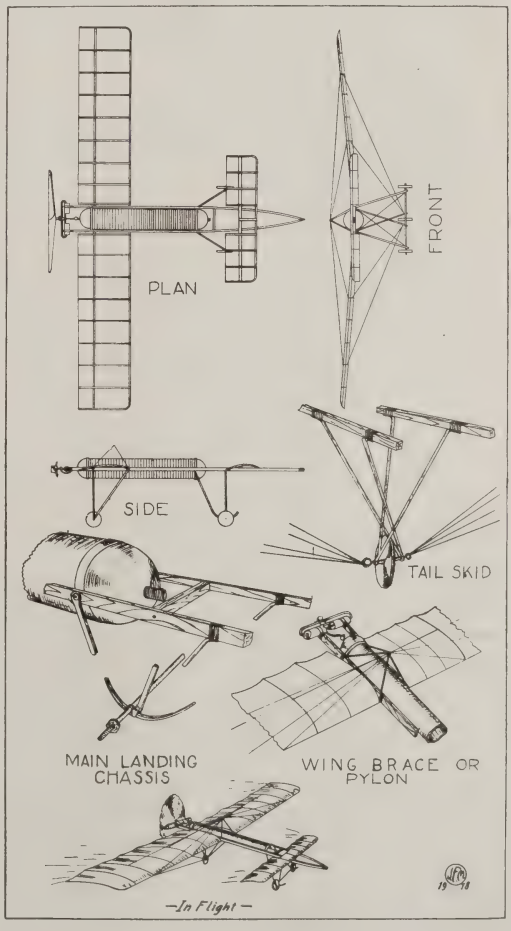
The main spars of the wing should be planed to a half round section. The bamboo strips being fastened to the flat side of the spars. The trailing edge of the wings is formed by stretching strong linen thread from rib to rib as tight as possible. When the silk is fastened in place it will form what is known as a feathered edge and is very efficient.

The main planes have a total spread of 54″ x 8″, chord elevator is 18″ x 4″. When constructing the elevator the centre rib runs to the rear spar only to allow the plane to set at an angle of incidence to the line of flight.

The pylon or brace over the main planes is made of thin steel wire and fastened at the point shown in the drawings. When ready to fly the model be sure it is balanced properly. It is better to set the entering edge of the plane about 3″ back of the centre of gravity. The elevator can be moved back or forth according to the glide.

It is better to start the model from the ground rather than from the hand, as it is almost impossible to spin the propeller, turn on the air and throw the model at the same time without a chance of mishap.

The model builder can construct a sort of a trigger arrangement for turning on the air, such as an arm soldered to the air "shut off" and a spring fastened to the tending to hold the valve open, to close a sort of dog is fastened to hold the valve closed and when pressed by the finger it moves away, allowing the arm to swing back to the open position.



I might call attention to the size of the propeller. This should be from 12 to 16″ in diameter, the proper size can be determined by experiment.

The landing chassis must be made long enough to hold the model properly the correct distance from the ground to keep the propeller from striking when getting off.

Flights of compressed air models vary. Some engines I have made showed no leakage of air and the model would not fly as well as when the leaking of the air could be heard distinctly. Of course, I do not say that the engine that leaks is the best, but I do believe that if the model builder is unfortunate enough not to make his apparatus air tight he can still get some reward for his work.

Some pretty scale models can be made powered with a compressed air motor. The famous Continental Aircraft Companies' pusher is very well suited for this purpose. The tank, which must be made shorter and larger in diameter, takes the place of the body and resembles it a great deal. Drawings of the Continental machine appeared in a previous issue of AERIAL AGE.

(To be continued)

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

The Barracks Aviator

By Jim

(*With Apologies to Rumyard Tipling*)

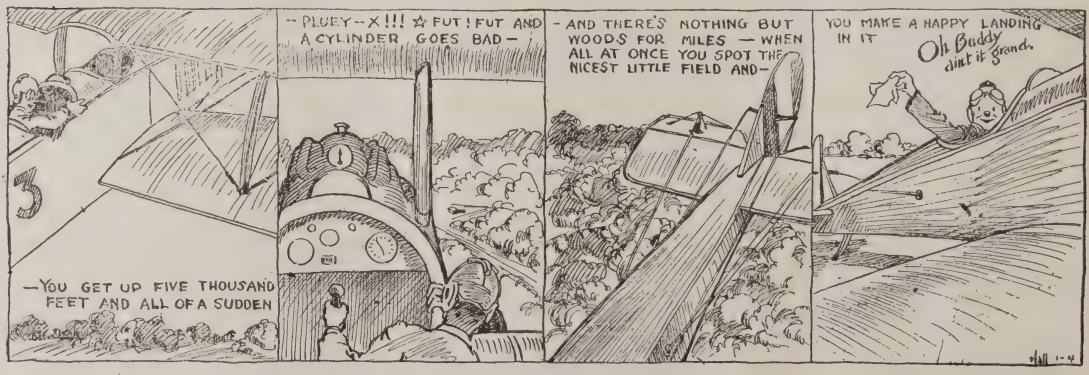
I've taken my work where I've found it;
  I've roved and I've roamed in my time;
I've had my pick of positions,
  And three o' the lot—they was prime.
One was with pick and with shovel;
  One on a soft, easy chair;
The third was to ride, like a devil, astride
  O' a ship into space through the air.

Now I ain't no hand at hard labor,
  And sittin' still isn't my game.
The first is too hard on the back-bone;
  The second too hard on the brain.
There's things that you know that you might do,
  And some that you guess that you might;
But what you can learn from the H and the Dep
  Will help you a lot in a fight.

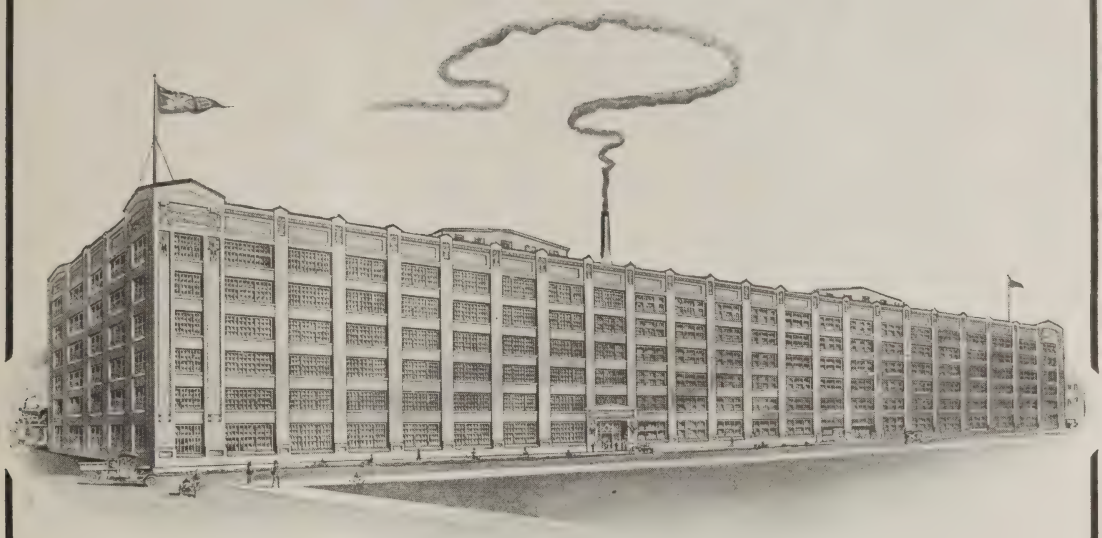
I was a wild young beginner,
  Stepped with the best on the ground,
Strutted in helmet and goggles,
  Swellest that ever was found.
Up in the air like a rocket,
  Back down I came like a stone;
Oh, the air it was blue, when the tutor came to,
  And found I had ne'er broke a bone.

The first time I went up for solo,
  I stood all alone in midair;
The earth down below me was rolling,
  And acting most awfully queer.
My stomach in unison mocked it,
  A queer lump rose up in my throat.
Says I to myself, "If I ever get down,
  I'll work on the ground when I'm broke."

I went for a ride on cross country,
  The day was quite clear and dead calm.
The ship floated on quite an angle,
  Then suddenly dropped like a bomb.
First she fell into a tail spin,
  Then came out of it flat on her back.
Perhaps you have seen Baird and Salmon,
  They're Aces—I'm only a Jack.



The vision I had when I hung there,
  On life belt, with head hanging down,
Was not a nice thing to remember,
  So I'll just pass it by with a frown.
Miss Phoebe, of Tale Spins, stood weeping,
And Marge, in her languishing way,
  Said, "Kid, here's your lid, come on now let's skid.
  For Marshall is due back today."



With a comical flip of her rudder,
  The ship straightened out and sailed home.
I was met by a man in a side car,
  With a heart that was built out o' stone.
He told me in old-fashioned English,
  The things that I never should try;
But I was so sick, his advice wouldn't stick,
  I thought that I surely would die.

I've taken my work where I've found it;
  My work and pleasure were one;
But now that I'm here in the army,
  I work like a son-of-a-gun.
It's better than pick and the shovel,
  It beats that old, soft, easy chair;
For my Uncle, I ride, like a devil astride
  O' a ship, into space, through air.

June

OH, June,
You month
Of War Brides
And Vacations
And Peek-a-boo waists,
Transparent hosiery
And Swimmin'
With Wimmin,
Hay Fever and
Nice, cool
Rin Gickies—
Oh, Damn the Kaiser.
And Then
The Average man imagines
That
There are only
Ten Commandments
Until
He gets Married.

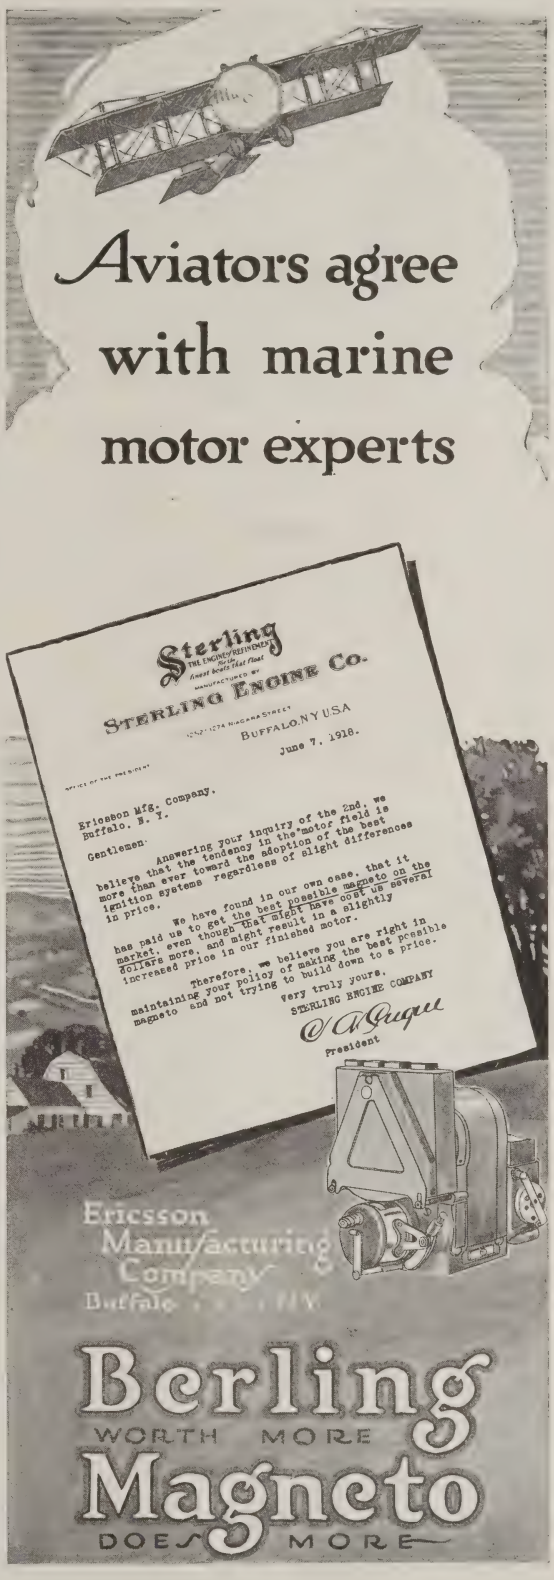
Organized College Research

THE House Committee on Education has recently given a hearing on House Bill No. 9686, known as the Smith-Howard Bill, which proposes to establish engineering experiment stations in the states and territories and the District of Columbia in connection with state-supported universities or engineering schools for the promotion of engineering and industrial research as a measure of industrial, military, and naval preparedness in times of peace or war. A large volume of the most enthusiastic endorsements was presented at the hearing, and it is expected that the Committee will shortly report the bill favorably to the House.



This legislation will fill a long felt need in America. It is considered a war measure of first magnitude because it will immediately establish the greatest organization of research and experimental facilities in the world. The best equipped technical school in each State is to be selected as the location of the proposed state Engineering Experiment Station. $15,000 per annum is appropriated to each state to establish this work. As was the case with the Agricultural Experiment Stations, it is expected that each state will appropriate an amount equal to that provided by the Federal Government. In many instances states have appropriated two or three times as much money for the agricultural experiment stations as is regularly appropriated by the government; and since the great productive value of the proposed stations will quickly become obvious, the stations will undoubtedly be provided with reasonably ample appropriations.

The same bill was introducted at the last session of Congress. Appreciating the tremendous possibilities of such a system of organized research, the officials of the Aero Club of America recommended that researches in aeronautics and aero-dynamics be included in the provisions of the bill. In the new draft of the bill, Mr. Phinehas V. Stephens, the author, has accepted these suggestions, and the board of governors of the Aero Club of America recently passed a resolution giving their unanimous endorsement of this legislation.

The Bill provides $25,000 annually in addition to that given to the colleges, to the Secretary of Commerce, who is to establish in the Bureau of Standards a department of college research for extending as far as practicable the facilities of the Bureau of Standards to those engaged in the work of the

Mr. S. S. Jerwan, veteran American aviator, who has been chief instructor of Guatemalan Air Service for the past four years. The photograph, reproduced herewith by courtesy of Mr. Charles Jerome Edwards, shows some of the trophies Mr. Jerwan has won in Guatemala

The big guns at the front are mounted on money. Don't forget that! And they will hold the enemy back only so long as their foundations last. Don't forget that!

This war cannot be carried on on loyal sentiment and armchair strategy. It has got to be carried on with big armies, powerful guns and everything guns and armies need for continued action.

War Savings Stamps will furnish the money provided you retailers enlist your salesforce at full power to sell the stamps.

Some of you have more salespeople at your command than a regimental commander has fighting men. Just think a moment of the selling power of a store as big as that. Just think of the stamps it could sell if it worked only 15 minutes a day. And the smaller stores can do as well in proportion.

Put in a Thrift Stamp Department today if you haven't already done so. And then push the stamps!

proposed experiment stations. The Department of Commerce will have general supervision of all of the stations, which supervision is intended to secure uniformity of methods, efficiency and the most economical expenditure of funds, by avoiding as far as possible useless duplication and by making available to each station the results of the work of other stations and that of the Bureau of Standards.

As a war measure this will bring into the use of the Federal Government more than $50,000,000 worth of the best scientific and research laboratories of the country, and this should constitute a very important stimulus to invention and research relating to our military air program and also the utilization of flying machines for commercial and social purposes after the war. The art of flying and the construction of aircraft is in its infancy. The establishing of these engineering experiment stations in each state will invite the inventive genius of the youth of America. It will also encourage such work by the members of the faculties of these engineering schools who are, as a rule, experienced in research and experimental work, but are without the financial support necessary for exhaustive research.

There will also be provided the opportunities for the manufacturers in each state to readily secure the solution of the multitude of problems that confront them in their various manufacturing processes. Each state has more or less natural resources now needing development, and these stations will serve the industrial development of the states in the same way that the agricultural experiment stations have helped to make America the greatest agricultural nation in the world.

Advanced List of Men and Colleges Agreeing to Cooperate in Securing the Passage of the Smith-Howard Bill

Dr. Jacob G. Schurman, Pres., Cornell University, New York.
Dr. E. E. Haskell, Dean, Cornell University, New York.
Dr. Richard McLauren, Pres., Massachusetts Institute of Technology, Mass.
Dr. Edmund J. James, Pres., University of Ill.
Dr. Edgar F. Smith, Provost, University of Pennsylvania, Pa.
Dr. K. G. Matheson, Pres., Georgia School of Technology, Ga.
Dr. W. R. Whitney, Director, Research Lab., General Electric Co., and member, Naval Consulting Board, N. Y.
Dr. W. F. Durand, Chairman, National Advisory Committee for Aeronautics.
Mr. Henry A. Wise Wood, Vice-Pres., Aero Club of America, New York.
Mr. Henry Woodhouse, Editor and Publisher, *Flying* and Aerial Age.
Dr. G. M. Butler, Dean, College of Engineering, University of Arizona.
Dr. Guy Potter Benton, Pres., University of Vermont.
Dr. Melvin A. Brannon, Pres., University of Idaho.
Dr. Irving Fisher, Yale University, Conn.
Dr. H. A. Bumsted, Sloane Laboratory, Yale University, Conn.
Dr. Joseph F. Merrill, Director, School of Mines and Eng., University of Utah.
Dr. Harold S. Boardman, Dean, College of Eng., University of Maine.
Dr. Frank L. McVey, Pres., University of Kentucky.
Dr. Frank J. Goodman, Pres., Johns Hopkins University, Maryland.
Dr. Robert Sharp, Pres., Tulane University, Louisiana.
Dr. Victor C. Alderson, Pres., Colorado School of Mines, Colorado.
Dr. J. R. Benton, Dean, College of Engineering, University of Florida.
Mr. George J. Baldwin, Vice-Pres., American International Corp., N. Y.
Dr. William McClellan, Director, Inter. Collegiate Intelligence Bureau, University of Penna.
Dr. Harold Pender, Board of Managers, Am. Inst. of Electrical Engrs.
Mr. W. H. Wiley, Pres., John Wiley & Sons, Scientific Publishers.
Dr. A. W. Brown, Prof. of Chemistry, Cornell University, New York.
Dr. Adelbert P. Mills, Prof. of Materials and Testing Lab., Cornell University.
Dr. Geo. P. Pegram, Dean, School of Mines, Eng. & Chemistry, Columbia University.
Prof. Henry S. Jacoby, Cornell University.
Dr. Charles E. Locke, Massachusetts Inst. of Technology, Mass.
Dr. W. L. Burton, Pres., University of Minnesota.
Dr. Samuel Avery, Pres., University of Nebraska.
Dr. E. E. Sparks, Pres., Pennsylvania State College.
Prof. R. L. Sackett, Dean, College of Eng., Penn. State College.
Dr. E. C. Persio, Pres., South Dakota State College.

Capt. Puckett is Field's Official Chaser of Flies

Capt. Carl Puckett, official "fly chaser" of the Kelly Field Flying Department, walked 303 miles during the month of July, trying to find a fly in the kitchens and mess halls of his "beat." His pedometer tells the tale.

Every day Capt. Puckett visits every kitchen and mess hall in the Flying Department, which means that he walks ten miles every day. If he saw a fly during the entire month, Capt. Puckett has no recollection of it now. The field is remarkably free from them, according to his statement.

This condition has been brought about by the constant warfare waged against flies by every mess sergeant, cook and "K. P." in the Flying Department, under Capt. Puckett's supervision. Traps and swatters are the weapons used in fighting flies, but eradication of breeding places has worked the worst hardship.

Capt. Puckett also serves as Herbert Hoover's right-hand man in the Flying Department. It is a part of his business to check up the food wastage and to see that it is reduced to the minimum. Through the hearty co-operation of mess sergeants and cooks and the men themselves, food waste is negligible, and could hardly be further reduced, Capt. Puckett says.

The Flying Department's "official fly chaser" is the second oldest man at Kelly Field in point of service at this camp. He is outranked only by Capt. S. R. Evans. He has been at Kelly Field eleven months and has been in the sanitary inspection department since February 1.

Capt. Puckett was a practicing physician in Pryor, Okla., for thirteen years before he came into the army. He was physician for the State Orphans' Asylum for seven years and County Superintendent of Health for three years.—*Kelly Field Eagle.*

Use Movies to Train Pilots in Gunnery

An American Aviation Training Camp in England.—The moving picture is being widely used in the training of American pilots in this country. The young flying officers who are sent to the armament school here to acquaint themselves with the use of aeroplane guns and gun-gears find their three-weeks course a most interesting one, owing partly to the large share which the moving picture machine plays in the instruction.

The pupil is not required to sit out a lengthy lecture read aloud from the notes of an instructor. Instead, the various branches of gunnery training, such as the stripping and assembling of guns, and the various points to be observed before, during and after flight, are demonstrated by films, accompanied by concise explanations by competent officers.

Frequently a film is run over the screen several times at different speeds so that the pupil gets a very intimate idea of the process being illustrated. Monotony and complexity finds no place in this method of training.

The films standardize the correct methods, and their instructional value is far-reaching. The film work is not confined to gunnery alone, but is continued in the other technical courses, such as aerial tactics and bomb dropping. According to British instructors, the use of the film has shortened and improved the course of training in these departments very materially.—*The Fly Leaf.*

Open Camp John Wise Hospital September 1

The new field hospital at Camp John Wise was formally opened September 1 with appropriate ceremonies. The program included a concert by the new cantary band and speeches by camp officers and leading citizens and physicians of San Antonio. The hospital is equipped with every known modern device and its erection was personally supervised by Capt. Phillip J. Lipsett, Post Surgeon. Four wards consisting of the general, surgical, isolation, and officers, compose the hospital. It also has a dental room with full equipment. It has a capacity of 60 patients.

Aircraft Board Needs Men

Washington—The Bureau of Aircraft Production has been authorized to make a limited number of voluntary inductions of men registered under the present draft. An urgent need exists for accountants and manufacturing cost clerks who have had either office or factory experience. Induction is open only to men in Class 1A, who are classified for limited service or who are in the remediable group, and to men placed in deferred classes on account of dependency.

The work to which applicants will be assigned is declared to be not only of great service to the Government in the production of aeroplanes, but it will prove of benefit as well to the individual in the training which he will receive. Applicants should communicate with the Personnel Officer, Finance Division, Bureau of Aircraft Production, 119 D Street, Washington, D. C.

Location of Forty Air Squadrons

Of the forty air squadrons, whose organization was recently authorized, four will be located at Houston, Texas, and thirty-six, or a training brigade of three wings, on Long Island, N. Y. The

The VICTOR AIRCRAFT CORPORATION

TRADE MARK

FACTORY

Freeport, Long Island, New York

base of this Long Island training brigade, as now planned, will be Hazelhurst Field, near Mineola. The squadrons will be quartered in groups of four on nine outlying fields. These squadrons are to serve under field conditions, simulating as nearly as practicable the conditions behind the lines in France. They will train as organizations, and it is hoped to furnish them completely with personnel and equipment so that when they have finished their training in the brigade very little additonal training will be required before they take their places on the front. This will also enable them to be sent to Europe in complete squadrons instead of detachments as heretofore. The outlying fields on Long Island, which will be used for the new enlarged training operations, will be Brindley Field, at Commack; Lufbery Field, at Wantaugh; Mitchel Field, at Mineola, and Henry J. Damm Field, near Babylon. Five more will be occupied eventually.

New Army Balloon School

To complete the construction of the new balloon school at Lee Hall, Va., the allotment of $203,000 has been approved by the Assistant Secretary of War. This balloon school is for the training of officer observers in the control of artillery fire from observation balloons. Lee Hall will be a finishing school for Air Service officers in aerial observation and will co-operate with artillery stationed there. In this manner the officers will receive actual experience in artillery fire adjustments, directing the same from observation balloons in the air, just as they will do at the front. The completed plans for the new school include about sixty buildings, among them a balloon shed, aero repair shop, garage, firehouse, photo laboratory, as well as mess halls, barracks, school buildings, etc. The capacity of the school will be more than 1,000 men. Major Harry R. Vaughn is the commanding officer. It is expected that the buildings will be completed and that the school will be in full operation within two months. It is also announced that in order that the work of training men for heavy artillery may be developed as rapidly as possible and under the most favorable conditions, it has been decided to increase the size of Camp Abraham Eustis at Lee Hall at once. Orders have been issued to the Construction Division to proceed with the work. It is estimated that the additions will cost $1,940,000. The enlargement calls for motor transportation schools for 500 students, garages, repair shops, a short railroad, concrete roads, new ranges and barracks and quarters for one trench mortar battalion and one anti-aircraft battalion.

Naval Aviation at Dunwoody

Minneapolis, Minn.—Following close on the inspection of Dunwoody Naval Training Schools last month by Capt. Thomas J. Senn, U.S.N., Assistant Chief of Bureau of Navigation, came the request from Washington for Comdr. Warren J. Terhune, U.S.N., commandant, to submit a prospectus on facilities available in Minneapolis for expansion of the work in aviation. The result of this move is the authorization by the Navy Department of the third regular ground school for student flight officers. The two ground schools previously established are at Massachusetts Institute of Technology, Boston, and at University of Washington, Seattle.

Since last November, when Lieut. Colby Dodge, U.S.N., initiated student pilot training at Dunwoody, aviation activities in Minneapolis have swiftly matured. The second class of "near officers," rated CQM (A), depart for naval air stations on the east coast early next month, while the third quota (25 men), detailed to Minneapolis from outside points, arrives this week to begin training. The first two classes were all enrolled locally, and while many additional students will continue to be ordered here from elsewhere, it is hoped to obtain from the Twin City community further contingents of excellent material as soon as Navy recruiting re-opens.

According to the new schedule of ground school instruction recently issued by the Department the course is limited to eight weeks. For the present it is the intention to maintain the Dunwoody pilot classes to the strength of 100 men, four classes of twenty-five men each, and as the senior class is transferred East for flight training, what might be called the freshman class begins, while the other classes advance correspondingly. Ens. William Eastman, U.S.N.R.F., aviation officer, is now in Boston receiving further instructions for handling new men.

Dunwoody is reckoned particularly fortunate in having as instructors for the four principal ground school subjects (navigation, rigging, gunnery, motors) four former officers of the British Flying Corps, three of whom were naval aviators on duty in the North Sea and the other a member of the Royal Flying Corps at the front in France.

Field at Ellington Is Enlarged

Washington.—During the coming winter Ellington Field is to be one of the busiest aviation camps in the country. Plans to this end are now being worked out by the aviation branch of the signal corps.

The new draft act, which paves the way for the induction into the army of more than 2,000,000 men, means the increased use of all of the army camps and cantonments in the Southern States. It will be impossible to give the character of intensive training in the Northern camps which the army contemplates in order to have these new fighting forces ready for transportation to Europe in the early spring in readiness for the great drive that is to be made through the Hun lines in the expectation of bringing the world war to its closing stages in 1918. The Southern camps will be filled to their capacity and kept at that stage throughout the winter months in order that there may be no let up in the training of the men. Winter weather in the Northern camps will prevent this character of training.

Ellington Field has been reorganized into one of the big bombing fields of the country. The six new steel hangars now being erected there by troop labor are intended to afford added facilities to meet this new and extended field of operations at Ellington. These steel hangars will cost between $9,000 and $11,000 each and are to be completed with all possible speed. The 333 acres of land recently added to Ellington Field have been designated as the site for the bombing practice to be afforded the cadets. This new land added to the extensions at Park Place and San Leon makes Ellington Field one of the very largest in the country.

Cadets who are drilled in bombing work will be flyers who have passed through their preliminary training at other aviation fields and are then detailed to Ellington on their work.—*Houston Post.*

Finger Prints

In compliance with general orders from Washington the post surgeon at Ellington Field will take all the finger prints of the officers of the field. These records will be forwarded to Washington and placed on file, giving the department a means of positive identification.—*Talespins.*

New Honor Medal Open to Everyone

America's new medal of honor may be won by officers and men of the American Army who have performed in action "deeds of the most distinguished personal bravery and self-sacrifice," under orders issued by General Pershing and made public by Secretary of War Baker.

The distinguished service cross and service medal may be awarded officers and men of the Allied as well as the American forces and also to nurses and other women serving with these forces. The service cross will be awarded to anyone who distinguishes himself or herself by exceptionally meritorious service to the Government in a duty of great responsibility in time of war in connection with operations against the armed enemy of the United States.

PRECISION
BALL BEARINGS
(PATENTED)

Service—the supreme test of men and of machines—the thing expected and exacted from all—the measure of value of an individual and of a commodity—the times have given the word a new and higher significance. And service today means more than adequacy to ordinary demands—it means an available reserve equal to any emergency.

Guided by experience—warned by previous failures—builders of dependable ignition apparatus and lighting generators standardize on "NORMA" Precision Bearings—knowing that "NORMA" serviceability helps any machine measure up to the service conditions which the times impose.

Be SURE. See that your electrical apparatus is "NORMA" equipped.

Where Speed Begins

In developing the remarkable standards of speed which the airplane must now meet, great lightness, with strength, is indispensable.

In lightness, speed has its real beginnings.

And while no single factor can claim the credit for making possible the lightness of the airplane, certainly few have been of greater importance than the use of *Lynite* in the place of heavier metals.

Lynite is rapidly becoming the metal of the air. Only a few years ago a comparatively unknown product, it is being used today for thousands of airplanes.

Lvnite alloys have been developed to the point where they have practically the strength of cast iron with only a third the weight.

Moreover, the processes of casting *Lynite* have been so far advanced that it is now made into engine cylinders, pistons and other parts requiring a degree of foundry expertness unknown a few years ago.

The extent of the service which *Lynite* is performing not alone for the airplane industry but for the automobile and other industries as well may be judged from the fact that it now takes eight foundries to meet the demand for it.

DE HAVILAND FOURS MEET BATTLE TEST IN REDUCTION OF ST. MIHIEL SALIENT

AMERICAN-MADE aeroplanes, driven by Liberty motors, played an important role in our reduction of the St. Mihiel salient. Edwin L. James writes about their performances in the New York *Times* as follows: While we owe thanks to the French, British, and Italians for the major part of the great aeroplane concentration, a considerable proportion of it was Simon-pure American.

The machines in use were De Haviland fours, two-seated biplanes. We used them primarily for bombing, but our intrepid aviators also used them for pursuit machines and for strafing the German lines.

To the work of our airmen was due in great part the large number of prisoners captured. The main avenue of the German retreat was the highway from Vigneulles to (name of town deleted). Because of mud this road became jammed Thursday and Friday and offered a good mark for our aviators, flying low, who sent machine-gun bullets by the thousands into the German lines along the highway, achieving very good results. In this work our American-made machines also did effective work, dropping small bombs and making many direct hits.

Our pursuit machines proper, of course, were of French make. But, as a test of the Liberty motor planes, a number of our pursuit squadrons Thursday and Friday included De Haviland fours, which gave a most excellent account of themselves, being credited with part of the bag of (deleted) Germans we got Thursday. These machines were not able to dive and manoeuvre with the pursuit planes, but, having guns at both front and rear, they did not have to do so much diving out of the way as the pursuit machines, which are single-seated, with only one gun pointing forward.

But where the Liberty motor achieved the biggest success was in the development of speed against the German pursuit planes. One instance illustrates this. Three of our De Haviland fours at an altitude of 6,000 meters spied two Fokkers. The Fokkers fled with the De Haviland machines after them. The American machines had better speed than the Germans, and drew down on them. The Germans dived. Our machines got one and the other escaped.

This is a most hopeful development, for in view of our admitted present shortage of pursuit machines, the possession of a bombing or observation machine which can take care of itself against German pursuit planes will go a long way toward remedying the defect.

This was the first battle performance of American machines equipped with Liberty motors, and our air officers are enthusiastic over the results.

Our machines bombed Conflans and several other German strategic points north of our new line. Three ammunition dumps were set on fire, and other damage was done. Thursday and Friday we dropped sixteen tons of bombs in the St. Mihiel salient. The next few days promise interesting air fights. We still have the supremacy of the air in this sector, but it is no longer undisputed.

MILITARY AND COMMERCIAL VALUE OF A PERMANENT AERIAL MAIL LINE BETWEEN NEW YORK, CLEVELAND AND CHICAGO

By HENRY WOODHOUSE

BY demonstrating that mail can be sent from Chicago to New York by aeroplane in eight hours the Post Office has emphasized the military and commercial value of a permanent aerial mail line between New York, Cleveland and Chicago.

Government orders, specifications for war materials, contracts, bids, authorizations of various kinds can be sent by aerial mail at a saving of over one day. This means truly a day gained in the production of the things needed to win the war.

It means that the regular office correspondence which, in accordance with business routine, is mailed late in the afternoon in New York will reach Chicago the following morning, thus saving a full day. By the fastest train it would only arrive there twenty-four hours later, too late to be attended to that same day.

Makes Quicker Train and Boat Connections

The initial saving of one day in the transmission of mail from Chicago to New York and vice versa is greatly increased when the letter is destined to make train connections for the West or the North or boat connections for Europe or South and Central America and the Pacific possessions and China and Japan.

Then it means a saving of days and weeks.

$50,000,000 Worth of Aerial Mail Business Waiting Development of Aerial Mail Service

It means a great deal to the thousands of military and naval aviators who are fighting or preparing to fight this fight for Democracy and Civilization to know that there is a field being developed where they can continue their work after the war; and it means much to the Aeronautic Industry to know that the aerial mail service will use thousands of aeroplanes and motors after the war.

To run the 200 aerial mail lines already defined would take over 2,000 aeroplanes. To run a fairly complete aerial mail service in the United States, with lines across the Atlantic and to Canada, Cuba and Central and South America will take tens of thousands of aeroplanes.

To run a single line across the Atlantic will mean sending out two large aeroplanes every hour, with relays from New-

foundland to the Azores and from the Azores to Portugal, England and France. As they will be large machines, it will keep a large factory busy to supply the machines for a single line.

This will be equally true if the line is to be direct from the United States to Ireland, using large flying boats which may land at intervals to get fuel.

Here are a few points worthy of special consideration:

(1) If we all help the Post Office, within twelve months a dozen additional aerial mail lines can be established, and the Post Office will be able to send by aeroplane at least half of the one hundred million day and night letters and of the fifty million special delivery letters that are being sent each year in the United States.

(2) The day and night letters average close to $1 each, and special delivery letters thirteen cents each, making a total of over fifty million dollars worth of business which is waiting for the development of the aerial mail service.

(3) Aerial mail day letters are most effective within distance of 400 miles. Night aerial mail letters are effective over any distance, because the aeroplane can carry mail over 1,000 miles between 6 P. M. and 8 A. M.

(4) The aerial mail system will be much more efficient and cheaper than the present telegraphic night and day letter system can be, because the sender can send a letter written in his office which does not have to be transcribed by an operator, who may make mistakes, and the message will reach the person to whom it is addressed without anybody else reading it, thereby insuring greater privacy. The cost of an aerial mail letter will be only sixteen cents, for which price there can be sent a message that would cost $5 or more by telegraph.

(5) Twenty-five million dollars worth of parcel post can be sent by aeroplane, and about as much of trans-Atlantic mail.

(6) As you probably know, the Post Office pays eighty cents a pound to steamships of American registry to carry mail across the Atlantic. Charging one dollar per letter sent by aeroplane across the Atlantic, will make mail carrying across the Atlantic and across the Continent a paying proposition even now. The super Handley Page or the 2,100-h.p. Caproni could take easily in the fuselage fifty bags of mail, weighing fifty pounds each, making a total of 100,000 letters each trip.

Passenger Carrying Between New York and Chicago in Six Hours at $150 Per

Passenger carrying between New York and Chicago at $150 each is going to be a fair business proposition. A great many people would be willing to pay even more to cut the journey between the two cities down to six hours. We may predict that within two years we will see air lines between New York and Chicago having to run an aeroplane every half hour, having stations along the route, and having express and "local" service.

Liberty Giving Eight Miles to the Gallon of Gasoline

The Liberty motor is giving eight miles to the gallon of gasoline!

This is good news. This and other motors may be developed during the year to give ten miles to the gallon. This is true with land aeroplanes; with seaplanes, where the head-resistance is greater and the speed less, the mileage is somewhat less.

Marvelous developments have taken place since, which shows that even a single motored aeroplane can be made to operate daily for months without interruption, on schedule time.

During the month of August the air mail service between Washington, Philadelphia and New York was conducted without a miss, hitch or serious delay of any character.

The operations for the month were perhaps the most remarkable in the history of aviation. There were twenty-seven flying days on which 108 legs of the journey had to be performed, and in that month there were but two forced landings. One with a delay of seven minutes and the other with a delay of less than ten minutes. One forced landing was made within four miles of Belmont Park at the end of a journey. It was caused by the break of the magneto shaft. The other forced landing was made on a flight where fog and haze obscured the round and for the purpose of picking up the course because the compass failed to work.

The total possible miles of flight was 11,961, of which 11,957 miles were completed.

During the first ten days of the month, the routes were flown by Lieuts. Edgarton, Kilgore, Bonsal, Webb, Culber and Miller without a miss, hitch or forced landing. During the last twenty days of the month the routes were operated by the civilian flyers of the Post Office Department. The perfect scores were made by aviators Max Miller and E. V. Gardner. Aviators Maurice Newton and Robert Shanks on the Philadelphia end of the route, each had one forced landing, giving them a score of 99 per cent.

A total of 5,879 pounds of mail was carried on these trips.

This perfect record was performed with a very small but efficient organization, at such small cost that the aerial mail service can be made to pay for itself if there is sufficient aerial mail to carry 50 per cent. of their carrying capacity.

The aerial mail service is destined to be a very important factor in the war and in the reconstruction which will follow the war.

As these are not so much days of prophecy as they are days to clearly visualize things to be done, and to do them as fast and as thoroughly as they humanly can be done, the world is eager to get an idea of what it may expect, the hope being, of course, for a speedy success in winning the war, and hope that the reconstruction will give us a better world.

Aeroplanes Lifting 40,000 Pounds Possible

It is hardly necessary to point out that now that we have aeroplanes capable of lifting fifteen tons and going at a speed of about 100 miles an hour, the general application of aircraft for transportation is to come fast. A few days ago a despatch quoted Mr. John D. Ryan, the energetic Director of Aircraft Production, as saying that there is a type of aeroplane under consideration, which is to be equipped with four Liberty motors, or 1,750 horsepower. Such an air cruiser would probably be capable of lifting close to 40,000 pounds, and the limit in size has by no means been reached. A 5,000-horsepower air cruiser may cleave the air in a year.

Delivery of mail across the Atlantic and across the continent may be as common next year at this time as the delivery of mail by aeroplane on the New York-Philadelphia-Washington route is today. The mail will be much heavier over long distances, because the aeroplane will make it possible to make deliveries a number of days sooner.

Closer Understanding Between Nations—or Another Menace to Our Generation

The fact that the radius of flight of aeroplanes is extending to 2,000 miles, and may extend to 4,000 miles within two years, brings hope for closer understanding between nations after the war, due to faster transportation and intercommunication, but also brings the menace of disaster which may befall our generation if the control of the air falls in the hands of warlike people.

Germany is planning extensive aerial mail, express and passenger transportation lines to employ the output of her aircraft factories after the war. Germany's plans are extensive enough to employ tens of thousands of large aircraft. This would give her a reserve air fleet large enough to blow England, France or Italy and the cities on the American continent off the map overnight. As was brought out in the House of Commons by Lord Montague, aircraft can be turned from vehicles of transportation to war machines by the simple process of substituting bombs for cargo. We all hope, of course, that some agreement will be reached between nations which will guarantee against such a horror as the bombing of a nation out of existence over night by another nation having tens of thousands of aeroplanes. But the present war has shown that hope does not save nations from the outrages of aggressors. As a matter of fact, Germany's first air raids on Belgium, France and Great Britain were conducted by Zeppelins, which were employed for passenger carrying before the war. So while keeping our hearts in the right place, the Allies must be ready to protect the Rights of Humanity and the Cause of Civilization.

Anything that is done to bring into use thousands of aircraft for civic purposes is a contribution towards placing the United States and the Allies in the position of the porcupine which goes about its peaceful pursuits, harms no one, but is ever ready to protect itself. The Post Office can use thousands of aeroplanes for the aerial mail service—which will form a valuable reserve for national defense.

Unused Resources to be Developed by Aerial Mail Service

There are thousands of men who have volunteered for the air service, but cannot be accommodated, who can be used for the aerial mail service; and there are extensive manufacturing facilities not being used for war purposes, which can be kept busy building aerial mail planes. By using these unused resources, the Post Office can develop reserve aviators and manufacturing resources which can be used for war purposes when needed.

We have had occasion to submit these facts to leading Allied authorities and they agree with us that it is necessary to look ahead. Ambassador Jusserand in a recent communication states:

"You are quite right. Honest nations must not only be more honest, but also stronger and cleverer than the other, so that honesty and not barbarity may prevail in the world.

"France and America owe to their past to see to it that the mastery of the air, as on the earth and in the waters, be held by those who believe in justice and in the sanctity of the pledged word. The lands of the Montgolfier brothers and the Wright brothers, must and shall keep their rank and justify their fame.

"All success to aviation in the service of international honesty.

Sincerely,

(Signed) Jusserand."

THE NEWS OF THE WEEK

Signal Corps Returns on Aeronautical Property

War Department General Orders, No. 71.

III. 1. All Aviation and Aircraft property now carried on Signal Corps returns, as of June 30, 1918, will be invoiced to the proper supply officers of the Division of Military Aeronautics and the Bureau of Aircraft Production, and separate returns of Signal Corps supplies, Aviation suppies and Aircraft supplies shall henceforth be made. The property return of the Signal Corps supplies will be rendered to the Chief Signal Officer for auditing, and the property return for the Aviation suppliess will be rendered to the Director of Military Aeronautics for auditing and the property returns for Aircraft supplies will be rendered to the Director of Aircraft Production for auditing.

2. Signal Corps supplies will consist of supplies other than Oeronautical, designated as Fire Control and Signal Corps supplies in the authorized Signal Corps Manuals; and all Aeronautical supplies heretofore considered Signal Corps supplies will be construed as Aviation supplies and Aircraft supplies.

3. Aircraft supplies will consist of those supplies necessary for the production of aeroplanes, aeroplane engines, aircraft equipment, unfinished, unattached or unassembled aeroplanes, aeroplane engines or aircraft equipment. Such Aircraft supplies will automatically be transferred and become aviation supplies on delivery to the Department of Military Aeronautics by the Bureau of Aircraft Production, the transfer being effected on the bill of lading. Such supplies will be invoiced to the receiving Supply Officer of the Department of Military Aeronautics by the Supply Officer of the Bureau of Aircraft Production, who makes the shipment. These supplies when received by the Department of Military Aeronautics and all other supplies now considered as Signal Corps supplies with the exception of those described above as Aircraft supplies and Signal Corps supplies will be construed as Aviation supplies. The decision as to whether Aeronautical supplies are Aircraft or Aviation will be based on the distinction drawn in General Orders, No. 51, War Department, 1918.

4. All Signal Corps supplies as accounted for in proper returns up through the period ending June 30, 1918, will be audited by the Chief Signal Officer of Army and this order shall operate as from July 1, 1918. All returns rendered to the Chief Signal Officer, for auiiting for period ending June 30, 1918, and all previous periods, will remain the property of the Chief Signal Officer.

Americans Cited by General Pershing

Washington—Graphic stories of the individual heroism and daring of American officers and men fighting in France are told in cryptic citations by General Pershing in awarding them Distinguished Service crosses. The citations were received at the War Department on September 5.

Second Lieutenant Fred A. Tillman, A.S.H.C. —He aroused the admiration of all the French first-line infantrymen when making an infantry liaison west of Rheims, June 26. He flew over the enemy lines at an altitude of only 150 metres, in spite of violent machine-gun and anti-aircraft fire. Shot down between the lines, with his plane riddled with bullets, and his pilot severely wounded, he picked up his pilot in his arms and carried him through heavy fire more than 200 metres to the French first line, after he was himself wounded in the neck.

First Lieutenant Edgar G. Tobin, Aero Pursuit Squadron—While leading a patrol of three machines in the region of Neuville July 16 he attacked an enemy formation of six single-seaters. He destroyed two himself and forced down a third out of control.

Sergeant Frank Gardello, Jr., Infantry—When two enemy aeroplanes flew parallel to our infantry lines north of the River Ourcq, near Villers-sur-Fère, July 28, pouring machine-gun bullets into our positions and driving everyone to cover, Sergeant Gardello rushed to his machine gun and took aim at the upper of the two machines. Although he was constantly subjected to a storm of bullets from the planes and from enemy snipers on the ground, he nevertheless coolly sighted his gun and riddled the upper plane. It collapsed and fell in flames, striking the lower one as it fell and causing it to crash to earth also.

Schieffelin Commended

London.—Ensign John Jay Schieffelin of New York has been commended by the British Admiralty for his energetic attack on a German submarine in the North Sea while on patrol duty August 19. He observed a submarine on the surface and dived to attack. He succeeded in hitting the U-boat with a bomb, severely damaging the craft. At the same time he gave warning to an allied convoy of the proximity of the U-boat.

In connection with the mention of Ensign Schieffelin's feat the Admiralty announced that American aircraft have begun operations from the new base on the Irish coast.

Lieut. Edward Milton Urband, A.S.Sig., R.C. He graduated from the Aviation School at Ithaca, N. Y. He has brought down two German planes up to date

U. S. Bomb Program Gets Fritzie's Goat

Colonel C. V. Clark of the Air Service has outlined an interesting program on bombing as carried out by American aviators in France. Under present condition on the Western battle front material damage must be done by night bombers, says Col. Clark. Day bombers will be used solely for the moral effect of inflicting perpetual unrest except in a few special cases when vulnerable objectives are difficult to locate at night.

The primary military functions of the day bomber are:

(1) To bomb important points, such as small objects difficult to find by night, headquarters, small ammunition "dumps," small storehouses containing munitions or supplies, small railway junction, and small aerodromes.

(2) To bomb such communities as is considered desirable, especially factories and factory towns.

(3) To conduct long range reconnaissance, strategical reconnaissance, reconnaissance by staff officers or with camera.

(4) To do special photographic work so far beyond the lines as to necessitate great altitude, demanding a camera of great focal length and therefore great size and weight.

Leave Extended

Major Cushman A. Rice, Air Service, who returned several months ago from the fighting lines "over there" and who had been "gassed" while directing the American Aerial forces that were operating with the British army, has just been granted an extension of three months' sick leave. Major Rice is undergoing treatment at the Walter Reed Hospital, at Washington, D. C., and while improving in health slowly, is anxious to return to battle with the Hun. A bronze medal was presented to him on his recent trip to the west by the University of Minnesota in recognition of his patriotic services.

London the Rest Camp for Run-Down Airmen

London.—The American soldier on his first visit to London from some of the numerous camps around England often asks why there seem to be so many aviators strolling around the city streets, apparently without a care in the world. It is evident that many of them are veteran fliers, for they wear ribbons and decorations which could have only been won by great valor on the field.

Most of these men, the American learns, are "on leave." London is the great "rest camp" for aviators. After a long period of war flying in France they flock back to London to rest their nerves until the medical officers pass them for return to duty.

Two to four weeks is the average period they spend in this city. They naturally look forward to these periods of leave with great pleasure, but by the time their three or four weeks are up they are beginning to be anxious to get back into the atmosphere of gasoline.

U. S. Fliers in 94 Flights

Washington—American aeroplanes in France, according to official dispatches received, made 964 flights in the first two weeks of August, engaged in ninety-four combats and brought down at least twenty hostile fliers, one captive balloon and probably two other enemy aeroplanes not officially accounted for.

The American bombing planes attacked Conflans, Longuyon and Damourie in daylight, dropping 5,300 kilograms of projectiles.

The French fliers during the same time made nearly 14,000 flights, engaged in nearly 700 combats, took 10,000 photographs of enemy positions and dropped 31,000 kilograms of projectiles.

With the American Forces on the Vesle

German aviation is still desperately engaged in barring our fliers from having a look at their back areas. Despite a horde of Pfalz, Fokker and Albatross machines hovering about them, American aerial photographers have been getting quite a collection of interesting snapshots. German chasing planes are having a mighty hard time of it.

American Airmen Bomb Conflans

With the American Army in Lorraine.—American bombing machines in their attack on Conflans and Longuyon on September 4 were successful. In Longuyon the raiders dropped forty-four bombs, and seven direct hits were observed at the east end of the railroad yard, two on a roundhouse and repair shop, and two on other buildings. One American machine turned back after dropping its bomb. At Barencourt four direct hits were observed.

In the Conflans raid more than a ton of bombs were bunched on the junction of the Briey-Conflans-Metz railway. The bridge of the former road was destroyed. All of our machines returned safely.

Enemy bombers were active last night in the villages far behind our lines.

American aviators in a battle with Germans near Pont-a-Mousson routed the enemy. One enemy machine is believed to have been driven down.

With the American Army on the Lorraine Front

American bombing machines successfully attacked railway yards and buildings at Conflans, twenty-five miles east of Verdun, on August 30. Several direct bursts were observed. Enemy pursuit planes followed the invading Americans back to their lines, but did not attack them.

At noon American airmen dropped bombs on the railway yards at Longuyon (about twenty-five miles north of Conflans), scoring several direct hits.

Late in the afternoon conflans was again raided, but poor visibility made it difficult to ascertain whether the bombing was effective.

Enemy anti-aircraft guns were active against the American raiders in all three of the day's excursions. All of our machines returned.

One lone American aviator attacked a German who was driving at a French balloon. Six Germans were above him, but the American forced the German machine into a nose dive. The six other Germans then attacked the American and forced him to descend. He landed behind the American lines uninjured.

American Official Communique

Headquarters, American
Expeditionary Forces,
September 4, 1918.

Yesterday our aviators successfully bombed the railroad yards at Longuyon, Demmary, Baroncourt, and Conflans.

North of Toul one of our aviators shot down a hostile machine. On Aug. 21 and 22 our aviators successfully bombed the railroad yard at Longuyon, Audun-le-Roman and Conflans. Three and one-half tons of bombs were dropped and many direct hits were observed. All our machines returned.

With the American Army on the Vesle Front.—Lieut. Louis Verdier, formerly head of the Lafayette Flying Squadron, a brother of Paul Verdier of San Francisco, has been killed in action, according to information received.

No details are given in the report.

With the American Army on the Lorraine Front—An American air patrol of four machines on Aug. 29th met a German fokker in the region of Manonville and dived upon it. Lieut. Armstrong fired 230 shots at the enemy plane. There was a burst of flame from the fokker as it turned and made for the German side, falling as it crossed the line at Pont-a-Mousson.

A huge German triplane swooped down upon the American line near Pont-a-Mousson, showering the trenches with machine gun bullets. This craft made its escape, notwithstanding the violent anti-aircraft fire directed against it.

With the American Army in France.—Three German aeroplanes are believed to have been shot down on Sept. 10 by Lieut. Jacques Swaab of New York city.

On his return from a flight over the lines he engaged and shot down a fokker. He was attacked by a group of German planes, but shot one down in flames and forced another down out of control.

Lieut. Jacques Swaab is a graduate of the University of Pennsylvania, the son of Mayer Swaab, Jr., who is a member of Fleet & Co., with offices at 949 Broadway. His parents live in 88 Central Park West. Lieut. Swaab, who is 24 years old, had his aerial training at the ground school at Columbus, Ohio, the flying school at Dayton, Ohio, the Government school in France and six weeks' training in the aviation school in France.

Four Thousand Skilled Workers Wanted by Air Service

Major Wadsworth of the Aero Service of the United States Army is anxious to engage 4,000 skilled mechanics between eighteen and fifty-six years for work as aeroplane mechanics, carpenters, coppersmiths, instrument men, motorcyclists, vulcanizers, blacksmiths, cabinetmakers, chauffeurs, fabric workers, truckmasters, welders, propeller makers, motor mechanics and machinists.

Applications may be made any day between 8 A. M. and 5 P. M. to Lieut. Billker, room No. 902, No. 104 Broad Street.

Duesenberg Establishes Washington Office

The Duesenberg Motors Corporation has announced the establishment of a Washington office in the Munsey Building, in order to facilitate their intercourse with the various Government departments, as their entire facilities are being devoted to the execution of Government contracts. Mr. N. G. Rost, General Sales Manager, formerly located at No. 120 Broadway, New York, is making his headquarters at the Washington office for the duration of the war, and the Duesenberg Motors Corportaion will be glad to have its friends make use of this new office whenever convenient.

Lieut. Fileto Santos, one of the three young Brazilian aviators who are in this country studying the latest things in aeronautics on behalf of the Brazilian Government.

John D. Ryan Gratified

Paris.—On his return from a tour near the battle front John D. Ryan, American Assistant Secretary of War, in charge of air service, declared that he was much gratified by the work done by the aerial force of the American army.

Mr. Ryan's tour was made during the recent operation of the American army and gave him an opportunity to see the various American aviation activities in the zone of advance. He was accompanied by Gen. Patrick, chief of the air service of the American expeditionary forces.

As the American aviation centres are not yet completed Mr. Ryan said he desired to refrain from discussing that branch of the service at any length. He spoke in the highest terms of the brilliant exploits of the American troops.

Giant Plane Crosses the British Channel

London.—A big British aeroplane carrying its crew and nine passengers has made the trip from France to England, it is announced here. The whole journey from an aerodrome in the interior of France to one in the interior of England occupied little more than half an hour.

The test was made under routine conditions, with an ordinary service aeroplane of the largest type. The passengers carried the normal amount of baggage of travellers by train and boat.

Great French Ace Sends Down His 44th Foe.

Paris.—The newspapers announce that Lieut. Nungesser, the French aviator, has scored his forty-fourth official aerial victory.

That Strange Uniform

Have you noticed it? Do you know whether you are to salute him or not? Well, you are for he has the status of an officer and is an envoy of the Brazilian government. He is Alfredo C. Daudt of Porto Alegre, Brazil, and he came to this country to learn flying and then return to teach his countrymen how it is done. He came to this country about nine months ago and has just finished a course at the Massachusetts Institute of Technology. Other representatives of the Brazilian government are in France and England taking lessons in modern aero work. Daudt states that flying is in its infancy in Brazil and that their army has only a few planes and these are of the old types. The navy is better equipped in this respect than the army, but neither is up to date so far as flying apparatus goes. —Chanute Field Propeller.

Plan Action to Have Highway Taken Over

Arrangements for conferences with the military affairs committee of the House and Senate for hearings, about December 10, for the purpose of showing that the War Department should take over the Bankhead national highway running from Washington to Little Rock, Ark., are being made.

J. A. Roundtree of Birmingham, Ala., secretary of the United States Good Roads Association, and Col. Benneham Cameron of Stageville, N. C., chairman of the state highway commission and a member of the board of directors of the Bankhead highway, are arranging for the hearing.

The highway passes through Virginia, North and South Carolina, Georgia, Alabama, Mississippi, Tennessee and Arkansas. There are twenty-one cantonments and aviation schools on the highway.

Light and Dark Work Done by Night Bombers

Behind the British Lines in France.—The working month of a night bombing squadron in France is divided into two periods, which are known as the light and dark.

The light period covers the moonlit half of the month. Should it be attended by fine weather great aerial activity prevails. Practically any raid that is possible by day can be carried out equally well at night during this period. Although certain details are not clearly visible, the essential features of the ground stand out clearly and can be followed easily.

The ease with which targets can be found depend largely on their geographical position. Water is the great guide for night flying, and on a clear, moonlight night it can be seen from a great distance. Hence targets situated near a river, canal or lake present no difficulty whatever as regards their being found.

Railways, too, if they are in use, prove excellent guides, for the rails shine clearly in the moonlight and can be followed easily. Woods, especially, if they are of peculiar shape, make good landmarks. The black mass, which shows up well in the moonlight, can be quickly identified on the map.

During the light period most of the long raids of the squadron are carried out. The dark period, the moonless nights, is a much less active time.

New Aviation Camp in Michigan

Acquisition of 1,800 acres of land between Selfridge field and Lake St. Clair, near Mount Clemens, Mich., for instruction of aviators was announced recently by the War Department. The rental for the first year will amount to $52,000 and after that $40,000.

Frenchman, Inventor of Zeppelin, Dies at Paris

Paris.—Maurice Chevreaux, part inventor of the famous Zeppelin airship, is dead, and with his passing emphasis is given the fact that Count Zeppelin was not altogether the originator of the great airship that bears his name.

Chevreux, who was a French naval engineer, resided for some years in Germany and was employed in the Zeppelin workshops, and while so engaged he designed the six-cylinder motor by which Count Zeppelin was able to triumph over the difficulty of making a dirigible that would stay for hours in the air.

Balloon Observers Needed

Balloon observers are being sought by the Division of Military Aeronautics. This branch of the United States Army needs several hundred men between the ages of 25 and 35.

The qualifications necessary for this work is any technical training which will help him to read maps and photographs of the terrain and to calculate distances and angles. The Division of Aeronautics sends the successful applicants to one of its training schools, of which it has five—at Arcadia, Cal.; Fort Omaha, Nebr.; John A. Wise, San Antonio; Lee Hall, Va., and Fort Sill, Okla., the last two being the schools where the candidates get practice in connection with the artillery camps in those places. The candidates, upon the completion of their course, receive commissions as second lieutenants, and are sent abroad for further education.

Lieutenant J. C. Edgerton Weds

Washington, D. C.—The school-day romance of Lieut. James C. Edgerton, 1646 Park Road, reached a climax on Aug. 16 with his marriage to Miss Mary Olive Robinette, 15 3d St., Northeast. The ceremony was performed by Rev. Howard F. Downs.

Lieut. Edgerton first came into public notice when he successfully inaugurated the postal aerial mail service in a record flight from Philadelphia to Washington May 15. He piloted the plane which brought hundreds of historic letters from New York and Philadelphia to President Wilson and other high government officials.

Since the aerial mail service was put into operation, Lieut. Edgerton has made daily trips between Washington and New York, and is one of the few aeroplane mail pilots who has made the flights without an accident.

He is a lieutenant in the Air Service.

The AIRCRAFT TRADE REVIEW

Aircraft Motor Lubrication

John H. Torrey, Interior Combustion Engineer

As our up-to-date writings so generally center about the aircraft situation, it would seem permissible to add a few lines, keeping aloof from too technical outlining regarding the aviation motors which are specifically to be considered on phase of the very highest effort of mechanics to attain adjustments which will permit of the nearest approach to the objective goal—100% efficiency.

Allowing then that mechanics are true and so attested to; then it becomes the responsibility of those who are to account for the operation of the motors. The GAS or carburetting mixture must be correct, calling for the best of fuel product to admix under pressure and heat with the air, and right here it can be said that poor performances are more often due to poor carburetting than any other one feature. Now, with the mixture right, the last and not least important matter is to eliminate the fricion from the moving parts by introducing a lubricating product that will permit of the least quantity fed to film the metal surfaces and yet at the same time not carry into the chambers of explosion any suspensions that could possibly foul or leave a contamination or taint in such a degree as to diminish the efforts to eliminate said friction; as the presence of such bad segregation could only produce prematures and in short order bring about a stalling of the motor or such an erratic performance of the interior as to be sufficient warning to shut off the power.

Experience goes to show that *petroleum* furnishes us the best agency for the frictional elimination of interior combustion chambers, because a better film can be effected on the metal surfaces, the beats can be more successfully coped with and the fluidity and limpidity of such lubricant is not equalled by any other agency and as a necessity the rarity rather than density of the lubricant permits of the catering to the finest clearances of opposing metal surfaces. Phasings of necessity to get the correct lubricant must positively call for *baume* gravity, viscosity and flashing points. All these carrying high rather than low figures.

As the matter stands, both from laboratory and practical deduction, the correct lubricant for interior combustion chambers must come from, and it is proven that petroleum is the only sure agency and it is permissible to state as a final clause that the up-to-date product is at hand based on many years of practical caterings to interior combustion chambers.

Kettering to Address Detroit Section

Detroit.—C. F. Kettering, president of the Dayton Engineering Laboratories Co. and president of the Society of Automotive Engineers, will address the Detroit Section on the subject of the future of the aeroplane industry after the war. The meeting will be held on Sept. 20 at the Hotel Pontchartrain, Detroit, at 8 p. m. It is expected that a number of out-of-town people from the aeroplane industry will be present to hear Mr. Kettering's address.

Standardize Oil Specifications

Washington, D. C.—The Specifications Commission of the Allies has arrived in Washington to discuss the standardization of specifications for petroleum products for use by the American Government and the Allies. President Wilson recently announced in a proclamation that standard specifications would be drawn up and appointed an American committee.

The Specifications Commission from London comprises: W. Fraser, chairman; H. R. J. Conacher, secretary; Engineer Commander A. E. Hyne, Royal Navy; Captain W. E. Guttentag, British Air Ministry; Captain E. C. Paix, French Army; Captain L. Noyer, French Army; Major Galileo, Italian Navy.

The commission met in conference with the American Committee on Standardization of Petroleum Products, composed of the following members: M. L. Requa, general director oil division, U. S. Fuel Administration, chairman; J. W. Williams, secretary; Col. George E. Warren, appointed by Secretary of War; Admiral R. S. Griffin, appointed by Secretary of the Navy; H. L. Doherty, appointed by chairman of Shipping Board; C. B. Young, appointed by Director General of Railroads; C. H. Beal, appointed by Director of Bureau of Mines; Dr. C. W. Waidner, appointed by Director of Bureau of Standards. Further conferences will be held from day to day.

Personal Pars

V. Hughes has resigned from the Overland Motor Co. to enter Government service as aeronautical engineer, Aviation Section, Signal Corps, and is assigned to McCook Field, Dayton, Ohio.

Lots of Balloons

"We see so many 'sausage' balloons every day, that I am constantly reminded of Goodyear," writes J. A. Blatherwick, a former Goodyear Tire & Rubber Company workman, now stationed at a supply depot near the battle front in France. Ever since the breaking out of the war this company has been making observation balloons—known familiarly on the battle fronts as "sausages"—to furnish "eyes" for the Allied Forces. These balloons can be held at any desired height, while the observer gathers military information concerning the enemy and communicates it by telephone to those below. They are used extensively by the artillery for directing artillery fire.

Interned in Holland

Aviator Lieut. Don Harris, formerly of the Goodyear Tire & Rubber Company, Akron, Ohio, has been interned in Holland for the duration of the war. The report of his internment states his aeroplane was fired upon by anti-aircraft guns and struck in several places. He was forced to descend for repairs, but unfortunately was unable to get back to the American lines, and was interned before he could complete his repairs and get under way again. He reports the best of treatment by the Holland authorities.

The following is a list of purchases contracted for by the Bureau of Aircraft Production:

[NOTE.—The first number at the beginning of each paragraph is the Order Number, the second the Contract Number.]

August 6, 1918

20906-1. 3429. Standard Aircraft Corporation, Elizabeth, N. J., for services in the erection of 1 British Handley Page aeroplane.

30442-14. 2250-2. Wright-Martin Aircraft Corporation, New Brunswick, N. J., services and material in repairing motors returned from United States aerial mail station, Bustleton, Pa.

720151. 4038. Curtiss Aeroplane & Motor Corp., Buffalo, N. Y., 436 JN6H advance training planes with dual control and fixed gun only; 90 JN4H advance training planes with dual control and fixed gun only; 34 JN4H advance training planes with dual control and fixed gun only for the Navy.

730164. 4437. Splitdorf Electrical Co., Newark, N. J., 40 sets Dixie D800 magnetos and spare parts to be used in connection with all Hispano-Suiza engines, using 1 right-hand and 1 left-hand magneto.

820013. 4438. D. Nussbaum & Co., Union Course, Long Island, N. Y., 7,500 sweaters.

August 7, 1918

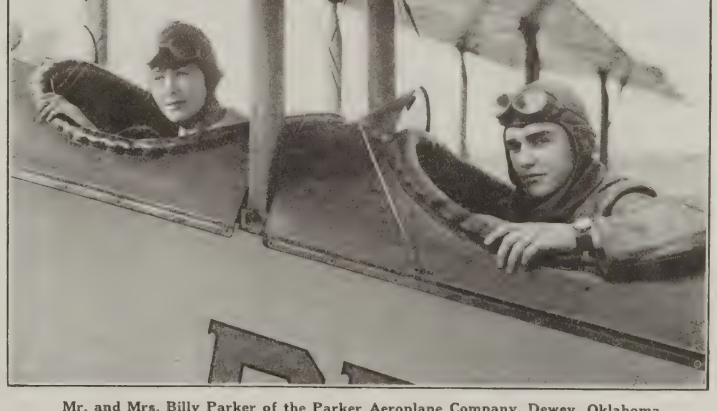
30442-15. 2250-2. Wright Martin Aircraft Corporation, New Brnuswick, N. J., repairs for Hispano-Suiza type A engines—crankshaft and hub assembly, crankcase assembly complete, water pump assembly, Dixie D800 magneto assembly, right-hand cylinder cover, tachometer drive assembly.

710114. 4436. Long-Knight Lumber Co., Indianapolis, Ind., 100,000 feet walnut lumber.

760090. 4430. British Munition Board, London, England, 125 lenses for airplane cameras.

August 8, 1918

30442-19. 2250-2. Wright-Martin Aircraft Corporation, New brunswick, N. J., spare parts for Hispano-Suiza engines—cylinder casting left-hand and right-hand aluminum assemblies, cylinder casting steel sleeve assembly.



720235. 4443. Firestone Tire & Rubber Co., Akron, Ohio, 436 outer casings (latest type now in production for Curtiss JN6H advanced training planes).

720237. 4442. Unit Construction Co., Philadelphia, Pa., material for 50 sets of laminations for Handley Page propellers.

720242. 4445. Hardman, Peck & Co., New York, N. Y., 1,000 sets of laminations for Handley Page propellers.

760104. 4444. C. F. Pease Co., Chicago, Ill., 1,125 100-yard rolls X-electric blue print paper.

780024. 4435. Lycoming Foundry & Machine Co., Williamsport, Pa., 15 sets tools, complete, for maintenance of Gnome aeroplane engines, type B2.

Mr. and Mrs. Billy Parker of the Parker Aeroplane Company, Dewey, Oklahoma

SOME METEOROLOGICAL CONDITIONS WHICH INCREASE THE DANGER OF FLYING

By Captain C. J. P. CAVE, R.E.

(*Concluded from page* 1323)

Rain, Hail, and Snow

The danger arising from these is obvious, and it varies, of course, from nothing in the case of very light falls to a real danger in the case of very heavy falls. Danger from very heavy rain or from hail can often be avoided by keeping away from cumulo nimbus clouds. Such clouds are often seen in isolated masses, some miles in circumference, perhaps, but still they can on such occasions be avoided. In the case of a line squall it is, however, not possible to fly round the cloud, for this often extends in a long line for several hundred miles. It might be possible to fly over a line squall and so avoid the rain, hail, and turbulent motion of the air associated with the disturbance; but I do not know that there is any evidence as to the heights to which the line squall disturbance extends; it probably varies on different occasions.

Hailstones in summer thunderstorms constitute a real danger to an aeroplane that might be involved in the storm, for they sometimes attain an enormous size. In the British Rainfall Organization's Volume for 1913 is a photograph of hailstones that fell in Essex on May 27 of that year. Although they had partially melted before they were photographed, they are still shown as nearly as large as a hen's egg that was photographed with them for comparison. They fell at Wickham St. Paul's, near Halstead, in Essex. At Great Yeldham there was a fall of similar hailstones. At the latter place the fall lasted only eight minutes, but "the devastation was great," an observer says. "Crops were smitten to the ground, glasshouses all smashed, tarred roof felting cut to ribbons, corrugated iron riddled, tiles and windows smashed in thousands. . . . Man and beast were bruised, and among other animals killed on my own farm I saw rooks, wood pigeons, full-grown hares, partridges, pheasants, rabbits, and various small birds, wild ducks, farmyard fowls, and three cygnets." At Haverhill the stones varied from the size of nutmegs to that of walnuts. At Harston the stones were 1¼ inches in diameter, and at Sheerness ⅝ inch to ⅞ inch. Damage from hail was reported from a wide region in the eastern counties on this day.

Doubtless, it will be said that this was an exceptional occasion, and no doubt it was, but a glance through one of the Rainfall Volumes shows that very heavy falls of hail occur in the summer months in all parts of England. For instance, besides the 24th of the month, heavy falls occurred in May, 1913, on several occasions; on the 10th very heavy hail fell at Bolerno, in Midlothian; on the 26th hailstones over 1 inch in diameter fell at Bulvan, and at Bishops Castle scores of windows were shattered; on the 31st, at Waltham-on-the-Wolds, there was an exceptionally heavy fall of hail.

A glance through the records for any summer month shows that so-called exceptional falls of hail are fairly common, and it scarcely needs pointing out that hailstones far smaller than hens' eggs would have fatal effects on an aeroplane that met them.

Fog

Perhaps fog is one of the worst of the dangers that beset flying, and I should like especially to call attention to fog to those who maintain that at the present time aviators can afford to disregard the weather. The subject of fog, however, has lately been dealt with before this Society by Major Taylor. I may, however, give an example of how a fog may be formed by the mixing of air at different temperatures. On April 3 of this year there was a shower of snow at Farnborough which was followed immediately by bright sunshine; after a few minutes a mist began to form over the aerodrome, and for a short time wreaths of fog covered the Common. No doubt the sun heated the ground and warmed the air in contact with it; the relatively warm air, which would have been fully saturated, was mixed with the cold layer just above—air that had been cooled by the melting snow before the sun came out. The saturated warm air was chilled and its moisture was condensed into fog.

Lightning

It is difficult to say what is the danger to be apprehended from lightning as such. The dangers to flying from thunderstorms are due to the squalls and to the heavy rain and hail that accompany them. It is possible that the actual danger from lightning to an aeroplane flying through a thunderstorm may be no more than that incurred by a pedestrian walking across an open common during a storm. A pilot who was flying above a thundercloud last summer reported that long sparks were given off by his machine at intervals. It is very likely that this happened every time there was a flash of lightning from the cloud below him. But no inconvenience was caused by the sparks. In the case of an airship, however, it would be far otherwise, for quite small sparks might ignite the hydrogen. Lightning is also a danger to kite balloons, owing to the conducting wire. There are several cases on record in which meteorological kites have been struck by lightning, and, as some of these occurred when there was no thunderstorm in progress, it must be remembered that clouds may be highly charged with electricity at times when no actual storm is going on.

There is a particular type of violent thunderstorm in which most of the lightning takes place from cloud to cloud, and when it is almost incessant. It would probably be dangerous for an aeroplane to enter such a cloud, but the appearance of the danger is so obvious that it scarcely needs pointing out.

I hope that what I have said will make it clear that the airman is not entirely immune from the disturbances in the medium in which he flies. If I could persuade aviators in general to take meteorology rather more seriously I should feel that I had not read this paper in vain, but I am afraid that weather maps and forecasts are looked on by many, though not by all, I am glad to think, as mere matters of guesswork, and not worthy of serious consideration. The public in general exhibit a lamentable ignorance of the very elements of meteorology, which is largely due to our educational methods. I do not wish everyone to become a meteorologist, but there is no reason why everyone should not take an intelligent interest in the movements of depressions and anticyclones, and have some faint knowledge of what these terms mean. The English are supposed to talk so much about the weather that it is a pity they should not know what they are talking about, and those who are responsible for the safety of aeroplanes and airships ought to know as much about the weather as, say, a master mariner in the mercantile marine. There are cases where ignorance may be criminal.

Discussion

The Chairman said he thought it was very important that some organization should be set up for transmitting information as to weather conditions from one aerodrome to another. He also expressed the opinion that it was very desirable that there should be further research into the reasons for certain phenomena.

Sir Napier Shaw said that people who fly have much better opportunities to observe the weather conditions than ground observers; and it was to him astonishing that no information had been afforded to the meteorologist from this source, as the airman could find out what is going on in the actual place where the weather is being made and changes are taking place.

The present difficulty was really one of scale; anything that meteorologists could study must be of such a size that it could go on a map covering the whole distance from Asia Minor to Iceland, whereas the dimensions of the phenomena affecting airmen were very small. For these reasons phenomena which chiefly affect the airman are not to be found on meteorologists' maps. An incident of this is afforded by the almost total absence of reports of line squalls from observers, and these were usually located from studying the records of temperature, barometer, etc., afterwards. The scale of even the line squall was not large enough to impress itself upon the observer.

Mr. B. G. Cooper thought that the reason for the lack of assistance afforded to meteorologists by pilots was that a pilot flying on war service was too occupied with his work to pay much attention to meteorological dangers. As line squalls could not be flown round, if there was not an easy height at which they could be surmounted it would seem that they might prove a very serious obstacle, particularly to commercial aviation.

Lecturer's reply—Captain Cave regretted that he was unable to say at what height it would be possible to get above line squalls. A gale frequently extended to a height of five or six miles, and thunderstorms up to the top of the cumulus cloud, which occasionally was at about 24,000 ft. He thought that if gun firing were the cause of up-currents such as had been mentioned, heavy rain would inevitably result, and that the forces causing weather conditions were too gigantic to be affected by such small causes.

Fig. 5. Fully developed cumulo nimbus: the whole top of the main cloud is a mass of false cirrus

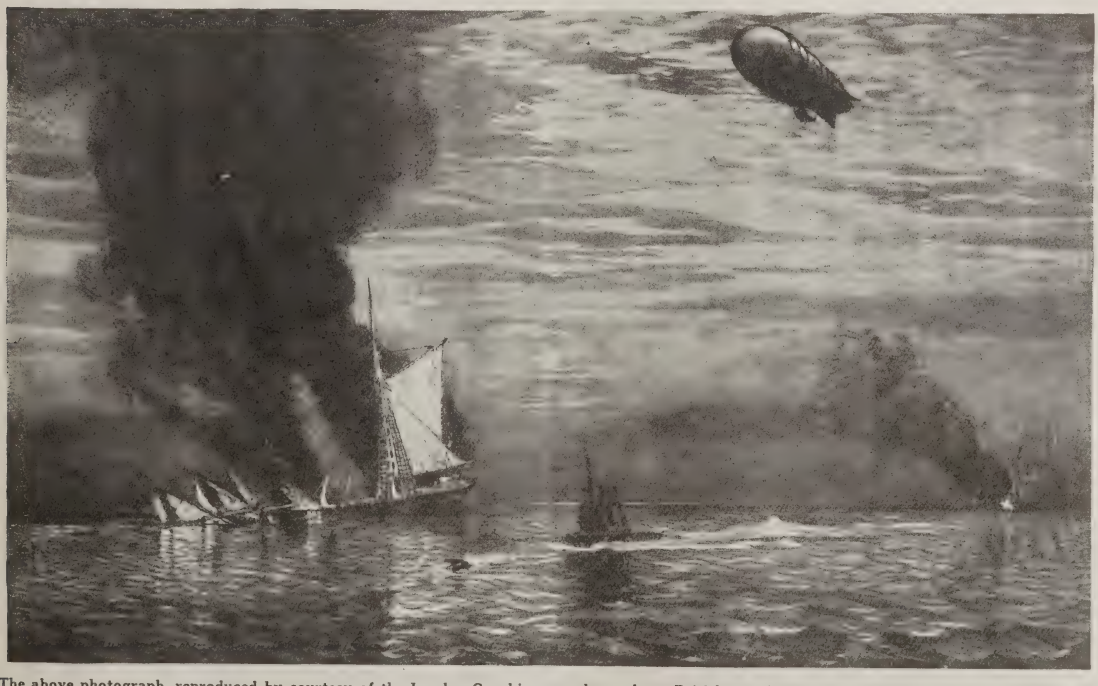
Fig. 6. Fog forming on the aerodrome at Farnborough when a snow shower was followed by bright sunshine

MILITARY AEROSTATICS

By LIEUT. H. K. BLACK, R.F.C., C.F.A.

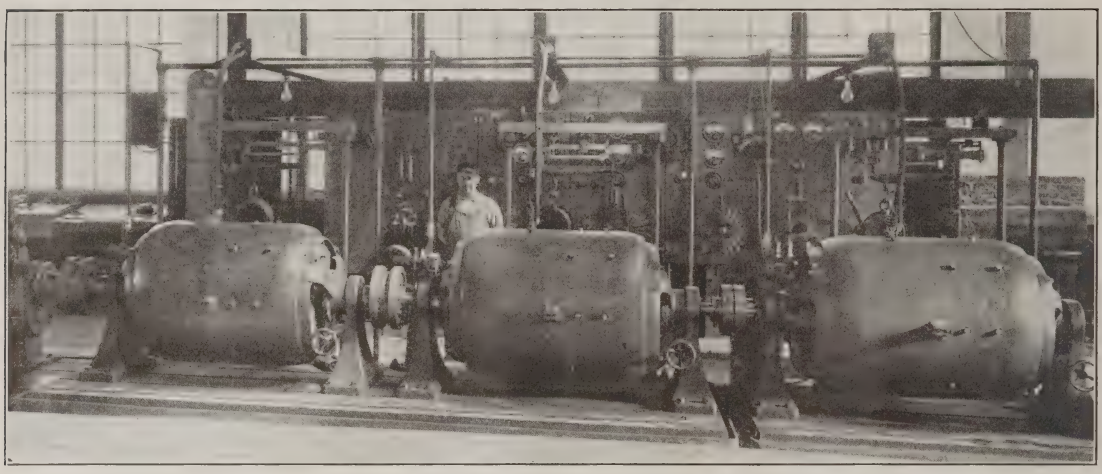
BALLOON WINCHES

THE subject of balloon winches is, to a great extent, a highly technical one, and approximates in a good many respects the subject of motor transport in general. It has this difference, however. While the modern winch is gasoline driven and operates through a system of gears, which are selective by the way, the same as an automobile, it must not only haul the balloon down by the cable but it must also store that cable without straining it in any way. Everyone is familiar with the way a spool of thread is wound. The cable must be wound the same way, except that it must be under no pressure as it winds on the storage drum. It must be tight, yes, but it must not be under any pressure except the natural weight of one layer lying upon the one underneath. To explain further, if a toy balloon was fastened to a spool of cotton and let up and hauled down by turning the spool, the strain, what there was of it, would come directly on the spool. To obviate this happening with the cable and the winch, a means had to be devised whereby the strain of the balloon being hauled down would be taken by something between the cable drum and the balloon. Comparatively recently it was found that by carrying the cable round and between two grooved steel drums, the strain would be taken off the storage drum.



As the storage drum would have to revolve faster to take in the same amount of cable when there was little on it than when it was nearly full, an ingenious contrivance was arranged which caused the storage drum to revolve in direct ratio to the amount of cable there was on it.

There are two brakes to control the outgo of the cable, one of the internal expanding type, which also acts as a lock brake, and the other a band type, which acts directly on the gear drum.



A wheeled piston acting on a compressible spring, to which is attached an indicator, registers the strain on the cable caused by the lift of the gas or the wind pressure on the envelope.

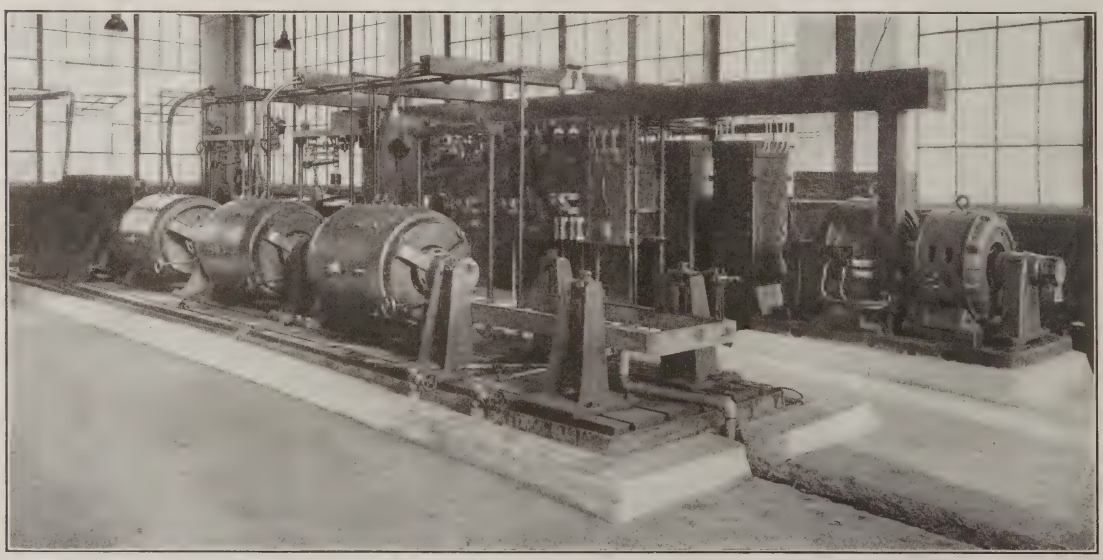
A dial operated by gears gives at all times the amount of cable released. This is adjustable and requires changing as often as the size of the cable is changed. American ingenuity has improved on this idea, and now the modern winch has nothing more or less than a speedometer arrangement, which registers the height of the balloon at any given time, the wind pressure, the strain on the cable, and the total amount of flying that winch has done. The strain is indicated by a hand similar to the speed indicator on a speedometer, the height is registered where the trip mileage would be shown, and the total amount of work done is shown as the season mileage. The trip mileage automatically reduces as the balloon is hauled down. In fact, the whole thing is so complete that one almost expects to find the pilots name and address and what he had for breakfast recorded on the face of this very comprehensive instrument.

As regards the latter, when there is a high wind it might not be impossible—but why go on. You know what Sherman said.

The above photograph, reproduced by courtesy of the London Graphic, was drawn by a British naval officer from his experience, and material supplied by an eye-witness. It depicts a scene which has often happened in the North Sea near the English coast. The German submarine has just managed to reduce the two sailing vessels to burning wrecks when a British Naval dirigible, or Blimp, as it is called, puts in an appearance. From the height a Blimp flies it is very easy to spot a submarine under the surface. A Blimp or, in fact, any lighter than air aerostat, is not admirably designed to do any bomb dropping, as when a bomb is released it acts the same as the release of that much ballast. Though it does not actually destroy many submarines, a Blimp is probably one of the best means for discovering these menaces under the water. Because it has a hydrogen field to sustain it in the air, it can hover over anything that looks suspicious and study it carefully. This is not possible with an aeroplane which relies, for its ability to stay in the air, on its speed. By calling up a destroyer, and then hovering directly over a submarine, conforming to its course, the Blimp can give the destroyer a chance to drop its depth bombs very accurately

THE NEW DUESENBERG AERO ENGINE TEST HOUSE

THE new test house of the Duesenberg Motors Corporation at Elizabeth, N. J., has just been completed. As can be seen in the illustrations, it is a permanent institution designed with a view to affording facilities for the accurate and expeditious testing of a production run of motors. The building, 240 feet x 67 feet, is of substantial steel, faced brick and concrete construction, with monitor roof, and is well lighted and ventilated.



The office and the oil filter room are at the right hand of the broad entrance, and the chemical and physical testing laboratories at the left. These laboratories are equipped with the most modern scientific instruments necessary to analyze and prove material entering into the construction of the motors and are conducted by a specialist in modern analysis methods.

The main test room occupies the center of the building and is 176 feet long and the entire width. There are facilities for testing twenty-two airplane motors at one time. For testing the production run of motors, torque stands are used, each stand being arranged with its own gasoline, oil, and supply and are filled at will by electric driven pumps. The tanks themselves are set up on scales in order that exact fuel consumption by weight may be readily obtained. The feed to the engine is by gravity. The oil tanks are equipped with calibrated sight gauges. While each test stand has its own water tank, the series of tanks for all the stands are connected up in a circulating system operated by an electric driven water pump which drives the excessively hot overflow water from each motor through a gigantic concrete cooling fountain having a diameter of fifty feet and a cooling capacity of 75,000 gallons.

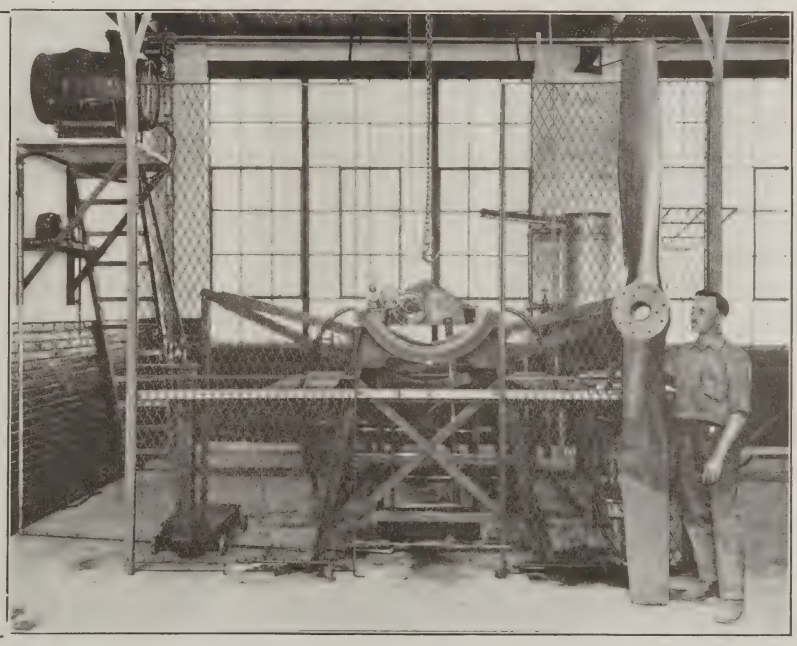
Motors, when completed in the factory, are loaded onto auto trucks and carried to the test house. The truck is backed up to a vacant stand and the motor lifted into place by means of a chain hoist.

An interesting feature is the method of disposing of the exhaust gases from the running motors. The exhaust from each motor is directed into main ducts beneath the floor which lead into one or the other of the two eighty-five-foot stacks shown in the pictures and the gases are carried out by the water tanks. The gasoline tanks are connected up to the main natural draft of these chimneys, which also serve to muffle the noise.

It is apparent that in order to be of value, the test of each motor must be accurately recorded. For this purpose the most

The three 300-400 horsepower Sprague dynamometers used in the Duesenberg aero-engine test house

The gigantic cooling fountain of the Duesenberg aero engine test house. Its diameter is fifty feet, and it has a cooling capacity of 75,000 gallons



accurate equipment obtainable has been installed. Water and oil temperatures are automatically recorded on entering and leaving the motors by delicate recording thermometers. Electric tachometers of the most improved type are installed at each test stand and corrected and calibrated in their permanent locations. Vacuum meters, registering gasoline pumps, oil filters, and many other special devices form the testing equipment.

Beyond the main test room is the dynamometer testing room where the actual horsepower tests are run. Clubs for use on the production run of motors are calibrated on a sample motor hooked up to the dynamometer brakes and, of course, all experimental power tests are run on the dynamometers.

The equipment of the dynamometer room consists of three 300-400 horsepower Sprague machines with maximum speed of 3,500 r.p.m. These machines are set up in concrete in a tandem arrangement and for motors requiring the maximum dynamometer brake are all coupled together, otherwise two or a single machine being used according to the size of the engine to be tested. The switchboard for this outfit is conveniently installed and as these dynamometers are not running continuously enough to make practical use of the current they generate, which is more than enough to operate and light the whole factory, resistance grids have been installed behind the switchboard which are capable of absorbing up to 1,200 horsepower. The engine test stands are set up at either end of the row of dynamometers and the motors are started by the dynamometers acting as motors, the power being commercial A. C. current transformed to D. C. by means of an independent converter outfit.

This outfit is remarkable on account of the great range of power it is capable of handling.

THE LONDON ENEMY AIRCRAFT EXHIBIT

The Fokker Biplane

BY G. DOUGLAS WARDROP

ONE of the most recent acquisitions of the Enemy Aircraft Exhibit in London, is the Fokker biplane of the D VII type, which recording data on one of the wing spars was constructed some time in April, 1918.

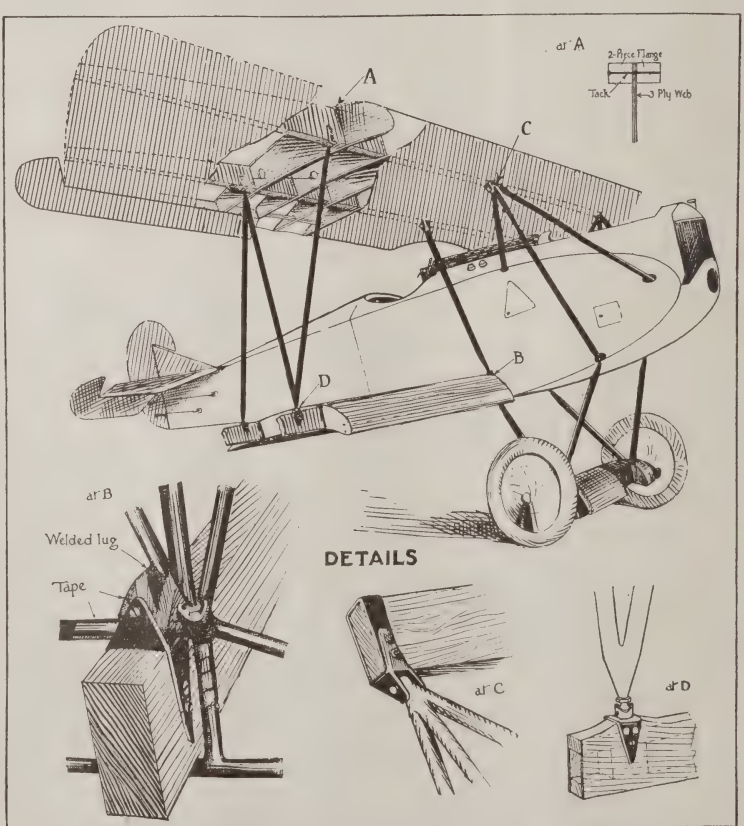
The machine is thus one of the most recent to be exhibited, and is of interest on that account, as well as because of the originality of its design. Except for the fact that it is a biplane, the new Fokker product is very similar to the triplane described in our columns recently. The body construction is the same, and the "wireless" wing design is very similar to that of the Fokker triplane. There is one notable departure, however; the engine fitted has evidently been a stationary water-cooled one, probably a 180 Mercedes.

The body of the Fokker biplane is built throughout of steel tubing, the method of joining the struts and cross members to the corner rails being the same as in the Fokker triplane, and the tubular quadrants serving as an anchorage for the cross-bracing wires being also exactly of the same type as in the previous machine. The wire bracing, as before, is simply doubled over the terminals, and only a single strainer being employed in each double wire. The tail plane and elevator are similar in shape and construction to those of the triplane. The rudder is balanced, as in the triplane, but is preceded by a triangular vertical fin, which has probably been necessitated by the larger water-cooled engine, which gives a deeper body in front. The vertical fin is chiefly remarkable on account of the fact that it has its front attachment slightly off-set to he left, probably to counteract the tendency, caused by the torque, to turn to the left.

The pilot's seat is similar to that of the triplane and is provided with the same wing nuts for quickly adjusting its height to suit individual pilots. In the machine exhibited, the control lever is missing, but from the parts remaining in place it would appear that there has been a forked lever pivoted on a longitudinal rocking shaft, which in turn carried the cranks for the *aileron* control cables, which pass over pulleys in the top plane in the manner illustrated in our description of the triplane.

The engine is mounted on a structure built entirely of steel tubes. The two engine bearers are large diameter tubes, supported from the corner rails by small diameter tubes apparently of very light gauge. The tanks are placed immediately behind the engine, the right-hand compartment of the large main tank carrying the oil, and the left-hand compartment the gasoline. A Vee-type radiator of honeycomb formation is built into the nose of the body, and is provided on the inside with a shutter for adjusting the cooling.

The under carriage is of very similar design to that of the triplane, the axle being enclosed in a wing section of three-ply wood. The shock absorbers are of the spiral spring type, and are covered in by a woven casing. A feature of the Fokker construction, both as exemplified in the triplane and in the present machine, is the large amount of welding employed, and the manner of employing it. After an examination of the biplane, one is apt to come to the conclusion that the designer of the Fokker biplane places implicit faith in his welders, and, we are bound to admit, with very good cause.



With regard to the wings of the Fokker biplane, these have been designed on the "wireless" principle, as in the case of the triplane. There is this difference, however, that whereas in the triplane the two spars were placed so close together as to form a single box, they are quite seperate in the biplane, owing, no doubt, to the great chord, which with its consequent greater travel of the center of pressure, made it necessary to place the spars farther apart than could conveniently be done with the single-box arrangement. Each of the spars is built up of spruce flanges, connected on front and rear faces by three-ply webs, the whole forming a box. Both spars taper in a vertical as well as in a horizontal plane. The spars of upper wing are of uniform width and depth over the portion between the body struts, and taper, from the point of attachment of these struts, to the wing tip, both in front elevation and in plan. The lower wing spars are of uniform section for the width of the body, and hence taper with a straight taper to the tips.. The wing section appears to be similar to, but an enlarged edition of, that employed in the triplane. It is extremely deep compared with any modern standard, about 9½ ins. being the maximum thickness of the top plane. The bottom plane, which is of smaller chord, appears to be a geometrical reduction of the top one, and is of considerably smaller chord. The actual dimensions have not yet been ascertained, as the machine in question is very considerably damaged, but we hope to refer to it in more detail at a later date. As far as can be ascertained at present, the chord of both wings was uniform from root to tip, which fact would appear to indicate that the section from point to point varies from one of very great depth and thickness in the center to one of more orthodox section near the tips.

The wing ribs of the Fokker biplane are somewhat similar to those of the triplane, but a difference was noticed in the construction of the flanges. In the triplane the thin three-ply web was accommodated in a narrow groove in the top and bottom flanges, but so narrow was the web that quite 50 per cent of the tacks missed the web altogether and simply served to weaken the flanges. In the biplane it is not, therefore, surprising to find that an attempt has been made to eliminate this defect. This attempt has taken the form of the employment of a two-piece flange instead of the old grooved one-piece flange. Instead of vertical tacks the two halves of the two-piece flanges are held together and to the thin web by transverse tacks driven through alternately from right and left, and riveted over.

The manner of supporting the top plane is somewhat different from the method employed in the triplane. No wire bracing whatever is used, the necessary transverse rigidity being provided by the arrangement of the body struts. Sloping outward from the body is a system of struts, all stream line steel tubes. One strut runs from the lower corner rail of the body to the rear spar. A set of three struts unite in a welded joint secured to the top spar by a single bolt. Each of these three struts is welded to a portion of the body, so that when the top plane is removed, a pyramid of steel tubes remain in place on the body, sloping upwards and outwards from the sides. The front one of these struts is welded to the tubular engine bearer, projecting through an opening in the metal body covering. The middle strut is welded to the bottom corner rail at the point where is attached the front strut of the undercarriage, and the third strut is also welded to the bottom corner rail, or, more correctly speaking, to a rail running above the spars of the lower wing, at the point where it is crossed by the front spar. The upper front spar is thus rigidly secured, whereas provision has been made for an adjustment of the angle of incidence by fitting into the end of the strut running from the rear spar to the lower body rail a threaded eye bolt fitting into a socket on the lower rail. Incidentally it might be mentioned in this connection that the upper plane is marked "Anstellwinkel 0°" (angle of incidence 0°.) Whether or not the bottom plane is also set at no angle of incidence we have not yet been able to ascertain. The mounting of the bottom plane is slightly different to that of the bottom plane of the triplane. In the latter provision was made for a slight adjustment of the angle of incidence, but in the biplane no such arrangement is to be found, the spars being rigidly attached to the body corner rails.

Only one pair of inter-plane struts connect the upper and lower wings on each side. These are in the form of an N, the joints between the members being welded. The joints between the legs of the N and the wing spars are in the form of ball and socket joints, those for the front top spar and rear bottom spar being fixed, while threaded bolts screwed into the end of the struts meeting the upper rear and lower front spars provide means for adjusting the incidence. No lift or landing wires are fitted, the deep spars being relied upon to resist the bend-

(*Continued on page 87*)

In the Fokker captured the wings have been somewhat badly damaged, and it has not, therefore, been possible to represent exactly the shape of the wing tips. The upper plane has probably been approximately as shown in the drawing, but of the lower wing sufficient did not remain intact from which to reconstruct the shape of the tip. The unusual strutting of the top plane should be noticed. Inset are some constructional details

Aero Mail Service in August Without Mishap of Any Kind

The Post Office Department issues the following:

During the month of August the Aero Mail Service between Washington, Philadelphia, and New York was conducted without a miss, hitch, or serious delay of any character.

The operations for the month were perhaps the most remarkable in the history of aviation. There were 27 flying days, of which 108 legs of the journey had to be performed, and in that month there were but two forced landings, one with a delay of 7 minutes and the other with a delay of less than 10 minutes. One forced landing was made within 4 miles of Belmont Park at the end of a journey. It was caused by the break of a magneto shaft. The other forced landing was made on a flight where fog and haze obscured the ground, and for the purpose of picking up the course, because the compass failed to work.

The total possible miles of flight was 11,961, of which 11,957 miles were completed.

During the first 10 days of the month the routes were flown by Lieuts. Edgerton, Kilgore, Bonsal, Webb, Culver, and Miller without a miss, hitch, or forced landing. During the last 20 days of the month the civilian aviators of the Post Office Department operated the routes. The perfect scores were made by Aviators Max Miller and E. V. Gardner. Aviators Maurice Newton and Robert Shank, on the Philadelphia end of the route, each had one forced landing, giving them a score of 99 per cent.

A total of 5,679 pounds of mail was carried on the trips.

A most rigid mechanical maintenance system on all fields was maintained, with the result that the month closed without a single plane of the 15 being laid up in the shop for repairs.

Aero Mail Carrier Sets New Records

D. C. De Hart, a California aviator who recently joined the staff of the aerial mail service, made two records in his flight from Washington to Belmont Park on September 16.

He left the capital at 11:40 A.M. with 210 pounds of mail and arrived at Bustleton Station, Philadelphia, at 1:03 P.M., or 1 hour and 23 minutes for this leg of the route.

Leaving Philadelphia at 1:11 P.M., he landed in Belmont Park field at precisely 2 o'clock, 49 minutes for the ninety miles of this part of the trip and 2 hours and 12 minutes flying time for the through trip from Washington.

This is the best through time yet made by any flier, civilian or army, and the time between Washington and Philadelphia, 1 hour and 23 minutes, was also the fastest yet, making two records to De Hart's credit.

His time of 49 minutes from the Quaker City has been beaten in a Liberty motor, 42 minutes being the record. De Hart flew with one of the smaller Curtiss planes.

Fast Flight with Aero Mail

One of the best flights made since civilian aviators took over the carrying of the mail was made Sept. 13th by Maurice Newton, who came through from Washington with 135 pounds of mail, arriving at Belmont Park at 2:05 P. M. The mail reached many New York business houses soon afterward.

Newton left Washington at 11:42 A. M. and arrived in Philadelphia at 1:10 P. M., stopping there only five minutes. His elapsed time for the through trip was two hours and 18 minutes.

Robert Shank took the mail south. It is expected that the next flight to Chicago will not take place for two weeks, but preparations are being made for extension of the facilities of the terminal at Belmont Park, with complete equipment to insure the success of the new aero line when a regular schedule is undertaken.

Want Aero Mail Station in Newark

Frederick W. Egner, as chairman of the Board of Trade Committee which will endeavor to induce the postal authorities to accept a Newark site as an aerial mail delivery landing station and distributing point, has called a meeting of the committee for September 18th at 12:15 o'clock at the Downtown Club. Postmaster John F. Sinnott has received an invitation to attend the luncheon and meeting to present his views anent Newark as an aerial mail center.

As has been announced in the Sunday Call, the site which is being considered favorably by the postal authorities in Washington is the Heller tract of fifty acres in the northernmost part of the Forest Hill section of this city.

It is possible that as a result of the meeting a committee will be appointed to visit the postal authorities in Washington and present Newark's qualifications as an ideal location for an aerial mail station. Paul E. Heller, one of the members of the committee and an owner of the land, stated that inasmuch as the postal authorities say they have no funds to purchase land for this purpose has offered the department the use of the land for the duration of the war.

Note.—Depreciation is not estimated in this report, for lack of convincing data, but is reflected in the items under repairs, parts and labor. Items for rent, light, power, etc.; misc.; dead time of pilots; time of hangar men, misc.; shop time of mechanics; interest on investment; and departmental overhead charges; all of which are not directly apportionable to individual ships, are pro-rated equally between all of the ships.

THE DE HAVILAND V. SINGLE SEATER

THIS modern British aircraft has now to be dealt with in the standard German description, the following being a description from the technical German aero paper, *Zeitschrift für Flugtechnich und Motorluftschiffhart* (*Journal of Aviation and Aerodynamics*), reading to the following effect:

The aeroplane in question was manufactured by the Darracq Motor Engineering Company, Ltd., in London, and carries the recognition mark: A9435.

It is a single-pair-strutted biplane, the upper planes of which are staggered 0.695 metre backwards.

Both planes have a span of 7.84 by a chord of 1.375 m. The upper planes are mounted to a canopy (center-section), the lower ones to rudimentary pieces at the height of the bottom body longtitudinals.

The V-position (dihedral) of the planes amounts to 172 deg.; there is no arrow shape.

The angle of incidence of the upper plane is 2 deg. by the centre section, 2½ deg. at the end, that of the lower plane 2½ deg. over all.

The spruce spars have I-shaped section.

The distance between the ribs amounts to 280-350 millimetres. Between each two ribs on the suction side, two further auxiliary ribs are arranged from the leading edge rib to the main spar. The struts are made solid of spruce.

Load sustaining and opposed cables re made of profile wire in single arrangement.

Ailerons are attached to all four planes at the back spar. Their governing wires run outside the planes, below in front of the leading edge rib, above over the front spar. The corresponding ailerons are connected by profile wires.

The normal wire cum wood body fuselage, with four longtitudinals, is strengthened in front till behind the pilot's seat, and behind below the fixed tail-plane by the planking of plywood of 3 mm. thickness.

By the mounting of fairings the body attains in front almost circular shape from the pilot's seat.

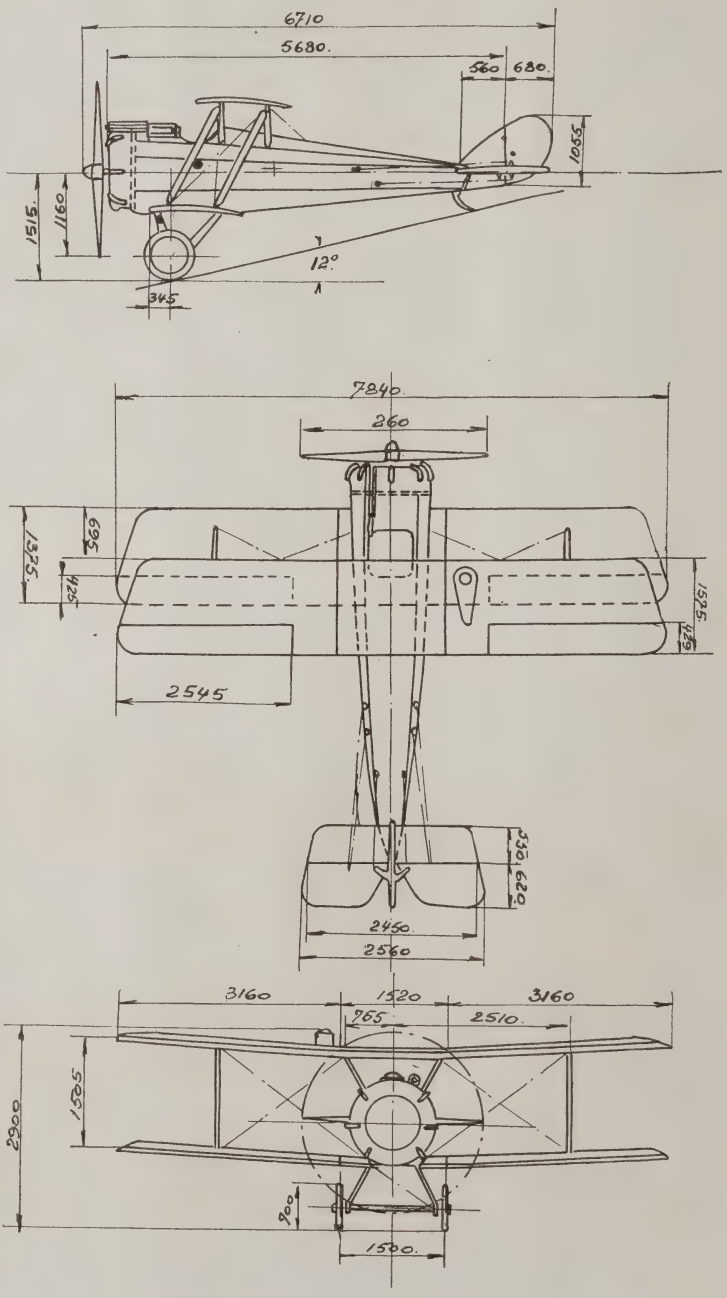
The fuselage is covered with canvas.

The solid wooden non-covered landing gear struts are of streamline section. The through running axle rests between two auxiliary streamlined covered ones. There is no limit of the spring effect range.

The through-running tail plane rests fixed on the body-end with an angle of incidence of 1 deg. without the hitherto usual angle of incidence change arrngement.

Each part of the divided elevator is provided with levers with single governing cables.

The engine is a 110 Le Rhône rotary, which has given 130 h.p. by earlier tests.



The main petrol tank of a capacity of 100 litres and the oil tank of a capacity of 21 litres are mounted behind the pilot. Further, a gravity tank of 26 litres' capacity is placed on the right upper plane.

The petrol supply from the main tank takes place by means of compressed air, produced by a small propeller air-pump, fixed on the left landing gear strut. The petrol store suffices for a flight of about 2 hours' duration.

In the pilot's seat are arranged the instruments. To the right of the pilot: The two petrol-supplying tubes with stop cocks; the change arrangement for a spring relief of the elevator management. In the middle: Tachometer, speedometer, altimeter, contact-breaker, watch and compass. To left: Gas and petrol regulation hand air-pump.

Two further aeroplanes of the same type, which were manufactured by the Aircraft Manufacturing Co., Ltd., in London, show a considerably more convenient arrangement of the instruments, and are further provided with electric light for night flying.

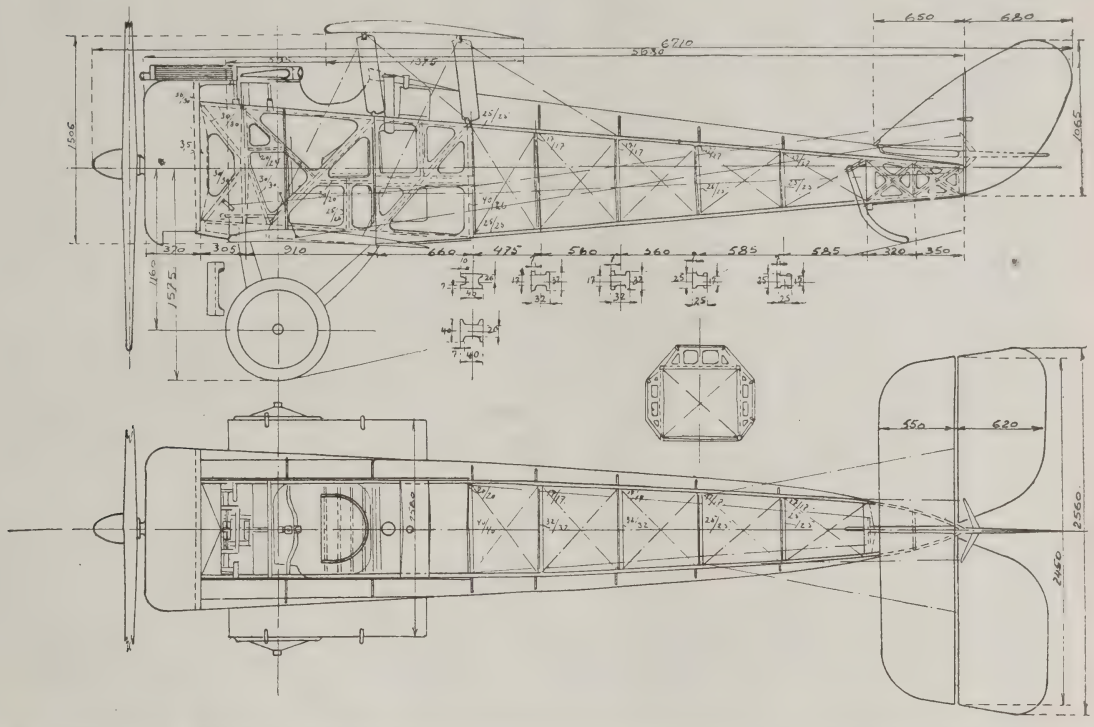
The aeroplane is armed with a fixed machine-gun of the Maxim type (usual army model with the up-placketed jacket)

mounted on the top of the cockpit to the left side of the pilot's seat. There is hydraulic control and release by means of Bowden wire. From remains found in the fuselage it could be ascertained that the cartridge belt is a metal one. The belt-box lies below the machine-gun direct behind the motor.

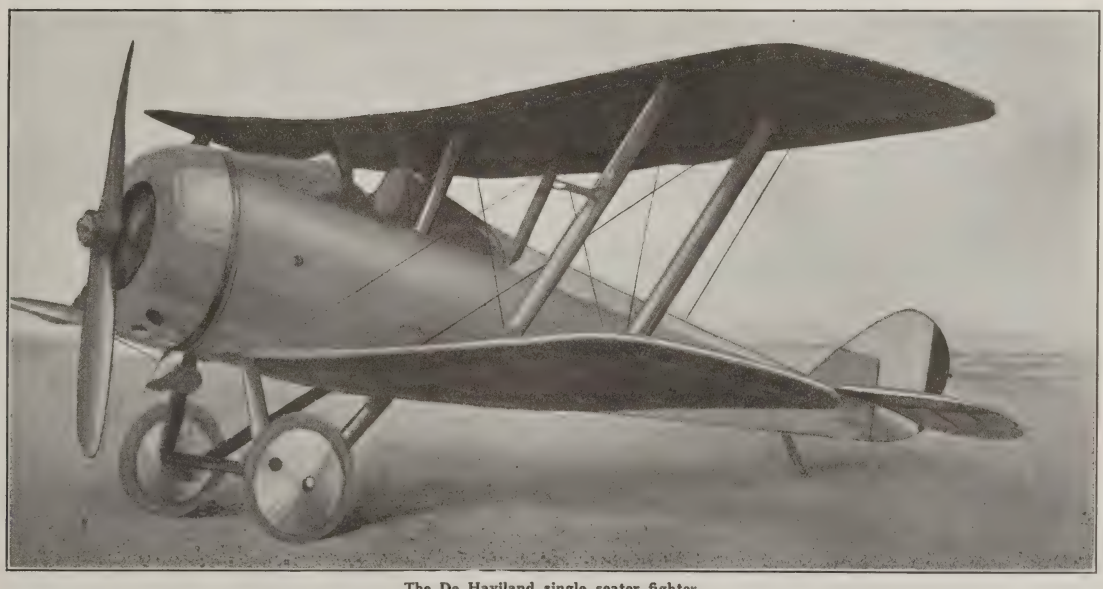
The empty weight of the aeroplane worked out at 461 kilos.

The weight of the fuel, with fully loaded tanks, amounts to 108 kg.

Setting 125 kg. aside for pilot and armament, the useful load amounts to 233 kg., and the total weight works out at 694 kg.



With a surface area of 20.14 square metres the load is thus 34.4 kg. per sq. m.



The performance load amounts to

$$\frac{964}{130} = 5.33 \text{ kg. h.p.}$$

Owing to the staggered position of the planes and the moving of the tanks behind the pilot, his seat has advanced much forward, there being thus a good sight forwards and upwards.

From this arrangement there arise aerodynamically no drawbacks for the longtitudinal stability. Yet the enlargement of the angle of incidence of the upper planes towards the ends should have a bad influence on the lateral stability.—*The London Aeroplane.*

JMA—Rated as Junior Military Aviator.
JRC—Report to Jackson Field, Riverside, Cal.
KST—Report to Kelly Field, So. San Antonio, Tex. (When specified in the order, the number of the field is given in parentheses)
LDT—Report to Love Field, Dallas, Tex.
LHV—Report to Langley Field, Hampton, Va.
MAC—Report to March Field, Allesandro, Cal.
MAJ—Commissioned as Major, Aviation Section, Signal Corps.
MAT—Report to Mather Field, Sacramento, Cal.
MDO—Report to McCook Field, Dayton, Ohio.
MIT—Report to School of Military Aeronautics, Massachusetts Institute of Technology, Boston, Mass.
MJA—Commissioned as Major Air Service, National Army.
MJR—Commissioned as Major, Aviation Section, Signal Reserve Corps.
MSC—Report to Radio School, Maryland State Agricultural College, College Park, Md.
OBS—Attached to the Aeronautical Service as Observers.
OSU—Report to School of Military Aeronautics, Ohio State University, Columbus, Ohio.
PFO—Report to Post Field, Fort Sill, Okla.
PMT—Report to Park Field, Millington, Tenn.
PUP—Report to School of Military Aeronautics, Princeton University, Princeton, N. J.
PWM—Report to Payne Field, West Point, Miss.
REL—Relieved from present duty.
RSD—Report to Rockwell Field, San Diego, Cal.
RTR—Retransferred to organization attached to previous assignment to aviation duty.
RWT—Report to Rich Field, Waco, Tex.
SBI—Report to Scott Field, Belleville, Ill.
SAG—Report to Souther Field, Americus, Ga.
SGS—Report to Camp Sevier, Greenville, S. C.
SLA—Commissioned as Second Lieutenant Air Service, National Army.
SLR—Commissioned as Second Lieutenant, Aviation Section, Signal Reserve Corps.
SLT—Commissioned as Second Lieutenant, Aviation Section, Signal Corps.
SMM—Report to Selfridge Field, Mount Clemens, Mich.
SRC—Report to Columbia School for Radio Officers, New York City.
TFT—Report to Taliaferro Field, Fort Worth, Texas. (When specified in the order, the number of the field is given in parentheses)
TMA—Report to Taylor Field, Montgomery, Ala.
UCB—Report to School of Military Aeronautics, University of California, Berkeley, Cal.
UIU—Report to School of Military Aeronautics, University of Illinois, Urbana, Ill.
UTA—Report to School of Military Aeronautics, University of Texas, Austin, Tex.
VBW—Report to Vancouver Barracks, Washington.
WAC—Report to Aviation Concentration Camp, Waco, Tex.
WCS—Wire to the Chief Signal Officer upon arrival.
WDM—Wire, Director of Military Aeronautics, upon arrival.
WFO—Report to Wilbur Wright Field, Fairfield, Ohio.

Notes

Note 1—Report in order named to places mentioned for temporary duty.
Note 2—Report of Aviation Gen., Supply Depot, Los Angeles, Cal.
Note 3—Report to Standard Aircraft Corp., Elizabeth, N. J.

Japanese seaplanes flying round a battle cruiser at manoeuvres

(*Continued on page* 83)

FOREIGN NEWS

GREAT BRITAIN

"On the morning of September 2 our squadrons attacked the hostile aerodrome at Buehl with very good results. Excellent shooting was obtained. Many direct hits were observed on the hangars, and a hostile machine on the ground was destroyed. All four machines returned safely."

The British independent air force within twenty-four hours has dropped fifteen tons of bombs on German military works in the Rhine provinces.

Three raids were made on the German aerodrome at Buehl. Three hangars were demolished and direct hits were obtained on many others.

The railways at Ehrang, four miles northeast of Treves, were attacked from a height of 900 feet and every bomb scored a direct hit.

At Saarbrucken, forty miles southeast of Treves, the Burbach works and railways were bombed.

In addition to the attacks already reported on the hostile aerodrome at Buehl on the morning of September 2, our squadrons on the afternoon of that day again attacked the same objective. Very good results were obtained. More hangars were hit and a fire was started. All our machines returned safely.

On the night of September 2-3 our squadrons dropped a total of seventeen tons of bombs. The Buehl aerodrome was again heavily attacked and the following targets bombed: The Burbach works and the railways at Saarbrucken and Ehrang and the Boulay aerodrome. Several fires were started. At Buehl three hangars were demolished and direct hits were obtained on many others. The attack was carried out at an altitude from 300 to 900 feet. More than fifteen tons of bombs were dropped on this aerodrome in twenty-four hours.

The railways at Ehrang were attacked from a height of 900 feet and every bomb obtained a direct hit. A fire was started in the Burbach works (Saarbrucken) and very good bursts were observed. All our machines returned safely.

American and British airmen in a raid on the German aerodrome at Vassenaere, Belgium, have caused great damage. A gasoline and oil dump was set on fire, and this in turn ignited an ammunition dump and also six Fokker biplanes. Two other machines were destroyed by direct hits by bombs, and a large Gotha hangar was completely burned.

The pilot of a British two-seater was attacked by seven hostile machines. The enemy fired explosive bullets and the pilot was hit five times in the left leg. Although his leg was almost severed, he succeeded in landing his machine behind the British lines.

Of the work of the airmen in the battle zone an official communication says:

"On September 2 our aeroplanes worked all day in front of the advancing battle line, behind which our observation balloons followed closely. Our airmen were frequently attacked by large formations of hostile machines, but persisted in their various tasks.

"The targets offered by the retiring Germans were reported to our artillery and contact with our infantry and tanks was maintained. Concentration of hostile troops and transport along the road were engaged with bombs and machine guns, hostile anti-tank guns were silenced, and supplies of small arms ammunition were dropped to our infantry in the forward zone.

"Many aerial encounters took place. We destroyed ten German machines and drove two down out of control. Our missing machines amounted to twenty.

"Twenty-four tons of bombs were dropped during the day and the night following."

An official communication issued by the Air Ministry on September 4 says:

"On the afternoon of the 3d inst. our squadrons carried out a most successful attack on the hostile aerodrome at Morhange. Several hangars received direct hits and two hostile machines on the ground were blown up. The extent of the damage is confirmed by photographs. All our machines returned safely.

"On the night of the 3d-4th inst. our squadrons again heavily bombed the aerodrome at Morhange. Several more hangars were hit, and some fires were started. The hostile aerodrome at Boulay and the blast furnaces at Esch, southwest of Luxemburg, were also attacked. Direct hits were obtained on the blast furnaces and fires were started at Boulay. All our machines returned safely.

"On the morning of the 4th inst. our squadrons attacked the aero drome at Morhange, this being the third attack within twenty-four hours. Excellent shooting was again made, and seven hangars received direct hits. All the bombs were seen to burst well.

"One squadron attacked the Buehl aerodrome with very good results. All our machines returned safely."

The aerial operations referred to by the Air Ministry were carried out by the British Independent Air Force.

Constantinople was bombarded twice, the latter part of August, the Admiralty announced. The arsenal, the dockyard, the Turkish War Office, the aerodrome at Galata, the seaplane base at Gallipoli, and Chanak were attacked.

The raids, which were carried out by the Royal Air Force, occurred on the nights of August 25-26 and 27-28.

On August 26 and September 1 the Royal Air Force, co-operating with the navy, carried out successful bombing raids on Ostend and Zeebrugge, on the Belgian coast. Thirteen tons of bombs were dropped and large fires were started, the statement announces.

A total of 465 enemy aeroplanes has been destroyed and 200 disabled since the commencement of the offensive on August 8, according to an official statement on aerial operations issued September 5. Sixty-one hostile balloons were destroyed and 911 tons of bombs were dropped on targets.

One hundred and sixteen British machines are missing.

British air supremacy on the western front during the last month was emphasized in a statement made by the British Bureau of Information.

Two features of the recent fighting, it was pointed out, were "the remarkably high number of enemy machines destroyed week by week and the singularly spasmodic and nervous way in which Germany seeks to counteract the threefold aerial offensive against her."

The "bags" by the British on the western front alone for the week ending August 27, it was said, were 70 enemy machines destroyed and 11 driven down to earth, as compared with 27 British machines reported missing during the same period—a ratio of more than two to one.

Successful results by the British airmen were reported also on the Italian, Balkan and Palestine fronts, where 18 enemy machines were smashed during the week ended August 27, while only 12 British aviators were reported missing. On all of the European Mediterranean battlefields in the month in question the British, it was stated, accounted for approximately 120 enemy aircraft, against a net loss of 29 of their own machines.

The disparity on the western front is all the more noticeable, the report continues, because it is there that Germany is concentrating her strength. British airmen, during the week referred to, made thirty-six raids into Germany, in addition to innumerable bombing incursions on vital enemy positions behind the German lines and intense local engagements.

The dogged persistency of British and other allied airmen is said to bewilder the Germans. This week at Mannheim, where, owing to numerical superiority, and after "bitter fighting," an early morning raid resulted in the loss of seven British machines, the Britons on the evening of the same day renewed the attack and, in spite of even greater resistance, dropped double the number of bombs, all the machines returning safely.

Five important cities in Germany and five hostile airdromes were heavily bombarded by British aerial squadrons on the night of Aug. 21-22, according to an official statement issued Sept. 5 by the British Air Ministry.

The text of the statement reads:

In spite of the enemy's most determined efforts for protection, consisting of a large number of anti-aircraft guns, between the hours of 8 P. M. on the 21st, and 10 A. M. on the 22d inst., five important towns in Germany were heavily attacked as well as five hostile aerodromes.

FRANCE

The official statement of September 2 on aviation reads:

"Bad weather interfered with the aerial operations on September 1. Nevertheless, four enemy aeroplanes were brought down and one captive balloon was set afire.

"Our patrol machines carried out bombardments in the region of La Fere, convoys on the roads radiating around St. Quentin and La Fere were subjected to machine gun fire. During the night nearly eleven tons of bombs were dropped on the railway stations at Marle, Laon and Ham, causing fires. Eight tons of projectiles were dropped on bivouacs in the neighborhood of Villers-Franqueux, and on stations at Maison Bleue and Guignicourt. Four and a half tons of projectiles were dropped on the latter place, causing heavy damage."

On September 2 our aviators were particularly active along the whole front. They did important work. Our observers increased their reconnoissances over the enemy lines. They took about one hundred photographs of the battle zone. Our infantry airmen chronicled the advance of our troops, reported on the enemy batteries in action, and in liaison with the artillery co-operated in the destruction of enemy centres of resistance.

"Numerous engagements were fought, in the course of which nineteen enemy planes were brought down or put out of action, and nine captive balloons were burned.

"Our bombing planes dropped more than thirteen tons of bombs in the region of Chavignon, Ainzy and Brancourt. During the night our bombing machines continued their work. Sixteen tons of projectiles were dropped on stations, bivouacs and railways behind the enemy front. The station at Flavy-le-Martel received six tons, and two violent fires broke out. Three tons were dropped on cantonments in the region of Jussy, and four tons on the stations at Guignicourt and Maison Bleue, giving excellent results. Our bombing machines also used several thousand cartridges against enemy bivouacs."

"On September 4 our aerial squadrons took an important part in the battle. Our planes, flying at a low altitude, used their machine guns on convoys and troops withdrawing each of the Canal du Nord, especially in the region of Flavy-le-Martel, Jussy, Bois l'Abbé, Cailloulet and Mennessis. Thousands of cartridges also were fired at the enemy retreating north of the Vesle and on bivouacs and cantonments on the north bank of the Aisne.

"Our squadrons fought numerous engagements over the German lines. Fifteen enemy machines were brought down or put out of action, and four captive balloons were burned."

Nearly forty tons of explosives were dropped by 148 Entente Allied aeroplanes on the towns of Brancourt and Anizy-le-Chateau, south of Coucy Forest, August 29, in connection with the advance of General Mangin's army, says the *Matin*. Important material damage was done.

In the course of the aerial operations fifteen fights took place. Six enemy aeroplanes were shot down. Only one Allied machine was lost.

During the month of August French bombardment aeroplanes dropped more than 629 tons of projectiles, according to a statement issued Sept. 11 by the war office. The statement says:

"In the course of August our bombardment aeroplanes in day flights dropped more than 269 tons of projectiles on objectives on the battlefield between the Somme and the Aisne. In night attacks our bombing aeroplanes dropped 360 tons of projectiles on railway stations and enemy roads of communication.

"In the same month 280 enemy machines were downed or seen falling out of control, and sixty-six enemy balloons were set on fire."

GERMANY

The report for Sept. 6th follows: Our battle airmen succesfully attacked enemy columns during their crossing of the Somme, near Brie and St. Christ.

Five aeroplanes were brought down out of a British squadron which advanced to the attack.

During August 565 enemy aeroplanes were brought down on the German fronts, 62 of them by our anti-aircraft guns. Captive balloons to the number of 52 also were brought down. Of the total number, 251 airplanes are in our possession. The remainder were observed to fall on the other side of the enemy lines. We lost in battle 153 aeroplanes and 86 captive balloons.

MODEL NEWS

Edited by John F. McMahon

Model Aeroplane Building as a Step to Aeronautical Engineering

Steam Engine Construction

THE steam engine and the compressed air motor are alike in principle, the only difference is the compressed air motor is acted on by the air forced into the tank and compressed to a certain pressure, while the steam engine is worked by the steam pressure from the boiler. This steam pressure is generated from water heated to a high degree. You have perhaps noticed a kettle boiling on the stove, and the cover jumping up and down from the pressure generated inside. If you were to seal up the spout so that no steam could escape in that direction, the cover would be forced off by the pressure.

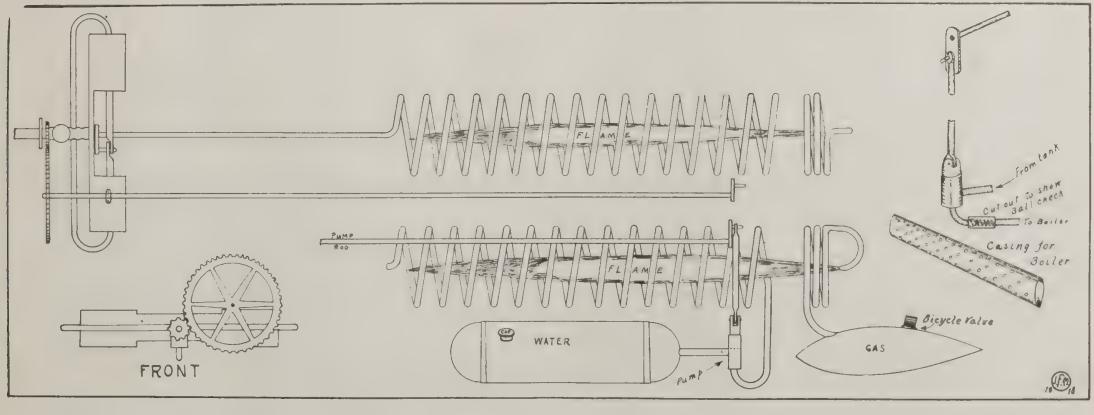
The boiler of the motor about to be described is known as the flash type, and is made of a coil of tubing through which a jet of flame from a sort of Bunsen burner is projected.

Upon referring to the accompanying drawing it will be noticed that the engine is of the same form and shape as the compressed air motor described previously. The cylinders, valves, and crankshaft are of the same construction, but the piston is minus the leather cup washer for the simple reason that the heat of the steam would burn it up. If possible it would be a good idea to have two pistons turned out of aluminum by some machinist. The pistons would then be of correct size and therefore no loss of pressure would result. The lubricant should be of the heavy steam engine cylinder oil used in large engines.

The soldering of this engine will be harder than the compressed air motor because of the use of silver strip solder such as jewelers use, instead of soft lead solder, we used in the other engine.

The reason for this, is, the intense heat, which would tend to melt the lead. The model builder must remember that it requires a great deal of heat to melt the silver solder and it is possible that the parts to be joined might melt also, so I would advise the builder to be careful. Again care must be taken, not to let the solder run into the pipes or valve openings.

The flash boiler is made of a twelve-foot piece 3/16″ outside diameter steel or seamless copper tubing, preferably the steel on account of its higher tensile strength. This tubing is then bent on a wooden former 1-1/2″ diameter, taking care not to get any kinks in the coil or the boiler will not work well. One end of the coil is soldered to the engine, the other being fastened to the water pump. The water tank is made of thin sheet metal, the two ends are made from small curtain rod balls 1-1/4″ diameter. The tank should be made large enough to hold three ounces of water. The pump is made from a piece of 1/4″ inside diameter tubing, with a piece of drill rod as the piston. This drill rod must be just tight enough to allow for a working fit. When constructing the pump make sure that the piston is above the pipe leading from the tank when it is at its highest point or top center. The stroke of the piston is 1/2″. When the steam is "up" in the boiler it will have a tendency to force the water back into the tank. In order to overcome this tendency, we must put a check between the boiler and the pump. By glancing at the sketch of the pump arrangement you will see how the check valve is constructed. A ball bearing held in place by a spring. This check is pushed back when the pump forces the water through the valve but it jumps back immediately when the pumping action stops on account of the joint action of the spring and the pressure of the steam.



The pump is operated by a crankshaft running from the large gear at the front of the engine and connected to a crank throw at the rear. This crank throw is constructed so as to allow for a half-inch stroke. The large gear is driven by a smaller gear one-fifth the size, fastened to the crankshaft. This arrangement allows the engine to make five revolutions to each stroke of the pump.

The Bunsen burner is made of tubing the same as the boiler. The ounce of gas is held in a receptacle made to a convenient steamline shape with a bicycle valve soldered in it to allow pressure by means of a foot pump and also for filling with gas. To fill up the tank unscrew the inside of the valve. The tubing is then soldered to the tank, making two or three circles, and then shoots down so as to bring the nozzle in the centre. This arrangement allows the flame to pass between the coils of gas tubing, thereby vaporizing the gas quickly.

The gas tank should have a pressure of five pounds in order to keep the gas blowing with enough pressure to allow the flame to shoot to the ends of the coils. The tubing that forms the nozzle of the Bunsen burner should be hammered to a point and a small hole drilled in same. This hole can be enlarged often experimenting to find out the proper size hole.

A steam plant is a very tricky combination to handle and is very powerful, so I would advise testing the engine fully before putting in a model.

To keep the heat in the boiler it is advisable to put a casing around it of thin sheet metal, having ventilator holes drilled or punched in it. If procurable I would advise inserting a sheet of very thin asbestos paper between the coils of the boiler and the casing. This will assist in holding the heat inside.

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

His Northern Brother

Just make it two, old fellow;
I want to stand once more
Beneath the old flag with you,
As in the days of yore;
Our fathers stood together
And fought on land and sea,
The battles fierce that made us
A nation of the free.

I whipped you down at Vicksburg,
You licked me at Bull Run,
On many a field we struggled
When neither victory won,
You wore the gray of Southland,
I wore the Northern blue;
Like men we did our duty,
When screaming bullets flew.

Four years we fought like heroes
But when the war was done
Our hands met in friendly clasp.
Our two hearts beat as one,
And now, when danger threatens
No North, no South, we know,
Once more we stand together
To fight the common foe.

My head, like yours, is frosty—
Old age is creeping on;
Life's sun is lower sinking,
My day will soon be gone.
But if our country's honor
Needs once again her son,
I'm ready, too, old fellow—
So get another gun.—*Minneapolis Journal.*

STICK CONTROL

The Fable of the Funny Wop

By Lynn

Once upon a time there was an Italian with an East Side accent that joined the army. He was a chauffeur. In the army he was a cook in the Air Service. Failing in a last futile attempt to create a spagetti dish out of camouflaged corn-willie, he was given a job as orderly. It was his nature to ask questions. This was irksome to the various non-coms that wield the destiny of thousands of memorandums. It became necessary that action be taken. The Wop, which wasn't his name at all, was given instructions to find anti-slip grips, climb the 100-foot tower, and rescue the barometer for the records of the delinquency clerk.

After forty-four bucks were passed as to the whereabouts of the anti-slip grips, the Wop gave it up and climbed the tower without them. His trip was one of hazards, but that was a matter of small importance.

The Wop was obeying the orders of silly non-com petents.

From the tower he brought back to his non-coms two sledge hammers, one bird nest and four vin rouge bottles. The barometer was not there.

Moral: The Wop was a soldier, a gentleman and perhaps a good judge of—Soda Pop, and he obeyed orders whether they came from a brain of emptiness or a regular guy. And the point is this: Don't kid a bird with a foreign accent—he may be a better soldier than you. Remember the old proverb about junking rocks at the lady of easy virtue. You don't remember seeing any boulders floating around permiscously, do you.

Fire, Fire, Fire

(With apologies to Tennyson)

Fire, Fire, Fire,
At the cold grey stars, Oh Guns
And I'm glad that my tongue can utter
The thoughts that I think of the Huns.

'Tis well for the shining moon
That she sits in the heavens at rest;
'Tis well for the cold, bright stars
That are watching the guns do their best.

But the buzzing Zepp goes on
To its cultured German lair;
And Oh, the comfort of being in bed,
For I'm tired of the cellar stair.

Fire, Fire, Fire,
At the cold grey stars, Oh Guns.
For the tender thought of a sleep that is lost
I will *never* forgive the Huns.

Of Different Degrees

There are four kinds of lies. There is the ordinary plain, every-day lie. There is what may be called, and frequently is called, the d—d lie. There are statistics, AND the German Wireless.

I Should Say Not

The cadet was filling out an application for a furlough.

He was mildly surprised when he read the question:

"Is there not someone at or near your place of residence who can act as substitute for you?"

The cadet approached the busy clerk and asked: "How must I answer this question?"

The clerk was used to that. "Simply make a correct statement," he said without looking at the paper.

"Well, believe me, it's going to be "N" "O" in LARGE CAPITAL letters," said the cadet. "I'm going home to get married."

The first cross-country formation flight was recently made from Rich Field to Everman Field, a distance of about 210 miles. The flight was made with 15 planes, all of which held their positions throughout. None were forced to land. The success of the trip was largely due to the efficiency of the departments in charge of training the cadets for that work. The formation was lead by Lieut. David C. Faulkner, who is in charge of the formation stage. The ships took off in formation and landed in formation at Everman Field, where they were gassed up for the return trip. The flight was made in two hours and twenty-eight minutes.

Major C. W. Russell, J. M. A., S. C., Commanding Officer of Rich Field, has been ordered to Washington and has released command of this post. Major J. G. Whiteside, S. C. A. S., is in temporary command.

Enemy Fears Acute Airplane Shortage

London.—There are indications that the aerial reserves of the enemy are seriously depleted. A captured document lays stress on the necessity of salvaging to the uttermost all bits of aeroplanes which have crashed behind the German lines. The document says:

"In view of the situation as regards raw material, our aeroplane industry is more and more reduced to relying on the working up of instruments and motors saved from destroyed aeroplanes. The supply of material for the front has become essentially dependent upon the return of waste material from the front."

New Altitude Record Set by Lieut. Kelleher

Chicago.—A height of 23,500 feet, claimed to be a world's record for altitude by a two-seater aeroplane, was reached by Lieut. M. B. Kelleher, who flew from the United States War Exposition grounds with a passenger on Sept. 9th. They used a new oxygen apparatus. Attempting to land, the aviator crashed into a fence, but was not seriously injured. It is said the highest previous record for a plane with a passenger is 21,000 feet.

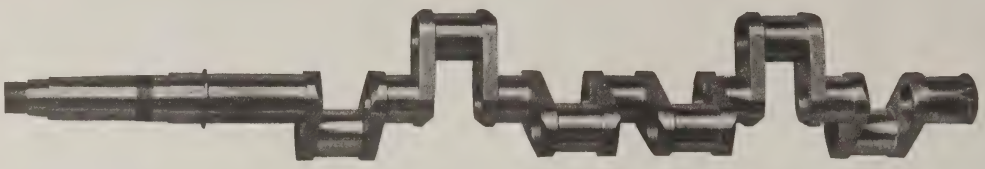
Aviators Kill a General

London.—British aviators attacking the headquarters of a German unit in the neighborhood of St. Quentin killed Gen. Hugo Hahn and the majority of the members of his staff, according to a despatch from Geneva to the London Daily Express.

According to a despatch from Basle a number of other German Generals had narrow escapes from death in aerial attacks in the same sector, where the British airmen continually are bombing the centres of concentration and the division headquarters.

(*Continued from page 68*)

ing moments without external aid. Internally the wings are drift-wired with solid circular section steel wire, of heavy gauge, but not in duplicate. It was noticed that one of the lugs to which a drift wire was attached had sheared through, but we should hesitate to say that this necessarily indicates that here was a weak point regarded from the point of view of flying stresses, as the wing had evidently been badly damaged by the machine turning over on landing.



The armament of the Fokker biplane consists of two Spandau guns mounted on top of the body and synchronized in the usual manner to fire "through" the propeller.

As regards the covering of the Fokker biplane this is chiefly remarkable, in the specimen under review, on account of the colors in which it is painted. The front portion of the body and the top surface of the top plane are painted a deep vermilion, while the rear portion of the body is painted white. The lower surfaces of the top plane and the bottom plane are camouflaged in the usual German manner by a printing in different colors of lozenge-shaped figures.

The tail plane and elevator are painted black, with the exception of a parallel portion of the top surface, which is painted white like the body.

Payne Field News

Major Jack W. Heard, Commanding Officer of Payne Aviation Field, situated at West Point, Miss., has been promoted to Lieutenant Colonel. Colonel Heard has been in command of the Payne Field since early in April, when Payne Field was converted from a construction camp to one of the most modern aviation fields in America. Ninety cadets were recently commissioned after having been trained at Payne Field without a major accident. Payne Field is situated at West Point, Miss., in the heart of an egg-shaped prairie section of Mississippi, 130 miles long by 30 miles wide, which territory is all ideal for aviation purposes, thus giving Payne Field a decided natural advantage over most fields in America. Air conditions are ideal, as well as health and sanitary conditions. Payne Field has recently been made a "Combat Field."

DISPATCH FLEETS OF LIBERTY PLANES

ROMERANTIN, Central France (Correspondence of The Associated Press).—Liberty aeroplanes were darting across the sky, other Liberties were drawn up in battalions across the big plain, and still other Liberties were puffing and struggling at their anchor tests, as The Associated Press correspondent arrived at this great centre of aeroplane production for the American fighting army. The nearby town of Issodoun is the great centre for American aviators.

Crowds of soldiers and workmen had gathered to see one of the fighting Liberties completely equipped with bombing machines, wireless outfit, all its guns, and every last device for going into combat. There had been other Liberties turned out, scores and hundreds of them now moving in a steady stream. In this and others which had preceded, the last step had been taken to give them their final equipment for actual fighting.

The big machine had a spread of forty-three feet across, and like all the others was of gray cloud-color seen from below, though above the color changed to green and merged into the green fields. Ahead pointed the machine-gun operated by the pilot, with synchronizing device by which some hundred shots a minute flew between the blades of the spinning propeller. Further back, in the observers' nests, two more machine-guns had a sweep of both broadsides and upward and rearward. There was no angle they could not reach, and even the Gotha trick of shooting straight down through a floor tunnel was more than matched, though details of how this is done cannot, of course, be given. It is sufficient to say that this new type, long and anxiously awaited and now a reality, armed for combat, was as formidable as any car ever produced, and in the judgment of these experts was far more formidable than any of them.

Recording Power and Speed

Climbing into the pilot's seat there was an opportunity to see the workings of this big car—the pioneer of the fighting squadrons soon to come. The powerful motor, with all its pistons jumping, was just ahead, with two long exhausts sweeping back toward the tail. Within the seat were straps to hold the pilot in a headlong flight, and all the delicacy of mechanism one sees in an automobile—speed indicator, gas meter, oil pressure, throttles, switches—and much more besides; lights for signalling, height meter and compass, and fire extinguishers to fight a blaze.

"This is the joystick," said Captain X., as he swung the lever controlling the tail and ailerons. And he pointed out that the foot rudder, which controls the horizontal movement, worked on the same principle as the bob-sled.

"Truly it is a wonder," he said, fondling the mechanism. "I know them all—English, French, Italian—and there is nothing like this for power and speed. Why?"

And then he gave an instance of what had been accomplished in a straight rise from the ground, which constitutes a record far exceeding anything before. This was made in one of the Liberties recently turned out here. It was not regarded as one of the best of the machines, and the workmen even dubbed it "False Alarm!" But it soon proved its rights. It was sent to one of the training fields, and on one of its first ascents it shot up straight from the ground to the height of 20,400 feet in 35¾ minutes.

"It is the fastest time a human being has ever gone up," said the Captain, "and it gives an idea of what is ahead when these squadrons are in line."

If details could be given of the number of these planes and the squadrons equipping for the battle line, it would cheer those who have grown heartsick with waiting and charges and investigations, and would let them know the day of real accomplishment was at hand in the thick of the fighting. Without giving numbers, it can be said that we saw these machines crowding a vast workshop in such arrays that their wings touched and covering much more than the area of a city block. They were not piecemeal cars, but all ready to go forward. They have been passing by the score daily into the hands of the aviators, and squadron after squadron was being made ready for the front.

We saw them in combat formation over the flying field of Issoudoun. This was no longer a vague promise of the remote future, it was at hand, and we saw these machines in vast number arming and starting for the battlefront.

The testing of the engines gave an idea of the tremendous power of the new cars. The cars were anchored by heavy chains, and workmen gripped the long body to keep it from plunging as the propeller started and the engines gave out a long wail. The men, gripping the chains and rigging, were swept as though in a tornado, the grass was flattened and great clouds of dust rose like the smoke of batteries. There is an awe in the power of this engine and its whirling propeller, and a danger, too, which the men have learned.

The suction of the propeller while the car is on the ground is far greater than has ever been known with other cars. A workman was drawn in, and killed the other day, and the great maelstrom of rushing air sucks in everything coming within ten feet of its mouth. But this is merely a detail of testing and has no bearing on the capacity of the car for flight. Like the power of the engine, the propeller is much larger and heavier than in other cars.

This turning out of the new type of American Liberties is only one of the activities of this mammoth air service production centre located here, with huge shops and warehouses, 2,700 men, 200 officers, and 1,200 Chinese laborers. All the planes made in America come here in parts, to be assembled, tested, armed, and all the other makes of planes are mobilized here preparatory to going into use on the flying fields and the front. There is, besides, the huge work of receiving the wrecked planes as they come here riddled with bullets, their wings torn off, which tell of a fierce contest. Such as can be made serviceable again are sent back to the field, while the wreckage of those beyond repair strew an immense field and is a ghastly reminder of the heroic sacrifice their pilots have made.

The process of assembling the machines as they come from America was followed through its various stages in the six huge "bays" of the workshop, each bay having a capacity of eighteen machines, or over 100 machines going forward at the same time. Nine huge boxes bring the different parts. First, the fusilage or body is set up, the motors installed, the landing wheels attached, the wings and tail adjusted, the gun racks and armament prepared, and soon a complete car ready for flights grows out of the scattered parts.

How many are turned out daily cannot be stated, but it can be said that the capacity of this big aeroplane centre working in eight-hour shifts is fifty complete aeroplanes a day. And in these days, when the mobilizing of machines follows close on the mobilizing of men, the actual production is not far from the full capacity.

ALLIED AIR CONTROL PLAINLY SHOWN

In the Week's Fighting the British Alone Destroyed 101 Enemy Planes

SO far as air fighting is concerned, the past week has been one of the most remarkable of the war. At least three aspects of the week's work will take a good deal of explaining by the Germans.

First, the British independent air force dropped more bombs on German towns in five days than had been dropped at any previous time in a fortnight.

Second, in twelve hours British airmen took more aerial photographs of German positions behind the Hindenburg line than any previously recorded day's total.

Thirdly, in a single air fight over the German coast defenses in Belgium, British airmen destroyed or drove down out of control eighteen enemy machines, or nine for each of the two British machines reported missing.

These facts show that the initiative in the air, as on land, has passed definitely into the hands of the Allies.

Foremost among the achievements of the week must be placed the remarkable effort of the independent air force against the enemy railways near Metz and in the St. Mihiel salient. It easily broke all records both as regards the number of objectives attacked and the weight of bombs dropped. Acting in conjunction with the Franco-American offensive it made thirty-five separate raids between Friday morning, September 13th, and Monday night, the 16th. Of these thirteen were directed against the vital railway junction and triangle at Metz-Sablon, four against the junction at Courcelles, eight against Saarbrücken, Kaiserlautern, and Mainz, while heavy attacks were also made upon important enemy airdromes at Buhl, Boulay, Frescati, and Hagenau.

Air attacks upon such important railway centres have a direct and powerful effect upon the military operations of the enemy, delaying much-needed supplies of arms and ammunition, disorganizing and preventing the rapid transport of troops and withdrawing large numbers of enemy aircraft from the zone of battle.

In addition there were remarkable simultaneous long-distance raids into Germany. These were directed against chemical and aeroplane factories.

In all over sixty tons of bombs were dropped in five days, or more than half the total weight of bombs discharged by the Independent Force in the preceding month, which in itself constituted a record.

On the northern battlefront in France in the course of two days' fighting, seventy-two German machines were destroyed, twenty-seven sent down out of control, and one hostile kite balloon shot down in flames, making a total of 100 enemy aircraft accounted for in forty-eight hours. In the same period thirty-two machines were reported missing.

Simultaneously with this heavy fighting in the air, British bombing squadrons were very active, dropping over seventy tons of bombs upon military objectives behind the battle line.

In all, British airmen on the western battlefront in the past week have dropped upwards of 120 tons of bombs, exclusive of those dropped in Germany, have destroyed 101 enemy machines and driven down thirty-seven more out of control. Fifty British machines were reported missing.

AIR-BOMBING CHIEF PRAISES AMERICANS

Tells of Splendid Work of Escorting Squadron Co-operating with British

THE commander of the American aero squadron on the American front has received the following letter from the chief of the British squadron, with which the American forces have been co-operating:

"I would like very much to express in writing the gratitude felt both by myself and the personnel under my command for the exceptionally fine escort work done by your squadron when escorting in bombing raids.

"We all have agreed that when the squadron is escorting in our raid we have nothing to fear from the enemy aircraft. Although it often is imperative to fly low, thus making a very long trip over the lines, nevertheless your squadron always has stuck to us.

"On one or two occasions one of our machines would straggle owing to engine trouble, but these machiness had no need to fear the attacking enemy aircraft as one of the escorting machines would always look after the straggler.

"On many occasions enemy aircraft have attempted to attack our bombing machines over the target, but they never have been successful owing to the excellence of the escort.

"Finally, I can only say that I do not consider any squadron in France is supplied with a better escort than is my squadron."

HOW THE AERIAL MAIL TOOK A REPORT TO GENERAL PERSHING A WEEK SOONER

HOW the aerial mail took a report to General Pershing a week sooner is told by the publication *Personnel*, published by the Adjutant General of the United States Army. The article is entitled "It Couldn't Be Done, But——," and read as follows:

General Pershing had cabled an urgent request that all officers be re-rated before being sent to France. A Western division was on its way and had stopped at a pre-embarkation point. It was essential that the officers make new ratings at once, particularly in view of the fact that the old ones had been inaccurate because of lack of instruction.

A representative of the Personnel organization was therefore sent from Washington to address the twelve hundred officers of the Division and instruct them in proper methods of rating. He left on the 9 o'clock train, the last one that would get him to his destination before 4 o'clock, the time appointed for the meeting.

About 9:30 it was discovered by two other members of the organization that important papers he would need were in the office—among them a complete analysis of the previous ratings of the Division that indicated clearly the improvement necessary. They knew, without being told, that lack of these papers would handicap the effectiveness of his instruction; hence some way had to be found for getting them to him.

As usual, everybody said it couldn't be done. There was no train and no other means of communication fast enough. *Yes, the aeroplane mail service operated between Washington and Philadelphia, but the mail was closed.* Besides, the mail bags were locked and could not be opened except at the Philadelphia post office. This would not allow time for the swiftest courier to reach the camp before the meeting. As a final barrier, there was no courier available.

It couldn't be done. Yet it *had* to be done. And the arrangements had to be made by telephone in less than twenty minutes, for the aeroplane was to leave at 11 o'clock.

It *was* done. The Second Assistant Postmaster General authorized the necessary steps. The papers were received and carrid by *the aeroplane* as an outside package. At the aviation field the package was dropped into the hands of a motorcycle courier sent from the camp. He sped off and arrived just in time for the meeting. As a result the new ratings of the Division from the West are accurate ratings—ratings that can be depended upon by the command overseas.

The United States Army today is an efficient army. It is demanding results and getting them. The reason is that throughout the organization is growing constantly a spirit of co-operation and singleness of purpose—a spirit which enables it to do what *has* to be done—even when told that it *can't* be done.

THE NEWS OF THE WEEK

Allied Air Services to Pool Resources

A dispatch from Paris by Charles H. Grasty, special correspondent of the New York *Times*, says:

After spending several days at aviation headquarters on the American front John D. Ryan is back in Paris working with the British and French on aviation plans. He and Winston Churchill spent yesterday together and there is close co-ordination between them and the French.

Mr. Ryan's effort is in the direction of pooling resources and getting the greatest possible force to the front in the shortest possible time. Allied representatives are meeting him in the same spirit and they are getting results.

Mr. Ryan was much pleased with the showing made by our air service in the recent offensive, which he had an opportunity of observing.

Long Island Flyers Made One Brigade

All the flying fields at Long Island will hereafter be known as the 1st Reserve Brigade of Long Island, with the main headquarters at the Hazlehurst Field, Mineola.

Lieutenant Colonel Claude K. Rhinehart will command the brigade, which includes Hazlehurst Plateau, the H. J. Damm Field at Babylon, the Brindley Field at Comac, the Major Lufbery Field at Wantagh and the Mitchel Field at Hempstead.

Major Robert D. Wrenn commands the Mitchel Field; Lieutenant Colonel Archie Miller, the concentration field; Major Whitten J. Fast, Brindley Field, and Captain H. B. Peters, Hazlehurst Plateau. Major Thomas Hitchcock commands all flying and his assistant is Captain F. H. Harvey.

Major John S. Phipps, formerly a crack polo player of Meadow Brook, is the executive officer of the brigade. The brigade adjutant is Lieutenant James J. Gambs, and Lieutenant J. R. Homer Akers is his assistant. Lieutenant John R. McKee of California and Lieutenant James D. Cassel, who is a son-in-law of Inspector General A. W. Brewster, are adjutants for the Hazlehurst Field.

Athletic Equipment for Army Aviators

An appeal for athletic equipment, and also musical instruments, for the enlisted men of our aviation forces has been issued by the National Aeronautic Committee, 289 Madison avenue, New York, of which Mrs. Newton D. Baker is honorary chairman, and Mrs. Charles A. Van Rensselaer, chairman. The committee, which is under the direction of the War Department Commission on Training Camp Activities, has received requests from officers in command of Army air squadrons going overseas and also from all air training stations in this country, to supply equipment for baseball, football, soccer, basketball, track athletics, volley ball, indoor baseball, medicine balls, punching bags, boxing gloves, etc. Major General Kenly endorses this work, it is stated.

75 Planes to His Credit

Toronto.—Capt. McCaul of the Royal Air Force, who is said to have brought down seventy-five German aeroplanes, or three more than the number credited to Lieut.-Col. Bishop, Canada's crack aviator, arrived here on Sept. 17 en route to spend a six months' furlough at his home in western Canada. He was aboard the steamship shelled by a German submarine a few miles off an Atlantic port.

Capt. McCaul, who wears the D. S. C., Military Cross, and the Distinguished Flying Cross, is said to have been recommended for the Victoria Cross.

5 Yankee Flyers Win Decorations on British Front

With the American Armies in France.—The brilliant work of the American airmen on this front, particularly during the great August battle, has been quickly recognized by the British, who have just conferred the coveted Distinguished Flying Cross on five American airmen. This is the first time such a decoration has been awarded to airmen not of British nationality.

In August occurred the first battle where all the American units pacticipated under American leadership, and of seventy-five machines downed during the month by the Americans most of them were brought down by these units, and this does not include unofficial victories or indecisive combats. One unit had twenty indecisive combats, and one pilot who is credited officially with six destroyed enemy planes has seven unofficial victories which he has not claimed.

Among those decorated are Lieuts. G. M. Vaughn of Washington Avenue, Brooklyn; Merton L. Campbell of Wakeman, O.; L. A. Hamilton of Burlington, Vt.; Thomas J. Herbert and James A. Keating.

Ensign Arthur Childs Burns, Senior Flight Officer, United States Air Station, Rockaway Beach, L. I.

New Aviation Base

The Government is planning to establish an aviation base in San Pedro in connection with the submarine base in the outer harbor.

Camp Greene to Be Enlarged

The biggest aviation training and concentration camp in the world is to be established at Camp Greene, N. C. Announcement to this effect has been made by Secretary of War Baker. As rapidly as possible arrangements will be made to provide accommodations at the camp for at least 15,000 aviators, and after the camp gets in full swing it is expected that as many as 25,000 fliers will be in training there at one time.

Camp Greene has been abandoned as a divisional training camp. More recently it has been used as a remount station, but this also will be discontinued, the remount service being removed elsewhere. The camp is located near Charlotte, N. C.

AT AN AMERICAN REST CAMP IN SOUTH OF ENGLAND CENTRE
Major Mackenzie Rogan, M.V.O., Bandmaster of the Coldstream Guards and part of the American Air Service Band

Putnam, American Ace, Killed Near St. Mihiel

First Lieutenant David E. Putnam of Newton, Mass., American ace of aces, was killed on Thursday, Sept. 12, while on patrol along the American lines north of St. Mihiel.

Lieutenant Putnam was flying with Lieutenant Wendella Robertson, when they were attacked by seven German machines. Four of these made for Putnam's aeroplane, and three attacked Robertson's. The attack was sudden and unexpected, and the enemy was able to fire from above.

Lieutenant Putnam was shot twice through the heart. His machine glided to the earth at Limey, within the American lines, where he was found by his comrades.

Lieutenant Putnam, who was 19 years old and a descendant of General Israel Putnam, had twelve aerial victories to his credit. He enlisted as an aviator with the Lafayette Flying Squadron, and made his debut Dec. 20, 1917. After seven months' training and one month's service at the front he fought his first battle and won it on Jan. 19, 1918.

One of his longest and hardest fights was on April 11, when he engaged four two-seaters for thirty-five minutes, and brought down one of them. The next day he got two out of a German "circus" of six machines. On May 15 he was engaged at close quarters with a two-seater, who fell forward, pierced by a bullet from Putnam's gun.

The young American aviator was made famous by his work in a fight on June 5, when he brought down five of an enemy squadron of ten Albatrosses. The fight took place over the battlefield of Rheims.

Speaking editorially of Lieut. Putnam the New York *Sun* says:

No American aviator had a finer single exploit to his credit than Lieutenant David E. Putnam, who has gone the way of Lufbery, Thaw, Roosevelt and many others of our young heroes of the air.

His performance above Rheims last June, when he engaged ten enemy Albatrosses and brought down half of them, has not been surpassed in the war unless perhaps by Fonck, the greatest of the French fliers since Guynemer.

Putnam was not only a great aviator, but an aggressive fighter, who went into the clouds for his foe as his ancestor, Israel, went into the cave for the wolf.

150 Yankee Air Raiders Bomb Retreating Troops

With the American Army in Lorraine.—The Germans in their retreat from St. Mihiel used two main roads. The Americans closed one of them and the sole avenue of escape left to the enemy was the St. Benoit-Woel road. Congested transports of troops and guns were struggling along the road when there suddenly appeared 150 American airmen carrying small bombs and 500 rounds of ammunition each.

Swooping down the road they pelted the bombs and bullets. Horses fell and men ran and wagons disappeared. All that was left was a jumbled mass, which enabled the American troops to make a large haul.

The War Department Authorizes the Following

Cadets and student officers at Kelly Field, Texas, are beginning a new system of instruction which will eventually require them to actually construct the ships in which they fly. This course is a departure from the regular curriculum. It is not yet general and had yet to be approved by the Training Section. At present the work amounts to twelve days in putting together wings and fuselage only. The other parts of the shop will come in little by little as the course advances, until the practical assembling of a complete aeroplane is a part of the instruction of every flyer. Instructors believe that if American fivers are required to put together the ships that they will later control, there will be less carelessness, less tendency to hurry work being done, or to overlook anything that might endanger life later on.

The new course of instruction at Kelly Field will take the prospective flyer completely through all the shops. The aeroplanes put together will be inspected by experts before they are flown and whenever an error is found in assembly the cadets or student officers who put this particular machine together will be shown what might have happened to the flyer had not the error been detected in time.

It is further believed that the new course will acquaint flyers with the functioning of all parts of their machines so that in case of forced landings they will be able to make repairs sufficient to take them home.

La Guardia is Made Major of Aviators

Congressman Fiorella H. La Guardia of New York City, who as a captain in the United States Aviation Service in Italy has been mentioned many times in dispatches for bravery, has been promoted to be a major. The promotion appeared in the army orders. Mr. La Guardia was one of the first legislators to obtain a leave of absence to serve his country on the firing line.

Embryo U. S. Aviators Fight Imitation Hun

In their eagerness to win top score over their competitors the instructors of the Gunnery School at Rockwell Field, Cal., Division of Military Aeronautics, have devised a floating sleeve target which resembles a small cylindrical shaped balloon, and when released in the air is used as the floating target at which the air gunners shoot.

At an elevation of 5,000 feet the target is released. Then the shooting begins, the aeroplanes diving at the target or running from it and using in the game every stunt known to fliers. At the mercy of air currents and being light in weight, the sleeve target twists and turns in every conceivable manner and direction, all of which tends to make it as tricky as a Boche opponent. Service ammunition is used by the gunner and this target practice takes place over areas on which there is no habitation.

The Egyptian Flying Forces

The efficiency of the British air service has been strikingly illustrated by the list of honors bestowed on officers and other ranks of the Royal Flying Corps serving with the Egyptian Expeditionary Force in 1917. The list follows:

Victoria Cross	1
D. S. O.	4
Military Cross	34
Croix de Guerre	2
Military Medal	1
Meritorious Service Medal	14
Order of the Nile	2

The airmen's work was of incalculable value during the march of the expeditionary forces northwards from the crushed Gaza-Beersheba line. The patrol work was so effective that only one enemy machine penetrated the area from which its occupants could see the movement of troops about to attack Beersheba. This was brought down by the British aviators.

Perilous long-distance flights were made by the Englishmen in Palestine, three of whom bombed Maan after a trip of 150 miles from an aerodrome in a straight course over desert land so rough that it would have been impossible to come down without seriously damaging a plane.

Aerial Gunnery and Trick Flying School

The largest aerial gunnery and trick flying base in America will be established by the War Department at Rockwell field, on North Island at the entrance of San Diego Harbor. The schools there for training army airmen will be patterned, largely, after those at Cazeau and Avord, France. The students will receive advanced training at Rockwell according to the schedule of the great French schools.

Don't Kill Carrier Pigeons

Legislation is urged in several states to make it a federal offense to kill the carrier pigeon. This action results from the slaughter of these birds near training camps, particularly in Kentucky. Carrier pigeons are of vital importance in modern warfare, carrying messages when all other means fail.

Ensign Harold A. Pulliam, holder of Hydro-aeroplane Certificate No. 237, of the U. S. Navy. His brother, K. G. Pulliam, is Captain in the Army Air Service

American Aviation Camps in France

America has an aviation camp in France, with barracks for 6,000 men, space for many hangars, rest rooms, Y. M. C. A. huts, warehouses, spare-part stock rooms and a machine shop. This mushroom city rose over night on the spot where three months before General Pershing splashed through on one of his inspection tours.

One West Point officer runs the entire camp. No pilot goes there who has not had some training elsewhere and the school is meant especially for the combat and bombing pilots.

Arizona Flyer Downs Three Foe Observation Balloons

With the American Army on the Lorraine Front.—Three enemy balloons were destroyed on Sept. 17 by Lieut. F. Luke, Jr., of Phoenix, Ariz., on a flight into the German lines. This makes his total nine balloons in three days.

With Lieut. J. F. Whener of Everett, Mass., Luke left his aerodrome at dusk and crossed the line. Within thirty-five minutes the American aviators had completed their work of destruction and the flames could be seen from the American aerodrome.

One other balloon was destroyed and three more are believed to have been shot down, but the reports have not been confirmed. Bad weather prevented bombing, however, and the only observation possible was the adjustment of artillery fire.

German aviation machine gunners and bombers attacked what they supposed to be the American positions in the region to the west of Vandieres on Sept. 17. The mist and low clouds, however, prevented the Germans from finding their targets. The Germans themselves were located and driven back by anti-aircraft fire.

The flying machine gunners dropped near the ground at several places in their determination to find the American troops, but the weather conditions were too much for them. The bombers flew at higher altitudes, but they, too, were hampered by the weather and possibly by misinformation as to the American positions, and wasted numbers of bombs.

Owing to the effectiveness of the American and French anti-aircraft fire, a number of the German machines were hit, the observers reported. When last seen the crippled planes were returning hastily to their own lines.

American aviators have performed many feats of daring and endurance the last few days.

One of the most trying experiences was that of Lieut. Snyder of a reconnoissance group, who flew with another officer over the enemy lines at a height of less than 1,000 metres in a rainstorm. They remained in enemy territory more than two hours, always flying at a low altitude.

They penetrated a distance of thirty-three miles and brought back much valuable information. Although they were repeatedly fired at by anti-aircraft guns and passed through several rainstorms, they returned safely.

The large part which aviation has played in the offensive operations is indicated by the summary of the first four days of the battle. According to this, despite the heavy rains which transformed the airdromes into seas of mud and seriously handicapped them for at least two days, the aviators were not only able to make more than 3,300 sorties, covering a period of 4,000 hours, but so thoroughly bombed the enemy aerodromes that the enemy was unable to accomplish much.

Five U. S. Planes Missing

Gen. Pershing reported in the communique of Sept. 18 as follows:

In the course of a bombing operation in Lorraine our aviators were attacked by superior forces. Five of our machines are missing.

Lieut. Ray Brooks an "Ace"

A press dispatch says Lieut. Ray Brooks of Boston qualified on Sept. 16 as an American ace by shooting down his fifth enemy plane. Lieut. Horace Lake, formerly an architect in Washington, D. C., and Lieut. Bertram Neideneker of New York City, in a French machine, are credited with being the first Americans to go over and shoot up the new German positions. Flying less than fifty yards from the ground they sprayed the roads and shell holes filled with enemy troops and returned safely.

Specialists May Choose Branch of Service

Washington, D. C.—After October 1, registrants of September 12 may be inducted into special branches of the army, which are in need of men, and for which the registrants are specially qualified. The wide-open volunteer system will not be accepted again.

Persons inducted into the army under this system must enter as privates and may be sent to officer training camps, whence they may be commissioned, but if they fail of commission they remain in the army as privates. The War Department has also let it be known that the day of civilians stepping into the army with commissions is practically at an end.

If a man goes to an officers' training camp he comes out a second lieutenant or a private. When the department needs a first lieutenant he will be promoted and so on to the captaincies and higher officers. Only a highly trained expert very necessary to the military is likely to receive a commission higher than that of second lieutenant; and practically all successful applicants for even second lieutenancies must come from the ranks.

War and Navy Department officials are now struggling with the regulations governing assignment of draftee men to army, navy and marines. It is possible registrants who are drafted may be allowed to indicate any special qualifications for these services, which the local boards may take these services local boards may take into consideration in certifying them in response to calls.

However, the tendency in the Provost Marshal General's office just now is to take from the local board the authority of decisions of this kind and the Navy Department seeks some more definite means of fixing the qualifications for men certified to it for service.

Balloon Cable as Aerial

Reports received at the Division of Military Aeronautics from Balloon Training Fields in various parts of the country, show several unusual messages received by the wireless crews, indicating increasing efficiency both in the work of the students and the equipment. The wireless station at Arcadia, California, by using for an aerial the cable of a balloon put aloft from the training field, has intercepted messages sent by the Brooklyn (N. Y.) Navy Yard. This balloon cable probably makes the highest aerial in the world.

This particular school has 106 miles of wire in use for teaching military communication. For the purpose of demonstration it has a complete system of wiring strung as it would be in the front line trenches. Communication posts and stations for all kinds of messages are used by the students the same as soldiers use them at the front.

A good part of the country southeast and southwest of Arcadia is laid out with lines of communication to this balloon school, similar to part of a sector at the front. All of the balloons, when aloft, are so wired that they can be linked together with any trench, doubled up for any work together, or they can be cut off from the trenches and talk only with their own chart room and winch or operating crew on the ground below.

One of the New York Air Raid Sirens which opened the Fourth Liberty Loan Campaign by sounding at 7.55 P. M. on Friday, September 27th. The Sirens all over Greater New York sounded for five minutes and at 8.15 P. M. they sounded the "all clear" signal. The use of the Sirens not only reminded people of the Fourth Liberty Loan, but they gave people an idea of the alarm which would be sounded in case of an actual air raid

PARIS AEROPLANE MAIL SERVICE INAUGURATED

The first trial of the aeroplane post from Paris to St. Nazaire recently. Two planes made the trip, leaving from Le Bourget and making one stop at Le Mans. The first plane carried over a thousand letters; the second followed in case of accident to the first. The Minister of Posts and Telegraphs, the President of the Aeronautic Commission, and many other officials witnessed the start of the initial flight. The photo shows the pilots who made the trip

Aero Mail Defies Storm

The storm at Belmont Park on September 18 was the worst of the month, but it did not stop the aero mail service. Pilot De Hart waited an hour and then flew south at the height of the storm, while Pilot Robert Shank came through in about the usual time from Washington and reported that he had flown from cloud to cloud, encountering the worst storm since he had been flying on the aero mail route. He kept as near the earth as possible. He left Washington at 11:45 A. M. and landed in Belmont Park Field at 2:50 P. M.

New Mail Flight Record Washington to New York

All records of mail flights from Washington to New York were broken Sept. 17 by Aviator Miller, accompanied by Aviator Newton as a passenger and the mail. The same aeroplane was used for the entire trip—a standard plane with a 150-h.p. engine. The plane left Washington at 11:36 a. m. and arrived at Philadelphia at 1 p. m.—1 hour and 24 minutes, or a speed of 91½ miles per hour. It left Philadelphia at 1:07 p. m. and arrived at New York at 1:50 p. m.—43 minutes, or a speed of 125½ miles per hour.

Time, Washington to New York, including Philadelphia stop—2 hours and 14 minutes, or a speed of 102 miles per hour. Time, Washington to New York, actual flying time, 2 hours and 7 minutes, or a speed of 108 miles per hour.

Note.—Depreciation is not estimated in this report, for lack of convincing data, but is reflected in the items under repairs, parts and labor.
Items for rent, light, power, etc.; misc.; dead time of pilots; time of hangar men, misc.; shop time of mechanics; interest on investment; and departmental overhead charges; all of which are not directly apportionable to individual ships, are pro-rated equally between all of the ships.

Aerial Mail Service in Canada

AERIAL mail service is being extended throughout the world. During the last month cables have brought reports of flights for the delivery mail and important government communications in Sweden, Norway, France, Italy, Great Britain, India and Japan. Except for the postplane deliveries in France and Italy, these flights abroad have been practically all experiments. The success of the daily uninterrupted postplane service between New York, Washington, Philadelphia and Boston has brought insistently to the attention of all other governments the necessity for this rapid and certain means of communication.

Uncle Sam's neighbor to the north is the latest to try the aerial mail service. Canada has been so busy training youths for aerial combat service abroad that it has had little time to give to the development of commercial aeronautics. But the Canadians have been alive to the possibilities of commercial aviation. Lieutenant Georges Flachaire of France recently gave a remarkable flight demonstration from Montreal to Toronto and thence on to Cleveland. A Canadian flight officer, Captain Bayne, flew in June with pouches of mail from Montreal to Toronto. He made the trip in seven hours, landing on the way at Ottawa. The flight took seven hours and was notable as being the first trip made in Canada for the delivery of government mail.

Miss Stinson's Flight

Shortly after the full success of the United States aerial service was realized, the control of the service passed into civilian hands under the control of the postmaster-general. Canada is not far behind, as may be judged from the first civilian flight with government mail made by Miss Katherine Stinson, a Curtiss flyer, on July 9, 1918. Miss Stinson flew from Calgary to Edmonton, Alberta. Hers was the first flight of the kind ever made in Western Canada.

Miss Stinson, a few years ago, was similarly honored by the United States Government.. She adds to her aerial honors the privilege of having been the first civilian to fly with mail in Canada. The editors of the leading Canadian papers speak of the flight as the actual inauguration of aerial mail service in the Dominion.

The Canadian Government has a monopoly on the handling of all mails in the Dominion. Miss Stinson was enabled, however, to make the flight through the special dispensation granted by the postmaster-general at Ottawa.

Making Canadian Record

Late in June, Miss Stinson winged into western Canada with her Curtiss aeroplane and she circled over the wide prairie stretches of the wonderful country, visiting the ranching communities. On July 9th, she was in Calgary with her Curtiss plane. Calgary is one of the wonder cities of Canada. It sprang up over night on the western frontier of Alberta. To the north is Edmonton, which until recent years was an outpost of civilization in Western Canada. But they are cities of enterprise and spirit. They are the marketing centers of the great grain basket of the Dominion. The Calgary Exhibition was in full swing at the time. Miss Stinson's flight became the climax of the successful showing of the products of the limitless prairie, draped negligently over the horizon.

Night Trip in Daylight

Promptly at 6 P. M., July 9, 1918, Miss Stinson opened the throttle and bumped over the gopher holes of a field north of the city. She was in the aid in a second and sought an altitude of 3,400 feet. Two hours and five minutes later, she swooped as gracefully as an eagle over the landing field at Edmonton and made a perfect landing. Miss Stinson, America's greatest woman flyer, had flown the 196 miles in exactly 125 minutes.

In the cockpit of the machine, Miss Stinson carried a pouch containing 259 letters. One was addressed to the Honorable Mr. Brett, premier of the Province of Alberta. Others were addressed to the mayors of the cities of the plains, to the police chiefs, to army officers, to postmasters, to women's clubs and to newspapers. Postmaster King of Calgary had personally cancelled each of the letters. The postmaster of Edmonton officially received the mail pouch when Miss Stinlanded at the capital city.

In the enthusiastic crowd which gathered about Miss Stinson's Curtiss plane when she landed at Edmonton were two Royal Flying Corps officers. One of them had but recently returned from overseas service and the other had finished his course of training and was ready to join the British flyers abroad. They knew the worth of the Curtiss machine; they had completed their training in the cockpit of these reliable machines. But they were surprised that a woman, frail and girlish as Miss Stinson, had been able to complete the flight in an elapsed time they would have been proud to have made.

Guided by School Map

The flight was made in broad daylight. It is quite possible during this season of the year to read a newspaper in the open as late as 10.30 o'clock at night. Daylight continues long after the sun has sunk below the wheatfields. In the flight, Miss Stinson guided herself with the aid of a schoolbook map she had torn from a book. The splendid little flyer has a habit of using any sort of a map which is readiest to hand when she is about to cloud-trek across country. She had no difficulty in directing her course with this small map. On the back of it ,she wrote an account of her trip and sent it to the welfare division of the Curtiss Aeroplane and Motor Corporation.

AIR SERVICE OPEN FOR ENLISTMENTS

IRRESPECTIVE of status in the draft, the Air Service has been reopened for induction of mechanics and of candidates for commission as pilots, bombers, observers and balloonists, after having been closed, except for a few isolated classes, for the past six months.

The fast moving overseas of air squadrons, planes, motors and material for American airdromes, fields, and assembly plants in France and England, together with the completion here of 29 flying fields, 1,200 de Haviland planes, 6,000 Liberty motors, the parts for the first heavy night bombers, 6,600 training planes and 12,500 training engines, has led to the necessity of increasing both the commisioned and the enlisted personnel in order to maintain full strength in this country and continue the necessary flow overseas. As a result the Air Service, alone, is now half as large again as the whole American Army at the outbreak of war.

Civilians have not been given an opportunity to qualify as pilots since last March. During last fall and early winter, a reservoir of over 6,000 prospective flyers, accepted by the Examining Boards, had been built up, and has since been gradually drawn off as room has been made for them in the aviation ground schools through graduation. Moreover, a large number of men already serving in the ranks of the Air Service have been permitted to train for commissions, in line with the policy of promoting men from the ranks whenever possible.

The available number of men possessing the necessarily very high qualifications is insufficient for the needs and as a result it is now possible to examine and accept men from civilian life, in addition to those in the enlisted personnel. The number of men who must be examined is great indeed compared to the number of men who become finished pilots. Practically one applicant out of every two is found unfit for flying at the first examination, while, even of those accepted, a large number prove wholly unable to do the mental work necessary in learning the theories of flight, radio, photography, bombing, machine gunnery, and artillery observation, so that fully 15 per cent are disqualified in the first step at the ground schools and still more in the actual flying courses later.

While this present call for flying candidates is being made generally, it is hoped that in order to avoid unnecessary pressure on the Examining Boards, possible candidates will consider whether they have both the physical and the mental qualifications necessary. The age limits for flyers are from 18 to 30 inclusive, with preference to those under 25, and for balloonists from 18 to 45. Applicants may apply at the Aviation Examining Boards located at:

Atlanta, Ga., Georgia School of Technology.
Boston, Mass., 739 Boylston Street.
Chicago, Ill., 230 East Ohio Street.
Dallas, Texas, Camp Dick.
Fort Sill, Okla., Post Field.
Los Angeles, Calif., Marsh-Strong Building.
Mineapolis, Minn., University of Minnesota.
New York City, 104 Broad Street.
San Antonio, Texas, Fort Sam Houston.
San Francisco, Calif., 55 New Montgomery Street.
St. Louis, Mo., 525 South Euclid Avenue.
Washington, D. C., Building "D," Floor 1, Wing 2.
Canal Zone, Camp Sherman.
Or to the Personnel Section, Division of Military Aeronautics, Washington, D. C.

The call for mechanics opens the Service to a large number of skilled men anxious not only for active field service, but also for service for which their training best fits them. Skilled men only are wanted. Others would have no value in the highly delicate and technical work required. Those accepted will be sent to a Concentration Depot, trade tested, given a special intensive training in the new science of airplane mechanics, and then organized into aeroplane crews and squadrons, some for duty here, others for duty overseas, with especially good opportunity for advancement, since over four-fifths of the men are promoted above the grade of private. The classes especially desired as shown by the last year's experience are:

Airplane mechanicians, cabinet makers, chauffeurs, electricians, auto mechanics, radio operators, motorcyclists, tailors, instrument repairmen, armorers, carpenters, clerks, motor mechanics, riggers, engine repairmen, propeller makers, stenographers, machinists.

The Air Service today is over 160 times what it was on the outbreak of war.

Applicants, as mechanics, who will be accepted between the ages of 18 and 55 inclusive, may receive further details from the Department Air Service officers in the six departmental headquarters located at Boston, New York, Chicago, San Francisco, San Antonio, and Charleston, S. C.; the Air Service Trade Test Boards located at:

Army Recruiting Office, Atlanta, Ga.
739 Boylston Street, Boston, Mass.
230 East Ohio Street, Chicago, Ill.
Tramway Building, 14th and Arapahoe Streets, Denver, Colo.
Third Floor Municipal Courts Building, Detroit, Mich.
104 Broad Street, New York City.
Care of Department Air Service Officer, Western Department, San Francisco, Calif.
Third and Olive Streets, St. Louis, Mo.
Madison, Wisconsin.
Fifth and Dodge Streets, Omaha, Neb. (Army Building).
Care of Air Service Mechanics Training School, Overland Building, St. Paul, Minn.
Kelly Field, San Antonio, Texas, Air Service Mechanical Training School.
Or by writing direct to the Personnel Section, Division of Military Aeronautics, Washington, D. C.—Committee on Public Information.

MILITARY AEROSTATICS

By LIEUT. H. K. BLACK, R.F.C., C.F.A.

THE life of a balloon at the front is variously estimated at from one hour to several months, depending entirely on weather conditions and the accuracy and persistency of the enemy aeroplanes and anti-balloon gunners. In camps in the United States the average effective life of a balloon may be said to be four or five months, barring accidents.

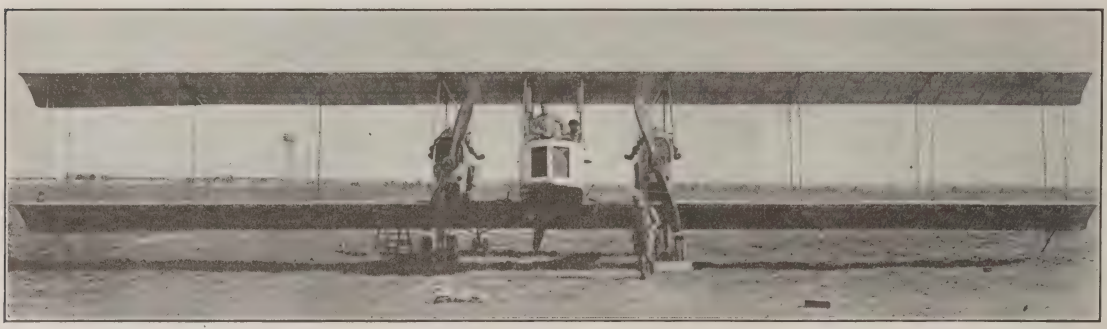
Handling a balloon in the field has a great deal to do with its life. In camps in the United States the average effective life of a balloon company depends a good deal on balloon construction.

In the case of a balloon with the observer in the basket and the artillery officers still farther away, the problem is to transmit the orders and information accurately and quickly. These communications are maintained by means of the telephone. The telephone wire is sometimes a separate cable, but in some cases the telephone wire is in the center of the main cable. This is a specially stranded ¼-inch steel cable.

The windlass by which the cable and the balloon are controlled is mounted on a truck which can travel while the balloon is in the air. Also originally of French invention, the construction of this apparatus has been undertaken by American companies.

Many other accessories had to be specially developed for the balloon service. The production of hydrogen and the necessary equipment was a big problem involving work along many angles. First, the gas itself, including field generators and main supply stations; secondly, containers for shipping and storage purposes; third, methods of transferring the gas from the containers for shipping and storage purposes, and, fourth, methods of transferring the gas from the containers to the balloon.

Along with the production of balloons, the necessary inspection was a factor not overlooked. In this connection the best balloon talent known to the Allies has come forward, stepped into the harness, and built up the present organization which passes on all the army balloons manufactured in the United States.



Balloon Beds

MANY different kinds of beds for balloons have been tried in the Allied armies since war broke out. As has been the case with a great many present-day practices the present bed was evolved after many trials. The best features of all the experiments have been retained and those things which have hindered the greatest efficiency of the balloons have been gradually eliminated. Not all these things have been done away with, however. The balloon bed as it is in general use today in France is not all that could be desired, but it is immeasurably better than any which were used near the beginning of the war. Previous to the declaration of war, balloons in military service were almost a nonentity. The tremendous amount of publicity the aeroplane got almost completely overshadowed the silent sausages. Balloons of the spherical type were used for sporting purposes and a few—a very few—observation balloons of the Drachen type were the property of the Army and Navy.

(To be continued)

Royal Naval Air Service Cadets laying out the fabric of a kite balloon of a small dirigible airship previous to inflation with gas. The envelope is laid out evenly on a ground sheet and the rigging attached before the gas is admitted. Behind the cadets can be seen the car and lower portion of the envelope of a "Blimp," the small dirigible airship before referred to. The filling hose, made of rubberized canvas, can be seen attached to the inflation sleeve preparatory to inflation with hydrogen. The car is very much like the body or fuselage of an aeroplane. Two men can be seen standing on the car while they adjust the engine.

This is a Caproni biplane for bombing work. It is equipped with three Liberty motors. This plane was built by the Standard Aircraft Corporation of New Jersey, and first flown on July 4, 1918, at Mineola, L. I., by three Italian officers

AMERICAN CAPRONI MEETS TEST IN AIR

Equipped with Liberty Motors, It Reaches Altitude of 14,000 Feet, Carrying 3,000 Pounds

THE American-built Caproni bi-plane, equipped with Liberty motors, September 21st surpassed expectations of allied officers in the first of a series of altitude, weight-carrying, and speed tests to determine its qualities as a bombing plane. In a flight of an hour the aeroplane reached an altitude of 14,000 feet, carrying three men, gasoline for a five-hour flight, and 1,900 pounds of lead. Allied army officers said they thought the test was extremely successful, and particularly because a brisk wind was blowing throughout the flight.

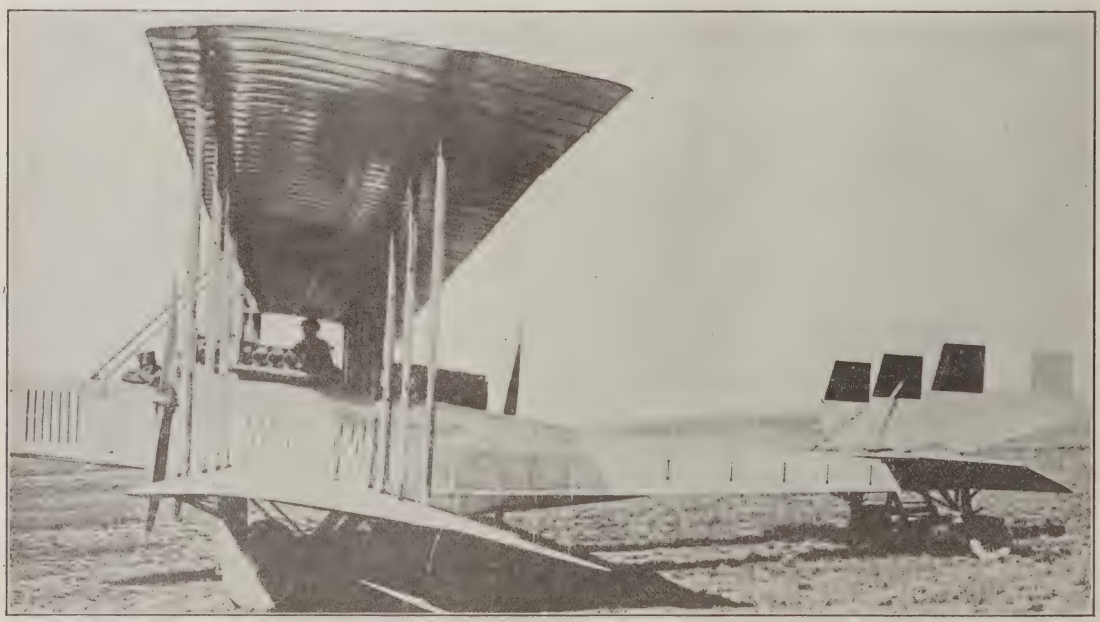
Captain Ugo d'Annunzio and Lieutenant Julian Parvis, of the Italian Flying Corps, piloted the machine throughout the test, and they were accompanied by Captain H. Harris, an American army officer, who made observations with instruments and kept a record of the flight. The average weight of the men was about 170 pounds, so that the plane was carrying a burden of almost 3,000 pounds.

Major Gen. J. Franklin Bell, commander of the Eastern Department, made an official observation of the flight, and Colonel Brant, of the Department of Military Aeronautics, was delegated by Major General William L. Kenly, in command of the department, to compile a report. With him were Major Martin, Lt.-Col. Rhinehardt and Major Brown. John D. Ryan, Second Assistant Secretary of War, in charge of the aviation program, was represented by J. Gilmore Fletcher, A. A. Landon and William Erb. G. Bevione, head of the Italian mission, with other Italian, French, and Canadian officers, observed the flight so that they could make reports to their aviation departments upon the efficiency of the Caproni as a bombing machine.

Before the official flight 500 cadets from the ground school of the Aviation Section at Princeton University arrived. They were permitted to study the construction of the machine and its engines, and were taken to all the hangars at Hazelhurst Field to examine the De Havilands, the Nieuports, and other planes there.

Much admiration for the performance of the motors was expressed by the allied officers. Other tests for speed will be made within a few days.

The plane, with its sweeping wing-spread of almost 100 feet, and its three Liberty motors, each capable of exerting the energy of 325 horses, averaged 105 miles an hour for one hour and soared to an altitude of 13,500 feet in sixteen minutes.



After the tests, over which officials expressed delight, Lieutenant Parvis said he would take up as many present as could crowd into and around the roomy cockpit. Nine clambered in. The biplane rose with them to 10,000 feet with apparently as much ease as when less heavily burdened.

Unofficial witnesses of the flight agreed that no one could mistake its train-like roar for the flight noise of any other flying machine.

Among those present at the tests were Mr. Alan R. Hawley, president of the Aero Club of America; Henry Woodhouse, editor of AERIAL AGE; Captain Robert Bartlett, the famous Artic explorer; Major Falchi, Captain Carlo Tappi, two veteran Italian aviators who participated in the Italian-Turkish war in 1912.

Sir William F. Bailey, president of the Canadian Aeroplanes, Limited, was also present.

Major Barsetta and other officers of the French Aeronautic Mission, including Captain Jacques Boyriven, who flew the last Nieuport and made a speed of 163 miles an hour with the wind—while his disconsolate Boston terrier "Billiken" cried pitifully because he was not taken along. Captain Harris is the officer who piloted the machine that took Major La Guardia from Milan to Rome recently.

"FIRST LIBERTY CAPRONI"

The first of the "Liberty" Caproni biplanes which is being built for army service. The plane is of the famous Italian manufacture with the new American "Liberty" motor installed.

The AIRCRAFT TRADE REVIEW

Aircraft Celebration

More than 5,000 men and women, employes of the Wright-Martin Aircraft Corporation at their Long Island City plant, joined recently in a patriotic demonstration under the direction of the Bureau of Aircraft Production, New York District. The program was directed by Charles E. Mack of the bureau, assisted by E. G. Pratt. The assemblage was in one of the big new buildings, capable of housing nearly 1,000 men at work, which is being completed for the company under special requisitions given by the Government.

A band marched at the head of more than 1,000 men employed as the night shift. Sergeant Ed Doyle of the First Canadian Contingent made an address and played his violin to lead the singers. George Houston, president of the Wright-Martin Company, announced that his company has furnished the United States Government with 3,000 motors and that the Government has now made demand for more than three times that number, to be completed before the summer of 1919. Captain A. P. Simmons, formerly of the 18th Regulars, said the workers of the industrial army were as essential as the men in the trenches. Congressman Charles Pope Caldwell of the Second District, who prepared the draft of the bill providing for the $614,000,000 for aircraft production, told of the necessity for rushing supplies needed by the army and the aero squadrons.

Goodyear Gets Aero Mail Letter

F. A. Seiberling, president of the Goodyear Tire & Rubber Company, Akron, Ohio, was among those who received mail carried by aeroplane, on the inaugural trip of the newly-established New York-Cleveland-Chicago Aerial Mail Line. The letter received by Mr. Seiberling was from Mr. Henry Woodhouse, the editor of *Flying*, a leading aeronautical magazine, expressing appreciation of his energetic efforts in hasting the production of aircraft at the Goodyear plant.

Personal Pars.

William B. Stout has resigned his position as technical adviser to the Aircraft Board at Washington and has returned to Detroit to take up the manufacture of a plane of his own design. The experimental work and preliminary construction is being carried out by W. C. Rands, of the Rands Mfg. Co., Detroit.

The following is a list of purchases contracted for by the Bureau of Aircraft Production:

[NOTE.—The first number at the beginning of each paragraph is the Order Number, the second the Contract Number.]

August 9, 1918

30442-18. 2250-2. Wright-Martin Aircraft Corporation, New Brunswick, N. J., spares for 150-horsepower type A Hispano-Suiza engine.

380630. 4453. Curtiss Aeroplane & Motor Corporation, Buffalo, N. Y., hexagon-head bolts with castellated nuts.

710121. 4448. Cherry Lumber Co., Cincinnati, Ohio, 60,000 feet walnut lumber.

710122. 4449. Brown & Harris Lumber Co., Holmesville, Ohio, 50,000 feet walnut lumber.

720116. 4452. West Virginia Aircraft Corporation, Wheeling, W. Va., spares for 500 JN4D training planes: Engine-bed bearers, elevators, rudders, wings, landing gears, etc.

720238. 4441. John A. Roebling's Sons Co., Trenton, N. J., 240,000 feet balloon cable.

720254. 4451. Pyrene Manufacturing Co., care of H. B. Vandergrift, Continental Hotel, Washington, D. C., 5,000 Pyrene fire extinguishers.

720257. 4454. Liberty Iron Works, Sacramento, Cal., spares for 100 JN4D planes: Elevators, vertical fins, landing gears, rudders, wings, etc.

750028. 4450. International Register Co., Chicago, Ill., 3,500 mechanical interrupter gears.

August 13, 1918

20038A10. 1816A. Dayton-Wright Airplane Co., Dayton, Ohio, spares for D.H.4 planes: wings, stabilizer braces, front direct-wire fitting with tie rods.

20038A11. 1816A. Dayton-Wright Airplane Co., Dayton, Ohio, parts for D.H.4 planes: wings, right and left ailerons, elevators rudder, landing gears, etc.

30442-20. 2250-2. Wright-Martin Aircraft Corporation, New Brunswick, N. J., spares for Hispano-Suiza motors; Speedometer shaft and bushing assembly, cotter pins, air pump parts, gaskets, nuts, etc.

320017. 4472. N. C. L. Engineering Corporation, Providence, R. I., 50 N. C. L. windlasses, complete.

320018. 4473. James Cunningham Son & Co., Rochester, N. Y., 25 Cacquot windlasses.

320019. 4474. McKeen Motor Car Co., Omaha, Nebr., 25 Burton windlasses.

480057. 4481. Cleveland Tractor Co., Cleveland, Ohio, 10 standard model H Cleveland tractors.

710115. 4439. Livingston Radiator & Manufacturing Co., New York, N. Y., 541 Handley-Page type radiators.

710129. 4484. Whittaker-Glessner Co., Portsmouth, Ohio, 700 steel drums, 110-gallon capacity.

710131. 4487. Chase Metal Works, Waterbury, Conn., seamless copper tubing.

710132. 4490. Sheffield By-Products Co., New York, N. Y., 40,000 pounds casein.

August 14, 1918

320020. 4482. N. C. L. Engineering Corps, New York, N. Y., 1 N. C. L. kite balloon windlass.

370117. 4493. Gilbert & Barker Manufacturing Co., Springfield, Mass., 10 tanks of 10,200 gallons' capacity each.

380702. 4492. Dobbie Foundry & Machine Co., Niagara Falls, N. Y., 100 No. 21 single-drum hand-power hoists.

380705. 4494. Henry Cheney Hammer Corporation, Little Falls, N. Y., 14,400 hammers.

380706. 4495. Henry Cheney Hammer Corporation, Little Falls, N. Y., 13,150 hammers.

380708. 4498. Collieries Supply & Equipment Co., Philadelphia, Pa., 48 electrical engineers' chests.

450020. 4497. Blaw-Knox Co., Pittsburgh, Pa., furnishing and fabricating necessary structural steel and accessory structural material for the construction of 70 hangars.

450021. 4406. Belmont Iron Works, Philadelphia, Pa., furnishing and fabricating 576 columns (approximately 1,500 pounds each).

710130. 4485. Whittaker-Glessner Co., Portsmouth, Ohio, 1,000 steel drums, 110 gallons' capacity.

70135. 4477. Ayer & McKinney, Philadelphia, Pa., 30,000 pounds casein.

720169. 4488. Standard Aero Corporation of New York, Elizabeth, N. J., 30 E-1 advanced planes constructed to mount Gnome motors.

720190. 4480. Standard Aero Corporation of New York, Elizabeth, N. J., 6 E-1 advanced planes constructed to take LeRhone motors.

720280. 4483. Fedders Manufacturing Co. (Inc.), Buffalo, N. Y., 109 radiators complete, with inlet and outlet connections.

720285. 4496. Hartzell Walnut Propeller Co., Piqua, Ohio, 1,000 wooden air fans.

720290. 4499. Hardman, Peck & Co., New York, N. Y., 500 sets of laminations for Handley Page propellers.

720295. 4501. Parsons Pulp & Lumber Co., Philadelphia, Pa., 4,800,000 feet spruce.

730204. 4500. Dayton Adding Machine & Tire Leek Co., Dayton, Ohio, 1,000 gun synchronizing generators.

730210. 4503. Light Manufacturing & Foundry Co., Pittstown, Pa., spares for OX5 engine, upper and lower crank case, bearing caps.

840041. 4489. Lamb, Finlay & Co., New York City, for services in connection with the handling, paying of duties, and shipping of airplane linens, tapes, and balloon cloths, which are being imported from Great Britain for the Bureau of Aircraft Production.

August 15, 1918

410087. 4505. Louisiana Oxygen Co., New Orleans, La. 500,000 cubic feet hydrogen gas.

710137. 4504. Isaac McLean Sons Co., Dorchester, Boston, Mass., 10,000 feet African mahogany and 25,000 feet Mexican or Central American mahogany.

730198. 4491. Ericsson Manufacturing Co., Buffalo, N. Y., parts for Berling, type D8I magneto (99 items).

780031. 4508. Link Tool & Machine Corporation, New York City, miscellaneous thread gauges to be furnished from time to time.

820017. 4506. Paul Whitin Manufacturing Co., Northbridge, Mass., 25,000 yards cotton airplane fabric.

August 16, 1918.

30442-21. 2250-3. Wright-Martin Aircraft Corporation, New Brunswick, N. J., spares for type 3 engine (43 items).

31072-2. 2250-3. Wright-Martin Aircraft Corporation, New Brunswick, N. J., spares for type 3 engine (43 items).

370124. 4519. Universal Grinding Machine Co., Pittsburg, Mass., 1 No. 2 grinder with C equipment.

An interior view of the Springfield Aeroplane Company's plant

THE FUTURE OF THE AIRCRAFT INDUSTRY

By BENJAMIN L. WILLIAMS

THE future of the aircraft industry as outlined by Mr. Henry Woodhouse of the Aero Club of America has been studied with deep interest and, having been actively associated with the Aircraft Manufacturers in peace and war times and with an intimate knowledge of the many difficulties which they have encountered in the production of aircraft in the past, it appears to me that with the extended use of commercial aeroplanes, the furture for the air craft manufacturers is at the dawning.

The most progressive nations in the world have maintained their position by reason of their commercial enterprise and development. In America, this phase of progress has been overshadowed for the moment by our war time activities which have now reached a stage where some consideration can be given to the advantage of commercial development along lines that will assist the war program. The manufacturers who have been sadly handicapped in their business enterprises by a limited market in pre-war times and a restricted market at the present time, will have something to look forward to in the manufacture of commercial aeroplanes, and should now be seriously contemplating "stock products" with a view to actually engaging in commercial work.

With the advent of the Aerial Mail Service as a forerunner of the commercial expansion of the United States and the fact that the Standard Aircraft Corporation of Elizabeth, New Jersey, was the first of the American Aircraft Manufacturers to design, construct and deliver aeroplanes, especially for this service, we have conclusive evidence of already having placed the aircraft industry on a commercial basis; it being reasonable to predict that what one company has accomplished, as a pioneer in the commercial field, that other similar organizations can do also, and more easily now that the way has been opened for them.

The United States is depended upon by the civilized world to support the conduct of the war and, it is obvious that the commercial expansion within our own borders should concurrently parallel our war work in order that it, too, may be efficient.

Italy has numerous air routes in daily operation for mail, express and contact service with her air forces, using the Caproni type of machine flown on schedule time and covering practically every part of the country. This type of machine has been duplicated in America and successfully flown at its first trial.

France was highly active in the development of the high speed aeroplanes and has always been at the front in the progressive science of aeronautics.

England has astonished the world by the size of her aircraft, the great weights carried and the long distances that they have traveled in order to render a service urgently needed.

Austria has already established Aerial Mail routes and is employing them as means of close communication between strategic points, thus relieving the railway and wire service.

Germany has copied the English Handley Page type of machines which are now made in America and has in the past been extremely active in the commercial development of the air service.

America's opportunity to establish a commercial air service will never be more advantageous. Her manufacturers have been able to successfully reproduce the leading types of aircraft of England, France and Italy and at the first trial, the flights of these machines have been successful. The past three years' experience of the countries have established a fund of accurate information relating to aircraft design and service upon which we can draw, and, by the experiences of the friendly nations, we will be able to pass rapidly through the difficult pioneer period without loss of time or energy due to experimentation with a hitherto unknown quantity.

Within the next six months, many additional routes for mail carrying should be in active operation. The equipment necessary to carry out this work can fairly be expected to be released from the war work, since commercial aeroplanes will aid materially the war program in securing a closer contact with bases of supplies in this country and shortening the time of communication between manufacturing and administrative centres.

It has already been demonstrated that the manufacturers can build the commercial type of aeroplanes in rapid time and fly them from their factories and from the performances of the Aerial Mail Service, it is evident also that commercial aeroplanes can be economically operated, and on a business basis.

To adequately prepare for the commercial expansion of the future, it is now opportune for the Government to release for this service raw materials in sufficient quantities to construct the commercial aeroplanes and to permitt he aeroplane manufacturers to divert a part of the present organization to commercial use and to utilize their war experience, in order to meet the demands that will be made upon them in the commercial field.

However rapid the future developments of the commercial Aerial Service may take place, the aircraft manufacturers and the allied industries can be relied upon to meet its requirements and with their co-operation and by their coordination of effort, now already completely established by reason of the war, will be able to take an active part in placing America in the foremost ranks of the civilized nations and maintain that supremacy through the intensive development of peaceful pursuits.

THE ZEPPELIN BOMBING BIPLANE

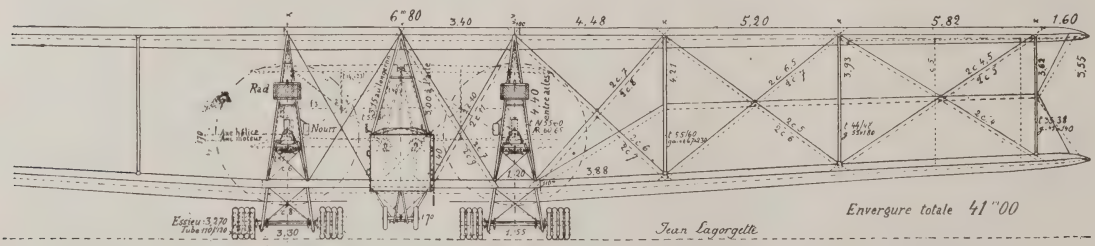
THROUGH the courtesy of *L'Aerophile* we are enabled to present outline drawings of the large Zeppelin bombing machine which was brought down on the Western Front south-east of Soissons. It is equipped with four Maybach engines delivering a total of 1200 horsepower. Each motor is independent. All are placed at the same level and in pairs. They are set up one behind the other. The front ones are tractors and the rear ones are pushers. Being of the same type they revolve in opposite directions because of this, thereby neutralizing the torque. The same idea was advanced and tried out in France in 1916. Each motor is placed between the two legs of the cockpit AR and AV. Half of the length on the motor is placed behind these legs and half ahead of them. Each of the platforms to which they are bolted is a beam made of two pieces of wood with a small strip laid in between vertically.

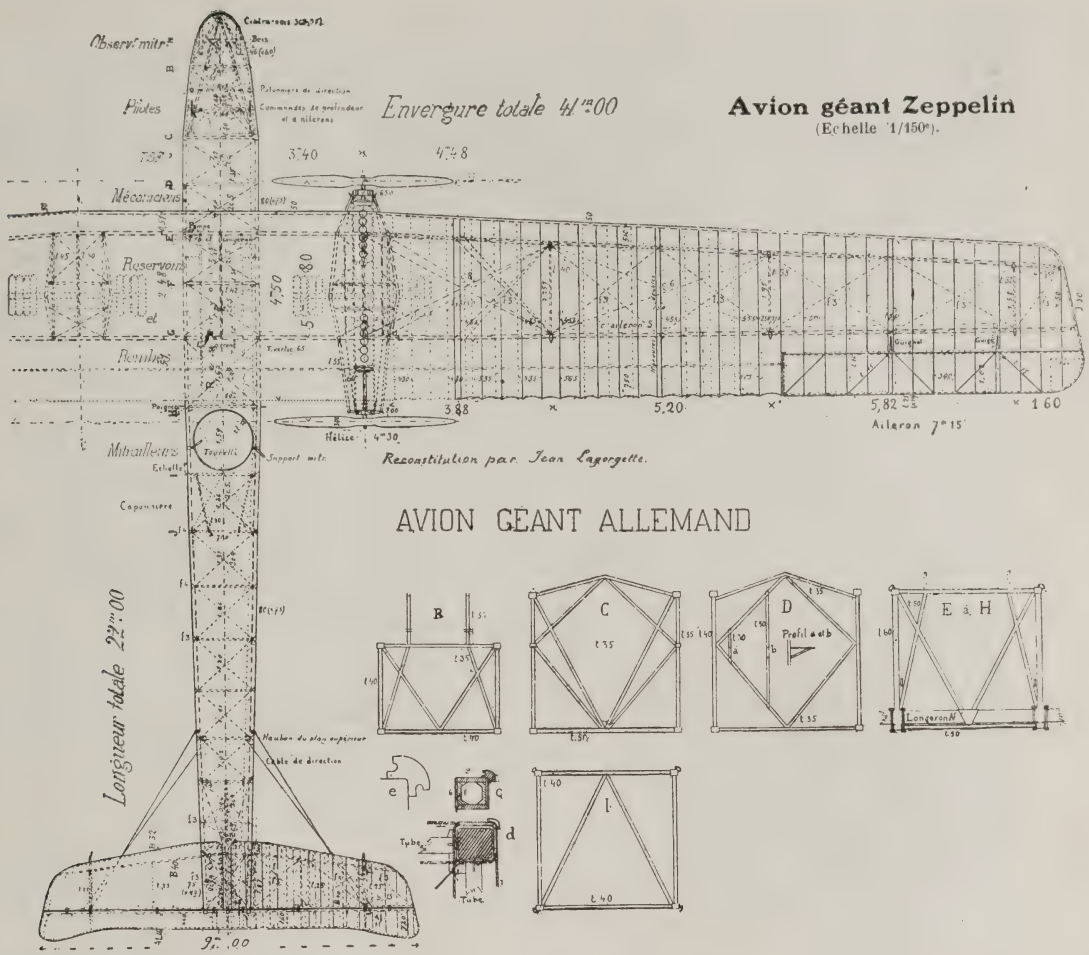
The fuselage, as in the smaller types, is unique. It shows the general characteristics of the old German fuselage, and not as the new ones which have wooden frames. The length is 21 meters, 35 centimeters.

Ailerons

As on all German biplanes except the Albatros C.X. and Friedrichhafen types this machine does not have ailerons on the upper wings. Although the third longeron has a shape like a gutter to receive it it is a matter of certain fact that the third longeron is not used as a bearing and the machine does not have ailerons on the lower wings.

The total wing spread is 41 meters, while the total length is 22 meters.





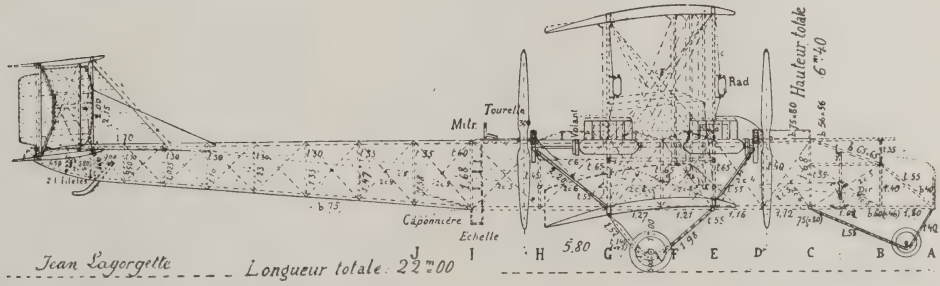


FIG. 3 et 4. — **Avion géant Zeppelin.** — Echelle 1/150e. — *al.* duralumin: *b.* bois; *c*, câble; *f.* fil d'acier; *g*, gaine; *t*, tube. — Vue de face des tirets indiquent le dessous du longeron A R, son haubannage, ainsi que les gouvernes.

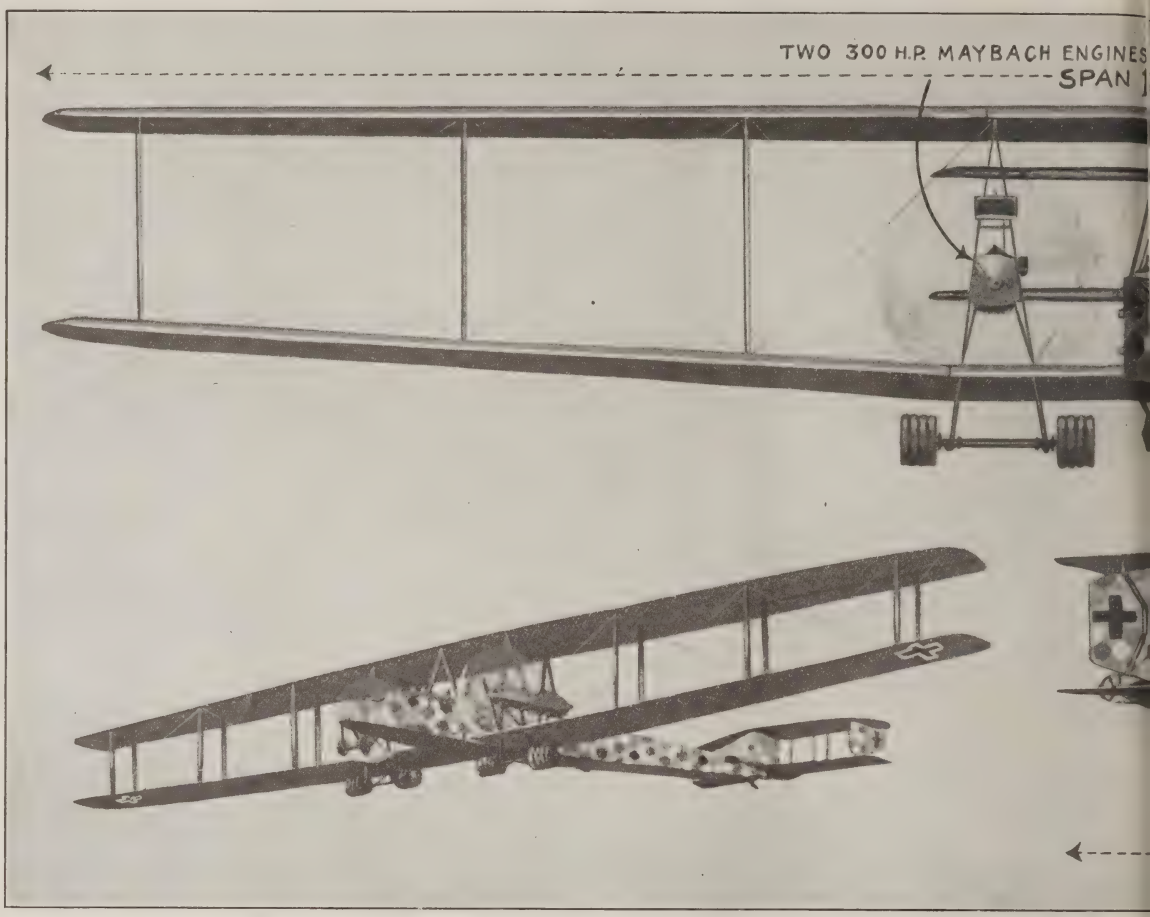
GIANT ZEPPELIN AEROPLANE

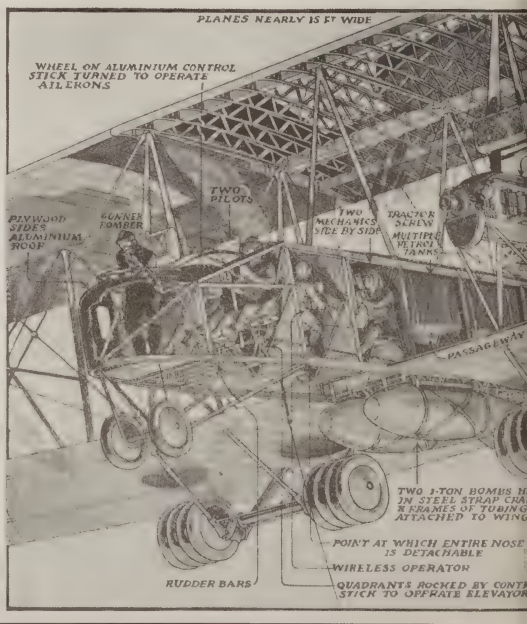
al—duralumin; b—wood; c—cable; f—steel cable; g—sheath; t—tubing.



The ribs of the lower wings and lower elevators are shown in dotted lines, also the rudders. To the left and out of the fuselage figures three and four show the diameter of the transversal struts. The upper wings are in reality 45cm. out of center. B and I are transversal frames. In G frame the wing longeron is placed somewhat underneath the position it occupies in E and it replaces the tube cross bracing above frames E to H. The dotted lines indicate longitudinal beams. c is the sectional longeron of the fuselage. e is a section of the corner angle of the fuselage in the angle of the longeron

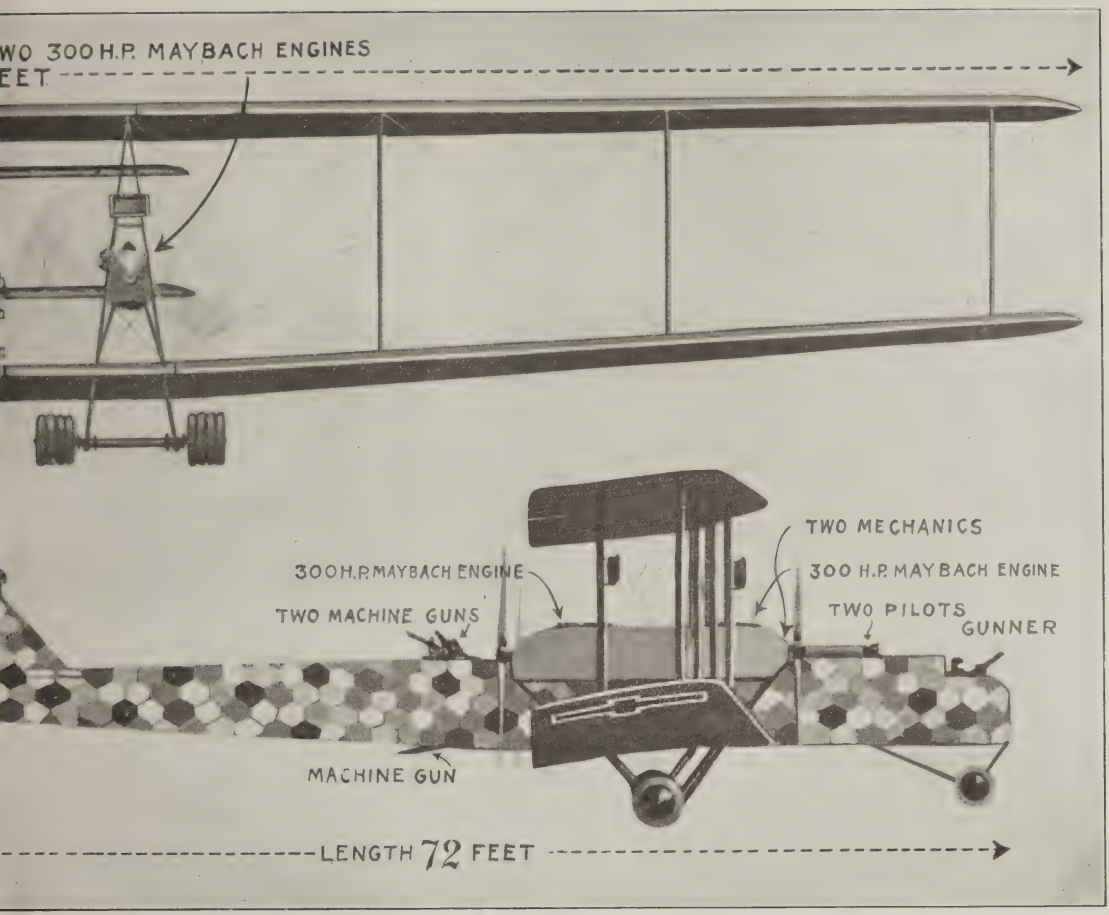
A side view of the Zeppelin Bomber. The upper wings are really out of center at the rear about 45 cm. The angle of incidence is such that the struts are at right angles to the chord. The propeller and motors are about 12 cm. back. The ribs of the central section are extended into the legs of AR of the cockpit. There are two elevators in similar directions and the central section comprises a large triangle besides the lateral planes, the inside apex of which forms a semi-ellipse. The parts B-A in the sketch may be taken to pieces without spoiling the main part of the machine

THE NEW FOUR-MOTO

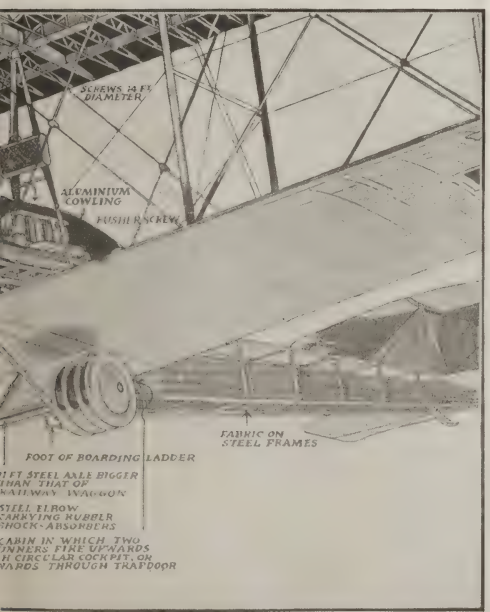


THE ZEPPELIN BOMBING BIPLANE

Through the courtesy of L'Aerophile we are enabled to present outline drawings of the large Zeppelin bombing machine which was brought down on the Western front southeast of Soissons. It is equipped with four Maybach engines delivering a total of 1200 horsepower.



The fuselage, as in the smaller types, is unique. It shows the general characteristics of the old German fuselage, and not as the new ones, which had wooden frames. The length is 21 meters 35 centimeters.



As on all German biplanes, except the Albatros C.X. and Friedrichshafen types, this machine does not have ailerons on the upper wings.

The total wing spread is 41 meters, while the total length is 22 meters.

D ZEPPELIN BOMBER

THE NEW GERMAN AEROPLANES

A despatch from the British front in France reports the appearance in a bombing raid over the Allied line in the St. Quentin sector of a number of German aeroplanes of huge size, carrying bombs "thirteen feet long, which contained 2,000 pounds of explosives." This is evidently the new Zeppelin bomber to which the German military authorities referred in connection with their plans for the building of "monster submarines" and giant long-distance guns, and which is illustrated herewith.

THERMODYNAMIC CYCLES IN INTERNAL COMBUSTION ENGINES

With Particular Reference to Aircraft Requirements

By WM. J. WALKER, B. Sc., A. M. I. C. E.

(With twelve line illustrations)

SIR DUGALD CLERK, in a recent paper,* gave it as his opinion that "British engineers and scientific men are still convinced that other methods must be found of increasing power in internal combustion engines than mere increase of dimensions of cylinders and massive construction of parts as practised in Germany." The recent paper on "The Possibilities of the Constant Pressure Cycle" read before the Society of Automobile Engineers of America, and printed in the July, 1916, number of *The Automobile Engineer*, is evidence of the prevailing feeling that a *cul de sac* is being approached, although, perhaps, the direction indicated by the authors of the paper in question would appear to lead to nothing more than another such blind alley in a much less prosperous neighborhood.

The three most obvious methods by which increase of power may be obtained are:

(1.) An increase of the mean effective pressure of the cycle.

(2.) An increase of engine speed.

(3.) An increase of the number of working strokes per revolution.

The second of these, perhaps, has not been so fully utilized as it might be, but its limitations are certainly well recognized. The third is typified by the many endeavors to produce a successful two-stroke motor. It is upon the first method of obtaining increased power that the main ideas of the following notes are based. For the purpose of this investigation thermodynamic cycles will be divided into two main classes, designated types A and B.

The Dual Combustion Cycle, Type A

This is shown graphically in fig. 1. It will be noticed that part of the heat of combustion is developed first at constant volume, and the remainder at constant pressure, hence the term "dual combustion." All the heat rejected is rejected at constant volume. The best example of an engine operating successfully on this cycle is the Blackstone heavy oil engine.

In fig. 1,

Let r = compression ratio $= \frac{v}{v_0}$

ρ = cut-off ratio $= \frac{v_2}{v_1}$

α = explosion ratio $= \frac{p_1}{p_0}$

and γ = the adiabatic constant = (1.4 for air).

The efficiency of the cycle is then given by

$$\eta = 1 - \frac{1}{r^{\gamma-1}} \left(\frac{\alpha \rho^{\gamma} - 1}{(\alpha - 1 + \gamma \alpha (\rho - 1)} \right) \quad (1)$$

If $\rho = 1$, the expression (1) gives the efficiency of the constant volume cycle in its well-known form:

$$\eta_t = 1 - \frac{1}{r^{\gamma-1}}$$

If $\alpha = 1$, (1) gives the expression for the cycle on which the Diesel engine operates, *i.e.*,

$$\eta_t = 1 - \frac{1}{r^{\gamma-1}} \left(\frac{\rho^{\gamma} - 1}{\gamma (\rho - 1)} \right)$$

The mean effective pressure of Type A is given by

$$p_m = \eta_t \, p \left(\frac{r^{\gamma} (\alpha - 1) + \gamma \alpha (\rho - 1)}{(r - 1) (\gamma - 1)} \right) \quad (2)$$

where p is the pressure at the beginning of compression.

If $\rho = 1$, this gives for the mean effective pressure of the constant volume cycle

$$p_m = \eta_t \, p \, \frac{r^{\gamma} (\alpha - 1)}{(r - 1) (\gamma - 1)}$$

If $\alpha = 1$, as in the Diesel cycle, then

$$p_m = \eta_t \, p \, \frac{\gamma r^{\gamma} (\rho - 1)}{(r - 1) (\gamma - 1)}$$

The convenience and simplicity of the expressions thus obtained for calculating the thermal efficiency and mean effective pressure for different values of p, a, and r are apparent, since *temperature values* are entirely eliminated.

* *Journal of the Royal Society of Arts*, December, 1916.

The Dual Combustion Cycle, Type B

This is shown graphically in fig. 2. It is similar to type A, except that the heat is rejected at constant pressure instead of constnat volume. There is no internal combustion engine of any kind of which the writer is aware which operates on this cycle. It is introduced here because of many interesting points which are revealed by examination of the cycle from a thermodynamic standpoint. This interest is not merely because of the theoretical points which will appear, but also because of its practical bearing on the subjects of complete expansion and compounding for internal combustion engines. It is, of course, obvious that this cycle must have a lower mean effective pressure than the one previously discussed.

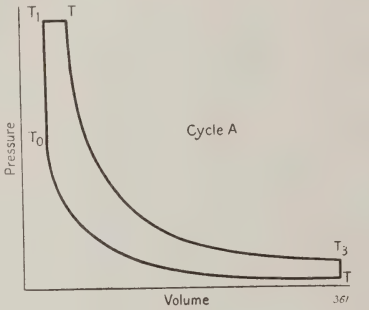


Fig. 1.

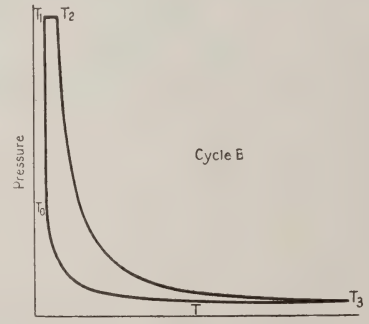

Fig. 2.

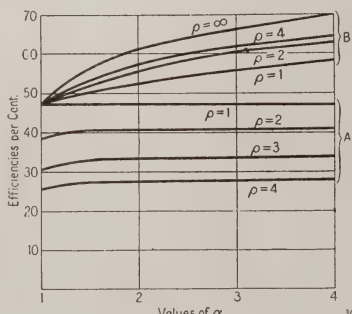

Fig. 3.

The thermal efficiency of the cycle is given by

$$\eta_t = 1 - \frac{1}{r^{\gamma-1}} \left(\frac{\gamma (\alpha^{\frac{1}{\gamma}} \rho - 1)}{(\alpha - 1) + \gamma \alpha (\rho - 1)} \right) \quad (3)$$

If $\alpha = 1$, (3) becomes the expression for the constant pressure cycle, which, as is well-known, is the same as for the constant volume cycle, *i.e.*,

$$\eta_t = 1 - \frac{1}{r^{\gamma-1}}$$

If $\rho = 1$, the efficiency is

$$\eta_t = 1 - \frac{1}{r^{\gamma-1}} \quad \frac{\alpha^{\frac{1}{\gamma}} - 1}{\alpha - 1} \left(\frac{\alpha^{\frac{1}{\gamma}} - 1}{\alpha - 1} \right)$$

This example of type B (*i.e.*, when $\rho = 1$) is the cycle designated type 3 by Clerk in his book "The Gas, Petrol, and Oil Engine."* The expression for the efficiency given there is

$$\eta_t = 1 - \gamma \frac{T' - t}{T - t_c}$$

and involves four different temperatures in the cycle. This is pointed out to indicate the advantage of casting the expressions into the forms given here, temperature values not being involved.

The mean effective pressure of type B is given by

$$p_m = \eta_t \, p r^{\gamma} \left(\frac{(\alpha - 1) + \gamma \alpha (\rho - 1)}{(\alpha^{\frac{1}{\gamma}} \rho r - 1) (\gamma - 1)} \right) \quad (4)$$

which, for the constant pressure cycle with $\alpha = 1$, becomes

$$p_m = \eta_t \, p r^{\gamma} \frac{\gamma (\rho - 1)}{(pr - 1) (\gamma - 1)}$$

For $\rho = 1$

$$p_m = \eta_t \, p r^{\gamma} \left(\frac{\alpha - 1}{(\alpha^{\frac{1}{\gamma}} - 1) (\gamma - 1)} \right)$$

Comparison of Types A and B

From the formulæ (1) to (4) thus obtained, the thermal efficiencies and mean effective pressures in types A and B have been plotted in figs. 3 to 6 against values of α and ρ and on the basis of a compression ratio $r = 5$, γ being assumed = 1.4. The conclusions to be arrived at will clearly be quite independent of the values thus arbitrarily chosen. Figs 3 and 4 show the variation of thermal efficiency of the two cycles with α and ρ, while figs. 5 and 6 show the variation of mean effective pressure with the same quantities.

The first point to be noted is that the efficiency of type A increases with an increase of α, representing constant volume combustion, but is diminished by an increase of ρ, representing constant pressure combustion. In type B the efficiency increases with both α and ρ. This difference in the effect of constant pressure combustion upon the efficiencies of the two types is interesting. A glance at figs. 5 and 6 shows that, as far as mean effective pressures are concerned, type A has all the advantages.

For purposes of comparison, four particular cases of the two types of cycle will now be investigated, each with the same maximum pressure of 545 lb. per sq. in. All the cases are represented in fig. 7.

CASE 1.—This is an example of type B with $r = 1$, $\rho = 2$, and $\alpha = 36.3$, and is represented by the area FABCF. Its efficiency $\eta_t = 59.3\%$.

CASE 2.—Type B with $r = 13$, $\rho = 2$, and $\alpha = 1$. This is represented by the area FEBCF. Its efficiency $\eta_t = 64.1\%$.

CASE 3.—Type A with $r = 13$, $\rho = 2$, and $\alpha = 1$. This is represented by the area EBCDE, and is an example of the cycle on which the Diesel engine is operated. Its efficiency $\eta_t = 58.2\%$.

Attention is drawn here to the fact that the difference in efficiency between cases 2 and 3 is 5.9%, expressed as a percentage of the total heat supplied. This will be observed to be due entirely to the difference between the work areas in the two cases represented by the area DEF in fig. 7.

CASE 4.—The same as case 1, with the omission of the area DEF. Its efficiency $\eta_4 = 55.5\%$.

Comparing the two cases 3 and 4, it appears that from $r = 1$ to $r = 13$ the difference in efficiencies is only 2.7%.

The relative possibilities of operating these cycles in practice have no bearing on the argument which follows.

The important point to be noted is the relative value of the area DEF to the total work obtained. It is evident that the smaller the compression ratio r, the less will be the relative value of the area DEF to the whole area. It is for this reason that the diminution in efficiency between cases 3 and 4, where $r = 13$ and $r = 1$ respectively, is only 2.7%. In such a cycle, therefore, the compression ratio would be chosen, not at all from the point of view of efficiency to be obtained, but from its likely effect upon the reliable working of the engine. In other words, *although increase of compression ratio generally increases the efficiency of any cycle, some other portion of the cycle (such as the constant pressure combustion process in type B) may exert such an influence as to render the effect of compression ratio upon the efficiency negligible.*

It is usual to look upon compression ratio as the theoretical limiting factor in the attainment of a high efficiency. This is partly a contradiction of the old scientific principle deduced from Carnot's cycle—that efficiency depends upon wide temperature limits. The fact that both principles are true under the assumptions proper to each evidently indicates that there must be some compromise between them. Such a compromise is indicated in type B, where the advantages of both principles may be retained without the intervention of the disadvantages due to too extreme an application of either.

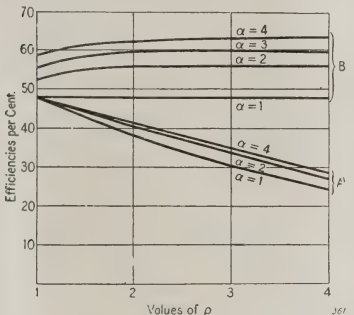

Fig. 4.

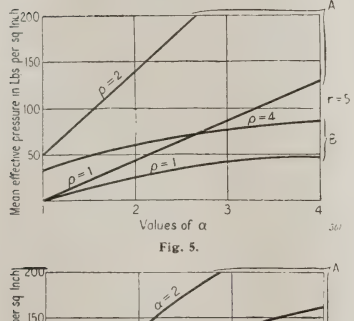

Fig. 5.

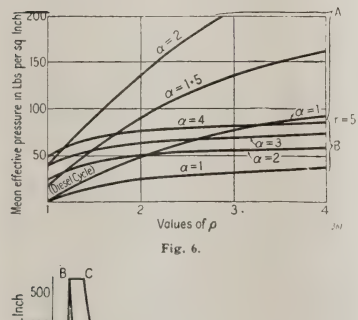

Fig. 6.

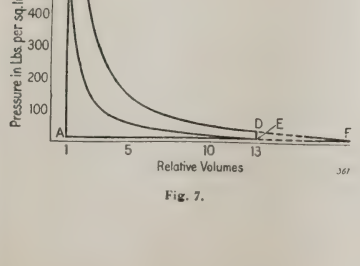

Fig. 7.

For the purpose of considering these types further with regard to their application to aero engines, the power requirements of aeroplanes will be dealt with briefly.

Power Required for Flight

In order to obviate the necessity of going into a close investigation of the theoretical aspect of this question, the writer has constructed a series of graphs calculated from reliable data. The graphs are based upon the requirements of two aeroplanes of equal total weight but of different wing loadings, the two values chosen for the latter being 8.5 and 4.7 lb. per sq. ft. of wing area. The ratio of *supporting area* A to the *equivalent normal* area a is assumed to be = 60. The first graph is shown in fig. 8, which gives the thrust-speed relationship for the two machines during horizontal flight, showing minimum thrust values at speeds of 83.5 and 107.5 miles per hour. These are evidently the speeds which give the *least fuel consumption for flights of given range,* or the *least energy speeds.* Fig. 9 shows the corresponding power speed graphs. These indicate at a glance the difference between the power requirements of heavily and lightly loaded machines. At high speeds the power required by the lightly loaded machine becomes excessive, and the reason for this is obvious. Both machines have the same total overall weight of 2,210 lb., so that the lightly loaded machine, presenting, as it does, a large surface area to the wind currents, will experience, while attaining the higher speeds, a rapidly increasing head and skin resistance which will eventually cause an absorption of power largely in excess of what would be required to propel the heavily loaded machine of the same total overall weight. Minimum power is required in the two cases at speeds of 61 and 81 miles per hour with the light and heavy loading respectively. These are the speeds which give *least fuel consumption for flights* of given duration of time, or *least power speeds.*

Adaptability of Power Available to Power Required

In fig. 10 is shown in the full line graph, convex upwards, a characteristic power curve of an engine and propeller plant, while the other full line curve, concave upwards, is the power speed graph of the machine whose loading is 4.7 lb. per sq. ft., derived from fig. 9. Fig. 11 gives the same engine power graph in conjunction with the required power graph of the machine whose loading is 8.5 lb. per sq. ft.

At first sight it would seem that the lightly loaded machine appears to lend itself to a slightly wider range of flying speeds with a given power unit than is possible with the heavily loaded machine. The difference in this respect between the two cases chosen is given by the ranges comprised between the vertical dotted lines in each case. On the other hand, however, referring first to fig. 10, the limiting speeds there of 59 and 107 miles per hour correspond at that particular loading to angles of incidence of 6.6° to 2°, the lower limiting angle being therefore beyond the generally accepted danger limit of 3°. In order to bring the whole machine within safe limits of operation, a smaller powered motor is necessary, or else the pilot, if he wishes to attain the horizontal speed of 90 miles per hour, which corresponds in this case to the limiting angle of 3°, must perform the double operation of opening the throttle and setting the angle of incidence of his machine to suit. If a smaller powered motor is installed, the inclusion of the characteristic power speed graph of such a system shown dotted in fig. 10 reveals how the speed range has been reduced when the intersecting point of the two graphs at the higher speed corresponds to the limiting safe angle of incidence. In fig. 11, again, the limiting speeds of horizontal flight there are about 73 and 114 miles per hour, corresponding to angles of incidence of 3½° to 8°, both within safe limits. Hence, in this case, a higher powered motor can be safely installed such as that, the power speed graph of which is represented by the dotted line, giving the much wider speed range shown. The crosses in figs. 10 and 11 indicate the position of the least energy speeds, and it is obvious that the intersecting point of the two graphs at the higher speeds should be at, or as nearly as possible to, this value, so that the normal speed of the aeroplane, with the engine at full power, will take place, as nearly as possible, under the least energy conditions. This condition is more nearly met by the heavily loaded machine. It may be argued that a more favorable correspondence between the available and required power of the lightly loaded machine could be obtained than has been depicted here in fig. 10. On the whole, however, it will be found that the balance of advantage in this respect lies with the heavily loaded machine.

Types A and B in Their Relation to Adaptability

Although it is absolutely necessary to obtain the minimum of weight in all parts of the structure which go to make up an aeroplane, it does not necessarily follow that, in the case of the power unit, the engine working on a cycle with the greatest mean effective pressure is to be preferred without qualification. The question of efficiency intervenes to upset such a notion, and it is quite clear that in any case of prolonged flight, such as the Transatlantic project, the efficiency must easily play the predominating part. For machines whose sole purpose is quick climbing during short flights only, an engine with a high mean effective pressure is essential. From these two extreme cases it is evident that there is much room for compromise, and this compromise may be stated in terms of the relation between engine weight and efficiency, as has been done already by the writer in another place. This

THIRD ANNUAL REPORT OF THE NATIONAL ADVISORY COMMITTEE ON AERONAUTICS

IN accordance with the provisions of the act of Congress approved March 3, 1915, establishing the National Advisory Committee for Aeronautics, the committee submits herewith its third annual report.

This report reviews the activities of the committee during the past year, the work accomplished in the study of scientific problems, the assistance rendered by the committee in connection with aerial preparedness for war and in the development of the aircraft industry to meet the demands of the Government, and contains a statement of expenditures, estimates for the fiscal year 1919, and certain recommendations for the consideration of Congress. Technical reports covering the various subjects under investigation during the past year are submitted as appendixes.

The National Advisory Committee for Aeronautics

The National Advisory Committee for Aeronautics was established by Congress by act approved March 3, 1915. Under the law the committee is charged with the supervision and direction of the scientific study of the problems of flight with a view to their practical solution, the determination of the problems which should be experimentally attacked, their investigation and application to practical aeronautics. The committee is also authorized to direct and conduct research and experiment in aeronautics in such laboratory or laboratories, either in whole or in part, as may be placed under its direction.

The committee has 12 members appointed by the President. As authorized by Congress, the personnel of the committee consists of 2 members from the War Department, from the office in charge of military aeronautics; 2 members from the Navy Department, from the office in charge of naval aeronautics; a representative each of the Smithsonian Institution, of the United States Weather Bureau, and of the United States Bureau of Standards; and not more than 5 additional persons acquainted with the needs of aeronautical science, either civil or military, or skilled in aeronautical engineering or its allied sciences.

During the past year the two naval members of the committee, Capt. Mark L. Bristol, United States Navy, and Naval Constructor Holden C. Richardson, United States Navy, the latter being also secretary of the committee, resigned on account of transfer to duty away from Washington; and Brig. Gen. George B. Scriven, United States Army, resigned on account of retirement. To fill the vacancies thus occasioned, the President appointed the following members: Rear Admiral D. W. Taylor, Chief Constructor, United States Navy; Lieut. Commander J. H. Towers, United States Navy; and Lieut. Col V. E. Clark, Signal Corps. Dr. S. W. Stratton succeeded Naval Constructor Richardson as secretary.

The organization of the Advisory Committee as of October 4, 1917, the date of the annual meeting, is as follows:

Dr. William F. Durand, chairman.
Dr. S. W. Stratton, secretary.
Dr. Charles D. Walcott, chairman, executive committee.
Dr. Joseph S. Ames.
Lieut. Col. V. E. Clark, United States Army.
Prof. John F. Hayford.
Prof. Charles F. Marvin.
Hon. Byron R. Newton.
Dr. Michael I. Pupin.
Maj. Gen. George O. Squier, United States Army.
Rear Admiral David W. Taylor, United States Navy.
Lieut. Commander John H. Towers, United States Navy.

The annual meetings of the Advisory Committee are held in October and the semi-annual meetings in April. The present report includes the activities of the committee between the annual meeting held on October 5, 1916, and that held on October 4, 1917.

Amendments to Regulations

At the semi-annual meeting on April 19, 1917, the regulations were amended to provide:

That the secretary be not ex-officio member and secretary of the executive committee as had formerly been the case, but that the executive committee elect its secretary by ballot to serve for one year.

That the executive committee, in addition to the seven members elected by ballot, should include further any member of the Advisory Committee not otherwise a member of the executive committee but resident in or near Washington and giving his time wholly or chiefly to the special work of the committee.

That the members and employees of the Advisory Committee and of all sub-committees may be allowed traveling expenses and $4 per diem in lieu of subsistence while traveling under orders of the committee on official business.

That the executive committee shall appoint a special disbursing agent for such funds as may be appropriated for the use of the Advisory Committee and that the chairman, or acting chairman, of the executive committee shall approve all accounts for the disbursement of funds.

That amendments may be made by a two-thirds vote by letter ballot or at a special meeting, subject to approval by the President, and need not necessarily wait upon stated meetings for consideration.

The Executive Committee

For carrying out the work of the Advisory Committee the regulations provide for the election annually of an executive committee, to consist of seven members, and to include further any member of the Advisory Committee not otherwise a member of the executive committee, but resident in or near Washington and giving his time wholly or chiefly to the special work of the committee. The executive committee, as organized on October 9, 1917, is as follows:

Dr. Charles D. Walcott, chairman, Secretary, Smithsonian Institution.
Dr. S. W. Stratton, secretary, Director, Bureau of Standards.
Dr. Joseph S. Ames, physicist, Johns Hopkins University.
Prof. Charles F. Marvin, Chief, United States Weather Bureau.
Dr. Michael I. Pupin, physicist and electrical engineer, Columbia University.
Maj. General George O. Squier, Chief Signal Officer, United States Army.
Rear Admiral D. W. Taylor, Chief Constructor, United States Navy.
Dr. W. F. Durand, chairman, National Advisory Committee for Aeronautics, additional member.

The executive committee, in accordance with the general instructions of the Advisory Committee, controls the administration of the affairs of the committee and exercises general supervision over all arrangements for research and other matters undertaken or promoted by the Advisory Committee. It keeps written records of all transactions and expenditures and submits an annual report to the Advisory Committee, the details of which furnish the material for the present report.

The executive committee held regular monthly meetings throughout the year, and in addition, held 13 special meetings on the following dates:

Regular meetings.—October 12, 1916; November 9, 1916; December 7, 1916; January 11, 1917; February 10, 1917; March 8. 1917; April 12, 1917; May 10, 1917; June 14, 1917; July 12, 1917; August 9, 1917; September 13, 1917.

Special meetings.—October 9, 1916; November 23, 1916; February 1, 1917; February 3, 1917; February 4, 1917; March 22, 1917; March 29, 1917; April 5, 1917; April 10, 1917; April 23, 1917; May 26, 1917; September 27, 1917; October 2, 1917.

The committee has organized the necessary small clerical and technical staffs. All work is performed under the personal supervision of one or more officers of the committee. An assistant secretary, who also serves as special disbursing agent, has charge of the office, records, and property of the committee.

Subcommittees

The following subcommittees organized under the executive committee have greatly facilitated the work of the committee during the past year. Under proovision of the regulations for the conduct of the work of the committee the membership of subcommittees is not limited to members of the Advisory Committee. The committees marked with an asterisk have been superseded or discharged:

*AERIAL MAIL SERVICE:
Maj. Gen. George O. Squier, United States Army, chairman.
Prof. Charles F. Marvin.
Dr. S. W. Stratton.
Lieut. Col. V. E. Clark, United States Army
Lieut. Commander J. H. Towers, United States Navy.

AERO TORPEDOES:
Lieut. Commander J. H. Towers, United States Navy, chairman.
Lieut, Col. V. E. Clark, United States Army.

AIRCRAFT COMMUNICATIONS:
Dr. Michael I. Pupin, chairman.
Dr. Joseph S. Ames.
Dr. S. W. Stratton.
Dr. E. B. Rosa.

AEROPLANE MAPPING COMMITTEE:
Maj. Gen. George O. Squier, United States Army, chairman.
Dr. Charles D. Walcott.
Capt. J. W. Bagley, Engineer Officers' Reserve Corps.
Carl G. Fisher.

BIBLIOGRAPHY OF AERONAUTICSS
Prof. Charles F. Marvin chairman.
Dr. Joseph S. Ames.

BUILDINGS, LABORATORIES, AND EQUIPMENT:
Dr. S. W. Stratton, chairman.
Dr. Joseph S. Ames.
Dr. W. F. Durand.
Lieut. Col. V. E. Clark, United States Army.
Lieut. Commander J. H. Towers, United States Navy.

CIVIL AERIAL TRANSPORT:
Dr. W. F. Durand, chairman.
Dr. S. W. Stratton.
Prof. Charles F. Marvin.
Lieut. Col. V. E. Clark, United States Army.
Lieut. Commander J. H. Towers, United States Navy.

DESIGN, CONSTRUCTION, AND NAVIGATION OF AIRCRAFT:
Maj. Gen. George O. Squier, United States Army, chairman.
Dr. Joseph S. Ames.
Lieut. Commander J. H. Towers, United States Navy.
Lieut. Col. V. E. Clark, United States Army.
Dr. A. F. Zahm, secretary.
Frederick Alger.
M. D. Hersey.
J. H. Nelson.
Aeronautic instruments—
Dr. Joseph S. Ames, chairman.
Commander W. T. Jewell, United States Navy.
M. D. Hersey.
Maj. C. E. Mendenhall, Signal Corps.
Dr. Lyman Briggs.

EDITORIAL:
Dr. Joseph S. Ames, chairman.
Dr. S. W. Stratton.
Dr. W. F. Durand.

*FOREIGN REPRESENTATIVES:
Dr. Charles D. Walcott, chairman.
Maj. Gen. George O. Squier, United States Army.
Rear Admiral D. W. Taylor, United States Navy.

FREE FLIGHT TESTS:
Prof. John F. Hayford, chairman.
Dr. W. F. Durand.
Dr. S. W. Stratton.
Lieut. Col. V. E. Clark, United States Army.
Prof. A. Klemin.
Dr. Lyman Briggs.
Dr. A. F. Zahm.
Lieut. G. P. Thomson, R. F. C.

GOVERNMENTAL RELATIONS:
Dr. Charles D. Walcott, chairman.
Dr. S. W. Stratton.

HELICOPTER, or DIRECT-LIFT AIRCRAFT:
Dr. W. F. Durand, chairman.
Dr. Michael I. Pupin.
M. B. Sellers.
Dr. A. F. Zahm.
Prof. E. B. Wilson.

NOMENCLATURE FOR AERONAUTICS:
Dr. Joseph S. Ames, chairman.
Dr. S. W. Stratton.
Maj. Gen. George O. Squier, United States Army.
Capt. Mark L. Bristol, United States Navy.
Navy Constructor H. C. Richardson, United States Navy.

*PATENTS:
Dr. Charles D. Walcott, chairman.
Dr. S. W. Stratton.
Lieut. Commander J. H. Towers, United States Navy.
S. D. Waldon.
Frederick P. Fish.
W. Benton Crisp.
Dr. W. F. Durand.

*POLICY:
Prof. John F. Hayford, chairman.
Dr. Joseph S. Ames.
Dr. S. W. Stratton.

POWER PLANTS:
Dr. S. W. Stratton, chairman.
Maj. Gen. George O. Squier, United States Army.
Dr. W. F. Durand.
Lieut. Commander J. H. Towers, United States Navy.
Dr. H. C. Dickinson, secretary.
Prof. J. C. Riley.
Prof. E. Newcomb.
Lieut. Commander A. K. Atkins, United States Navy.

*QUARTERS:
Dr. S. W. Stratton, chairman.
Maj. Gen. George O. Squier, United States Army.

*RADIATOR DESIGN:
Naval Constructor H. C. Richardson, United States Navy, chairman.
Dr. S. W. Stratton.
Maj. Henry Souther.

RELATION OF THE ATMOSPHERE TO AERONAUTICS:
Prof. Charles F. Marvin, chairman.
Dr. Joseph S. Ames.
Prof. John F. Hayford.
Lieut. Commander J. H. Towers, United States Navy.

*SITE FOR EXPERIMENTAL FIELD:
Dr. Charles D. Walcott, chairman.
Prof. Charles F. Marvin.
Dr. S. W. Stratton.

SPECIAL COMMITTEE ON ENGINEERING PROBLEMS:
Dr. W. F. Durand, chairman.
Dr. S. W. Stratton.
Dr. A. F. Zahm.
Dr. H. C. Dickinson.
Herbert Chase.
Grover C. Loening.

STANDARDIZATION AND INVESTIGATION OF MATERIALS:
Dr. S. W. Stratton, chairman.
Dr. Joseph S. Ames.
Maj. Gen. George O. Squier, United States Army.
Dr. W. F. Durand.
Prof. John F. Hayford.
Naval Constructor J. C. Hunsaker, United States Navy.
J. H. Nelson.
E. D. Walen.
Light alloys—
Dr. G. K. Burgess, chairman.
Naval Constructor J. C. Hunsaker, United Navy.
Charles M. Manly.
E. Blough.
Z. Jeffries.
Prof. C. H. Mathewson.

STEEL CONSTRUCTION FOR AIRCRAFT:
Dr. W. F. Durand, chairman.
Dr. S. W. Stratton.
Dr. A. F. Zahm.
F. G. Diffin.
W. B. Stout.
J. H. Nelson.
H. L. Whittemore.
J. W. Smith.
Jesse Coates.

Quarters for Committee

The office and headquarters of the committee are located in rooms 515-519 Munsey Building, Washington, D. C. The technical work of the committee, performed largely by or under the direction of the various subcommittees, is carried out in various laboratories and shops belonging to the Government and universities of learning whose facilities for scientific research are at the disposal of the Government.

To carry on the highly scientific and special investigations contemplated in the act establishing the committee, and which have, since the outbreak of the war, assumed greater importance, and for which facilities do not already exist, or exist in only a limited degree, the committee has contracted for a research laboratory to be erected on the Signal Corps Experimental Station, Langley Field, Hampton, Va. The dimensions of the research laboratory building are 123 by 52 feet. The building is two stories in height, constructed of red brick, with limestone belt courses, coping, and main entrances, including ornamental pediment. In the west half of the building, on the first floor, it is planned to locate a well-equipped machine shop and structural testing laboratory, with a pattern shop directly above the laboratory on the second floor. In the east half of the building, on both floors, it is planned to locate the executive offices, drafting rooms, photographic, physical, and chemical laboratories. The plot of ground on which the building is placed was assigned to the committee by the War Department and will allow the addition of two wings of the same size as the present building. There is also room for two wind tunnels which are contemplated in the near future. An engine test shed will be placed in a convenient location. Authority for the construction of small additional buildings necessary in connection with the laboratory was contained in the urgent deficiency act approved October 6, 1917.

Activities of the Committee in Connection with Preparation of an Aerial Fleet for War

In the latter part of March, 1917, when war with Germany seemed imminent, the committee, in conference with United States military and naval officers and manufacturers of aircraft, reviewed the condition of the aeronautic industry, the facilities then existing in this country for meeting the requirements of the Government, the possibilities of adequate expansion, and the then patent situation and its influence on the aeronautic industry.

A subcommittee was appointed to cooperate with representatives of aircraft manufacturers and to investigate all problems entering into the quantity production of aircraft for the Government. After careful study of the conditions then existing, the Advisory Committee submitted recommendations to the War and Navy Departments for increasing the quantity production of aircraft and urging the adoption of a continuing program of manufacture for the next three years.

In early April the chairman of the executive committee conferred with the Secretary of the Navy and the Secretary of War as to the best method to obtain the most efficient results in the development of aviation and the supply of aircraft for military and naval purposes, stating that the Advisory Committee deemed it desirable to create an aeronautical production board with a civilian head, but not a distinct Government department. This met the informal approval of the two secretaries, and after a thorough study of the problem and in the light of the history of the air services of England and France since the beginning of the war in Europe, the committee recommended to the Council of National Defense that a board be appointed by the Council of National Defense, with the approval of the Secretary of War and the Secretary of the Navy, to be known as the aircraft production board, whose duties would be to consider and deal with the problems arising in connection with the quantity production of aircraft in the United States for military purposes. The committee had previously undertaken a census of the production facilities of manufacturers of aircraft and aeronautic engines, and this information was made available to the aircraft production board at the beginning of its work in April. The Advisory Committee further recommended that the Secretary of War and the Secretary of the Navy appoint a joint technical board of the Army and Navy for determining specifications and methods of inspection for all aircraft requirements for the two services.

Ground Schools for Aviators

Supplementing the recommendations made to the Secretary of War and to the Secretary of the Navy that a continuing program be approved for the production of aircraft, on April 13 the committee recommended to the Council of National Defense that the several problem connected with the establishing of cadet training schools for aviators and with the production of aircraft should be considered together as interrelated problems and should also be considered jointly for the uses both of the Army and Navy.

The committee further, at the suggestion of and in cooperation with the War Department, took the initiative in organizing the several ground or cadet schools for the preliminary training of aviators in this country, and in determining the curriculum and methods of carrying on this instruction.

To this end the committee took under consideration the different methods of training used by Great Britain and France. A special commission was sent to Canada to study the methods of training used at the Camp Borden Military School of Aeronautics at Toronto. The committee called into conference representatives of the War Department, and of six established engineering schools in the United States in connection with the organization of this work. On recommendation of the committee the War Department selected the following six colleges for the establishment of ground-school training in aeronautics: Massachusetts Institute of Technology, Cornell University, Ohio State University, Illinois University, University of Texas, and University of California. Later Princeton University and Georgia School of Technology were added. After the desired organization and program of training had gained preliminary form, the work of further development and routine supervision was taken over by the War Department.

Naming of Flying Fields

In May, 1917, the committee suggested to the Secretary of War that flying fields be named in commemoration of individuals who had rendered conspicuous service or contributed to the development of aeronautics, and recommended that the aviation schools established near Dayton, Ohio; Champaign, Ill.; and Detroit, Mich., be named in honor of Wilbur Wright, Octave Chanute, and Lieut. Selfridge, respectively.

Department of Aeronautics

In connection with the consideration of a bill before Congress for the establishment of a separate department of aeronautics, the War Department, under date of May 16, 1917, asked the committee for a recommendation in the matter. The question was considered at the next meeting of the executive committee, and it was recorded as the sense of the meeting that all parties and governmental agencies connected with the development of the air service of the nation were cooperating in an efficient manner, and that nothing could be gained by the establishment of a department of aeronautics at that time.

Aeronautic Patents

In January, 1917, the War and Navy Departments called the attention of the Advisory Committee to the prohibitive prices of aircraft charged by the various aircraft manufacturers, attributing these prices to the extra item of royalty added by each firm in anticipation of infringement suits by owners of alleged basic aeronautic patents who were then threatening all other aeroplane and seaplane manufacturers with such suits, and causing thereby a general demoralization of the entire industry. After numerous meetings with Government officials, owners of patents, and aircraft manufacturers, extending over a period of several months, the committee recommended the organization of an association among aircraft manufacturers for the purpose of cross-licensing aeronautic patents between the members, such association to be known as the Manufacturers Aircraft Association. The committee cooperated also actively in the determination of the general terms and conditions of this agreement and in securing its adoption by the leading aircraft manufacturers of the country. The question of the legality of this association under the anti-trust statutes of the United States having been raised by the Aeronautical Society of America, the matter was submitted by the Secretary of War to the Attorney General of the United States for his opinion. Under date of October 6, 1917, the Attorney General rendered an opinion "that the association (incorporated), as now constituted, and the cross-license agreement under which it is now operated, are not in contravention of the anti-trust laws of the United States." The purposes in view in the formation of this association and which it is believed has been achieved, are the following:

(1) The prevention of the virtual deadlock with danger of monopoly existing under the patent situation as obtaining previous to its consummation, and the removal of restraint upon the trade operative under the existence of this patent situation.

(2) The settling or avoiding of all litigation, actual and prospective, under the previously existing patent situation.

(3) The opening of the industry to free competition of all aeroplane manufacturers and the opening of all patents held by the membership of the association to equal use and on equal terms.

(4) Provision, as set forth in the articles of agreement, whereby a design originating with a given manufacturer may be put into production and used by another manufacturer with all design data, drawings, specifications, etc., on the payment of a small fee, thus facilitating quantity production of an approved design and stimulating the production of new designs or processes.

(5) The development of financial stability and confidence in the aeroplane industry, thus making possible the financing of the absolutely needed expansion in order to take care of the expected demands.

(6) Reduced cost of aircraft to the Government by reduction of aeroplane royalties payable under all patents made available under the association to an amount less than one-half the figures previously demanded under a part only of these patents.

(7) Broadly speaking, the encouragement of aeroplane production to the highest practicable degree and with reference to the demands of the Government under war conditions.

Information from Europe

In March, 1917, the committee arranged, in conjunction with the National Research Council, for representation on the foreign committee sent abroad by the National Research Council to obtain detailed information on scientific matters of importance in connection with the war, and Dr. J. S. Ames, member of this committee, was appointed such representative.

Associate Members

In order to further develop contact with sources of information from abroad, Lieut. Col. L. W. H. Rees, R. F. C., a member of the British commission, together with Maj. Joseph Tulasne, Capt. Armand de Guiche, and Capt. Amaury de La Grange, of the French Flying Corps and members of the French commission, were made associate members of the committee, and as such attended its meetings, contributing valuable information and suggestions regarding matters with which they were especially familiar.

Sample Forms of Aeroplanes from Europe

In connection with the bringing of sample forms of aeroplanes from Europe for use in developing new designs in the United States, the committee cooperated with the War Department in the search for a site and in arranging for the construction of a suitable building.

Site for Experimental Laboratory

In October, 1916, the committee took under consideration the question of the selection of a suitable site for the committee's proposed experimental laboratory. In this study the committee acted in cooperation with a board of officers of the United States Army which had been appointed to inspect sites for the experiment station and proving ground of the War Department.

At the suggestion of the War Department requesting recommendation by the Advisory Committee in the matter, this committee inspected several proposed sites and after making inquiries as to the general health conditions and the problems of accessibility to Washington and the larger industrial centers of the East, protection from naval attack, climatic conditions, and cost of the site, it made recommendation to the War Department for the purchase of a site about 4 miles north of Hampton, Va., which had been appointed to inspect sites for the experiment station and proving ground of the War Department. This recommendation was accepted by the War Department and the site was purchased.

On this field the War Department has allotted to the committee a space suited to the erection of the committee's proposed research laboratories. The committee has designed the first building of the group contemplated, and the design has been approved by the architects for the War Department. Contract has been entered into for the erection of the laboratory at an estimated cost of $80,900. The laboratory building is now in the course of construction. At this laboratory the committee will carry on, in wide variety, research and investigation relating to aeronautic science and including a study of planes in free flight. The committee has also under preparation plans for the first aerodynamic laboratory to be installed at Langley Field, intended for the development of high wind speeds. The work of this laboratory will be begun as soon as plans are ready.

THE LONDON ENEMY AIRCRAFT EXHIBIT

The Halberstadt Two-Seater

By G. DOUGLAS WARDROP

THE little Halberstadt single-seater, two-strutter, which played its part on the Western front in the spring and summer of 1917, has been little seen during the last year, but recently there has appeared a two-seater Halberstadt, one of which is on view at the London Enemy Aircraft Exhibit.

The Halberstadt two-seater belongs to the C class, or general utility machines, variously employed for reconnaissance, artillery spotting, photography, etc. From a small plate on the machine the year of manufacture is 1917, but the exact date could not be ascertained. This will probably be found later on, when the wings have been stripped, to be stamped on the wing spars. The same plate bore the marking CLII, the exact meaning of which is not clear at the moment, but which evidently indicates some special employment of machines of the general C class. The general arrangement of the Halberstadt is not greatly different from other makes of German machines of the same class, although in minor details some unusual features were noticed.

The body resembles in shape that of the smaller single seater, being of rectangular cross section, surmounted by a curved top, and terminating at the stern in a horizontal knife's edge. Constructionally, however, the two-seater is different, inasmuch as it is covered with three-ply, whereas the single-seater body was of the girder type and covered with fabric.

The internal framework of the body appeared to be of the form usually employed with this construction. In the nose the body terminates in a "spinner" and on the whole the body appears to have a fairly good stream-line form. The engine fitted is a 160 h.p. Mercedes.

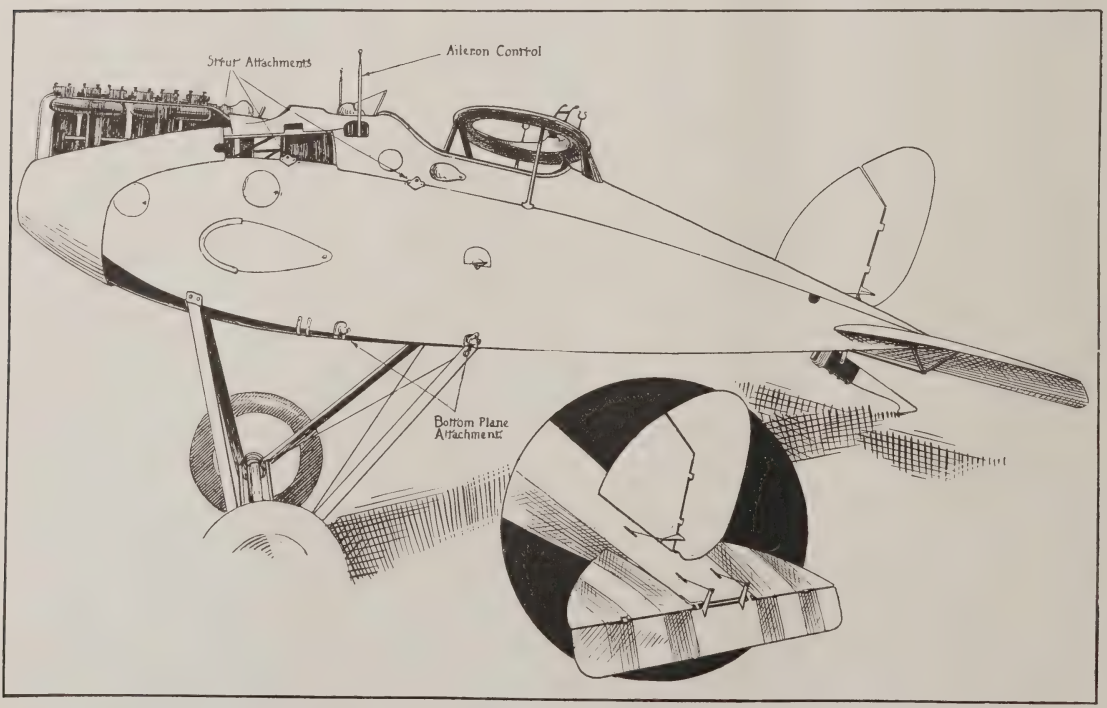
The seating accommodation is somewhat unusual in that both gunner and pilot are housed in a common cockpit, separated only by a deep transverse beam forming the back rest for the pilot. The armament consists of two machine guns, one fixed on the starboard side of the engine and operated by the pilot in the usual manner via an interrupter gear. The gunner's machine gun is mounted on a gun ring, of somewhat unusual appearance, mounted a considerable distance above the top of the body on a structure of tubes. A wireless set appears to have been fitted, judging from certain brackets in the gunner's cockpit.

The main planes, which were not in place on the machine examined, and which have not, therefore, been included in our drawing of the machine, apeared to be of equal span, but the chord of the lower plane is considerably smaller than that of the top plane. The mounting of the upper plane is somewhat unusual. From the body two struts slope outwards at a considerable angle, to the top plane. The two struts on each side connect the body and the rear top spar, coming to apoint on the spar, and apparently being vertical in front view. The aileron control is of the type originated by the Nieuport firm, i. e., the leading edge of the ailerons is formed by a steel tube, which extends through the wing into the center section of the top plane, where crank levers are fitted, connected up to the controls by vertical tubes. The latter are indicated in the drawing. The bottom planes are attached to the sides of the body.

The tail plane of the Halberstadt is of symmetrical cross-section, and is built up in two halves, attached on each side of the body. As the balanced rudder is wholly on top of the body, the elevator is in one piece, as shown in the sketch. There is no external bracing of the tail plane.

The undercarriage is of the usual Vee type, with stream-line steel tube struts. The apices of the two Vees are connected by two cross tubes, but no attempt has been make at stream-lining, the axle and the two cross tubes being left fully exposed to the air.

Huge Enemy Planes Seat 8 Men, Carry Bombs 13 Feet Long



With the British Army in France.—On September 12 German aeroplanes bombed the St. Quentin sector, and the enemy utilized a number of new type planes of huge size. Three of these were shot down east of Peronne. They were capable of seating eight men.

The most astounding thing about them, however, was that they carried bombs thirteen feet long, which contained 2,000 pounds of explosives. This is by far the biggest bomb the Germans have yet produced.

Big Martin Plane on Trial Flight

Another trial flight of the New Glen L. Martin passenger aeroplane was made Sept. 13th at Wilbur Wright Field.

While the Government censor does not permit the printing of a technical description of this aeroplane, it is permissible to state that the ship will easily carry from seven to ten passengers, although the seating capacity is built to accommodate four passengers.

Outline of the body of the Halberstadt two-seater biplane, 160 h. p. Mercedes engine. The inset is a sketch of the tail planes.

NAVAL and MILITARY AERONAUTICS

Key to Abbreviations

AAD—Assigned to active duty.
ADO—Report to Aviation Supply Depot, Dayton, Ohio.
ADT—Report to Aviation Supply Depot, Dallas, Texas.
AFO—Report to Aviation Supply Depot, Fairfield, O.
AGC—Report to Aviation Supply Depot, Garden City, L. I., N. Y.
AHT—Report to Aerial Gunnery School, Houston, Texas.
AIR—Transferred to the Air Service, National Army, without change in rank or date of commission.
ALF—Report to Camp Alfred Vail, Little Silver, N. J.
AMV—Report to Aviation General Supply Depot, Morrison, Va.
AOV—Report to School for Aerial Observers, Hampton, Va.
APR—Report to School of Aerial Photography, Rochester, N. Y.
ARV—Report to Aviation Supply Depot, Richmond, Va.
ASM—Report to Aviation Mechanics' Training School, St. Paul, Minn.
BFT—Report to Barron Field, Fort Worth, Texas.
BRN—Report to Bakers Field, Rochester, N. Y.
BST—Report to Brooks Field, San Antonio, Tex.
CAF—Report to Carlstrom Field, Arcadia, Fla.
CAP—Commissioned as Captain, Aviation Section, Signal Corps.
CDT—Report to Aviation Concentration Camp, Dallas, Texas.
CFT—Report to Carruthers Field, Fort Worth, Texas.
CGC—Report to Aviation Concentration Camp, Garden City, L. I., N. Y.
CGS—Report to Aviation Concentration Camp, Greenville, S. C.
CIT—Report to Radio School, Carnegie Institute of Technology, Pittsburgh, Pa.
CJS—Report to Camp Jackson, Columbia, S. C.
CJW—Report to Camp John Wise, San Antonio, Texas.
CLR—Commissioned as Colonel, Aviation Section, Signal Reserve Corps.
CMV—Report to Aviation Concentration Camp, Morrison, Va.
CPA—Commissioned as Captain Air Service, National Army.
CPR—Commissioned as Captain, Aviation Section, Signal Reserve Corps.
CRI—Report to Chanute Field, Rantoul, Ill.
CSO—Report to the Chief Signal Officer, Washington, D. C.
CUI—Report to School of Military Aeronautics, Cornell University, Ithaca, N. Y.
CWT—Report to Call Field, Wichita Falls, Texas
DAF—Report to Dorr Field, Arcadia, Fla.
DAP—Report to Director of Aircraft Production, Washington, D. C.
DIK—Report to Camp Dick, Dallas, Tex.
DIS—Honorably discharged from service.
DMA—Report to Director of MilitaryAeronautics, Washington, D. C.
ELA—Report to Eberts Field, Loanoke, Ark.
EOT—Report to Ellington Field, Olcott, Texas.
FLA—Commissioned as First Lieutenant Air Service, National Army.
FLR—Commissioned as First Lieutenant, Aviation Section, Signal Reserve Corps.
FLT—Commissioned as First Lieutenant, Aviation Section, Signal Corps.
FOB—Report to Fort Omaha Balloon School, Omaha, Neb.
FRF—On duty requiring regular and frequent aerial flights.
FSO—Report to Fort Sill School for Aerial Observers, Fort Sill, Okla.
GIT—Report to School of Military Aeronautics, Georgia Institute of Technology, Augusta, Ga.
GLC—Report to Gerstner Field, Lake Charles, La.
HHN—Report to Hazelhurst Field, Mineola, L. I., N. Y.
JMA—Rated as Junior Military Aviator.
JRC—Report to Jackson Field, Riverside, Cal.
KST—Report to Kelly Field, So. San Antonio, Tex. (When specified in the order, the number of the field is given in parentheses)
LDT—Report to Love Field, Dallas, Tex.
LHV—Report to Langley Field, Hampton, Va.
MAC—Report to March Field, Allesandro, Cal.
MAJ—Commissioned as Major, Aviation Section, Signal Corps.
MAT—Report to Mather Field, Sacramento, Cal.
MDO—Report to McCook Field, Dayton, Ohio.
MIT—Report to School of Military Aeronautics, Massachusetts Institute of Technology, Boston, Mass.
MJA—Commissioned as Major Air Service, National Army.
MJR—Commissioned as Major, Aviation Section, Signal Reserve Corps.
MSC—Report to Radio School, Maryland State Agricultural College, College Park, Md.
OBS—Attached to the Aeronautical Service as Observers.
OSU—Report to School of Military Aeronautics, Ohio State University, Columbus, Ohio.
PFO—Report to Post Field, Fort Sill, Okla.
PMT—Report to Park Field, Millington, Tenn.
PUP—Report to School of Military Aeronautics, Princeton University, Princeton, N. J.
PWM—Report to Payne Field, West Point, Miss.
REL—Relieved from present duty.
RSD—Report to Rockwell Field, San Diego, Cal.
RTR—Retransferred to organization attached to previous assignment to aviation duty.
RWT—Report to Rich Field, Waco, Tex.
SBI—Report to Scott Field, Belleville, Ill.
SAG—Report to Souther Field, Americus, Ga.
SGS—Report to Camp Sevier, Greenville, S. C.
SLA—Commissioned as Second Lieutenant Air Service, National Army.
SLR—Commissioned as Second Lieutenant, Aviation Section, Signal Reserve Corps.
SLT—Commissioned as Second Lieutenant, Aviation Section, Signal Corps.
SMM—Report to Selfridge Field, Mount Clemens, Mich.
SRC—Report to Columbia School for Radio Officers, New York City.
TFT—Report to Taliaferro Field, Fort Worth, Texas. (When specified in the order, the number of the field is given in parentheses)
TMA—Report to Taylor Field, Montgomery, Ala.
UCB—Report to School of Military Aeronautics, University of California, Berkeley, Cal.
UIU—Report to School of Military Aeronautics, University of Illinois, Urbana, Ill.
UTA—Report to School of Military Aeronautics, University of Texas, Austin, Tex.
VBW—Report to Vancouver Barracks, Washington.
WAC—Report to Aviation Concentration Camp, Waco, Tex.
WCS—Wire to the Chief Signal Officer upon arrival.
WDM—Wire, Director of Military Aeronautics, upon arrival.
WFO—Report to Wilbur Wright Field, Fairfield, Ohio.

FOREIGN NEWS

GREAT BRITAIN

On the night of Aug. 21-22 the weather conditions were exceptionally good, and a large amount of work was carried out by our squadron.

Military objectives at Frankfort and Cologne were heavily attacked. Very good results were observed, and bombs were sent all around the stations and barracks.

A railway junction of Treves was also successfully attacked. All our machines returned safely.

Four hostile aerodromes were heavily bombed and many hangars hit. Machine guns were freely used on aerodromes, trains, and searchlights as well as anti-aerial batteries. One of our machines is missing.

On the morning of Aug. 22 one of our squadrons attacked the chemical factories at Mannheim. During the heavy fighting on the outward journey two of our machines were brought down. The remainder reached and successfully bombed their objective. Very fierce fighting again took place on the return journey, as a result of which five more of our machines are missing. Three hostile aeroplanes were destroyed. Two of these seemed to crash, and one went down in flames.

Two other squadrons attacked the railway sidings at Coblenz at about 7:30 o'clock on the morning of Aug. 22, and a hostile aerodrome at Hagenau was bombed with very good results. All these machines returned safely.

During the night 194 tons of bombs were dropped, and 215 tons of projectiles were dropped during the day.

The feature of recent air work has been the bombing of enemy aerodromes by overwhelming forces of our aircraft. Two of these raids, on August 16-17, give an idea of their effectiveness.

A large number of our machines started about noon for the Habourdin aerodrome. Arriving there about 1 o'clock, they attacked from an average height of about 200 feet and at this elevation in daylight made good hits with their bombs. No enemy aeroplanes tried to interfere, but two were seen and attacked; one shot down crashed into some trees close to the aerodrome; the other was driven down and presumably crashed, although it was not observed actually to hit the ground.

The machine guns and anti-aircraft guns, which were plentiful about the aerodrome, were attacked from above by machine guns on our aeroplanes as soon as they opened fire or disclosed their positions. All were silenced; none did any harm. Hundreds of bombs were dropped. Three large iron hangars containing numbers of enemy machines were destroyed; six others were known to have been hit and partly wrecked. Two machines on the ground outside of the sheds were hit by bombs and burned.

Fires were caused in the officers' and men's quarters and a building supposed to be the officers' mess was blown up and destroyed. A number of other outbuildings, including one ammunition shed, were set afire and a large number of casualties were caused among the mechanics and other personnel, who when the raid began ran toward a hospital in the neighborhood for shelter.

After half an hour spent in destroying the aerodrome, other objects were sought. A train on the railway was shot at, chased and finally stopped. One staff motor car was shot at on the road and overturned into a ditch; another was made to run up a steep bank, where it stuck; no occupant was left in either, presumably all were killed. Finally several transports were shot at on the road and men and horses were seen to fall. All our machines returned home safely.

The raid on the following day started earlier, the machines going out at 7 o'clock. The objective this time was the Lomme aerodrome, where the sheds were of wood or canvas. More than 100 bombs were dropped, some from heights as low as fifty feet, which was too low because the concussion strained our own machines. Four sheds were set afire and it is believed three others were destroyed. A number of outbuildings were wrecked and the personnel running in all directions, were chased and killed or driven to shelter.

Large workshops near by were hit by several bombs and left smouldering. Two enemy aeroplanes which were met dived to the ground and crashed on the aerodrome in mere terror, without being shot at. Afterward our men attacked troops and transports. One of our machines was shot down by the anti-aircraft defences; all the others returned undamaged.

It is believed that in each case the result of the raid was the practical obliteration of the aerodrome and the destruction probably of all the machines in them and of a large part of the personnel.

The official statement on aerial operations issued Sept. 6th says:

Much reconnaissance and photographic work was accomplished by the air force on Sept. 4 and a large number of artillery and contact patrols were carried out. The weight of bombs dropped by us during the day was twenty-three tons. No bombing was possible after dark.

Enemy machines, working in large formations on the German side of the lines, showed considerable activity. Twenty-five hostile machines were brought down by our airmen and no less than nine ballloons were shot down in flames. In addition fourteen hostile machines were driven down out of control. Sixteen of our machines are missing.

One of our machines reported as missing in the fighting of Sept. 2 has since returned.

In the course of the weeks which have elapsed since the commencement of our offensive on Aug. 8, 465 enemy machines have been brought down by our airmen, their destruction being in every case clearly established. In addition, the total of enemy machines proved to have been driven down out of control, many of which must actually have crashed, is exactly 200.

The above figures are exclusive of the considerable number of enemy machines brought down by gunfire from the ground. Sixty-one German balloons have been set on fire. Nine hundred and eleven and one-half tons of bombs have been dropped by us.

Practically the whole of the air fighting has taken place on the enemy's side of the line. The number of our machines which have failed to return during this period is 262.

The storm centre of British aerial activity throughout the week has been the sector from Lens to Peronne, the airmen materially assisting in piercing the immensely strong Hindenburg defences and harassing the retreating enemy. German organizations behind the Wotan line, including the vital railways radiating from Valenciennes, were heavily bombed. In the course of the week 166 tons of explosives were dropped in the battle area. Ninety-two enemy machines were destroyed and forty-five disabled, while seventy-five British machines were reported as missing.

Eleven German aeroplanes were brought down on Sept. 6, in air fighting, and twelve were driven down out of control. One enemy balloon was destroyed. Five of our machines are missing.

Observation for the artillery was continued both by aeroplane and balloons. Some valuable reconnoisances were carried out by our machines, and a large number of photographs were taken, while our balloons reported much useful tactical information.

During the day and the following night thirty-two tons of bombs were dropped by our airmen, the railway connections at Armentières, Lille, Douri, Denain, Cambrai, and St. Quentin being heavily attacked. All our night-flying machines have returned.

On the night of Sept. 6-7 our squadrons carried out attacks against two hostile aerodromes. Fires were caused, but observation of the results was hindered by weather conditions, as were operations generally. All of our machines returned.

On the morning of Sept. 7 our squadrons attacked the railways at Ehrang, (four miles northeast of Treves, Prussia,) and the chemical works at Mannheim Good bursts were observed on and beside the railway lines at Ehrang.

Fierce opposition was met with in the raid on Mannheim, but, despite this, the objective was reached and successfully bombed. Eight direct hits and many other good bursts were observed on the chemical works. Our squadrons fought largely superior numbers of enemy aeroplanes both before and after reaching the objective.

One squadron had a hard, continuous fight for a distance of seventy miles before reaching its objective, and the fight continued for another seventy miles on the way back. Over two tons of bombs were dropped on Mannheim.

As a result of the fighting one enemy aeroplane was destroyed and two more were driven down out of control. Four of our machines are missing.

Clouds and rainstorms limited work in the air on Sept. 7, but a good deal of artillery observation was carried out, as well as reconnoissances and contact patrols. Eight hostile machines and one balloon were destroyed by our airmen. Three of our machines are missing.

Thirteen tons of bombs were dropped by us during the twenty-four hours. Our night bombing machines all returned safely.

FRANCE

The French War Office, in reporting on operations in Macedonia, says that French, Serbian, and British aviators dropped two tons of bombs on enemy encampments.

Marshal Foch has made the following announcement on September 16:

"Fair weather enabled our aviators to do a great amount of work on our own front, as well as in connection with the American Army. There were many severe combats. Fourteen enemy aeroplanes were brought down or put out of action and seven captive balloons set on fire. Our airmen attacked the enemy with machine guns and bombs. On enemy concentrations seven tons of explosives were dropped.

"Our airmen continued their activity during the night and dropped more than twenty-three tons of explosives on the railroad stations at Laon, Hortier, Juniville, Conflans, Mars-la-Tour and other places. Our observation aeroplanes made numerous reconnaissances, regulated the artillery fire and took some photographs far behind the enemy lines."

The Allied pursuit groups played a large part in maintaining an aerial barrage over the sector of the advance and attacked enemy planes and balloons wherever found. The work of the observation corps was greatly facilitated thereby.

The pilots and observers of the Allied units fired more than 30,000 rounds from their machine guns at convoys on the roads, artillery and troop concentrations.

Several enemy squadrillas came in the direction of Paris during the night. Our lookout posts followed and reported their movements and they were subjected to a particularly intense barrage. Other methods of defense were also put into operation. Several bombs are reported to have been dropped, causing a certain number of victims and material damage. The alarm was given at 1:25 and the "all clear" at 3 o'clock.

One of the enemy planes was brought down by a shot from the artillery. The machine fell in one of the northern suburbs. In the wreckage were found the bodies of an officer and two men.

The French War Office has issued the following upon aviation activities:

"On September 16 eight enemy planes were brought down or damaged and one captive balloon was burned. Night bombing machines, notwithstanding the storm, dropped ten tons of projectiles on enemy stations, bivouacs and aviation grounds. Several fires broke out."

In aerial fighting on September 16, French aviators destroyed 12 German aeroplanes and set on fire 16 captive balloons. Sunday night bombing squadrons dropped forty-six tons of bombs on military targets behind the German lines from Laon to Metz.

GERMANY

The German official report for September 16 says:

"As a reprisal for the continued bombing of German towns, 22,000 kilograms of bombs were dropped on Paris last night.

"We shot down four enemy aeroplanes and fifteen captive balloons."

The official statement on aviation activities for September 17 says:

"Yesterday we shot down 44 enemy aeroplanes. Colonel Lorzer achieved his fortieth and Lieutenant Rumey his thirty-fifth victory. Lieutenant Thuy achieved his fiftieth aerial victory."

MODEL NEWS

Edited by John F. McMahon

Model Aeroplane Building as a Step to Aeronautical Engineering

Gasoline Engines

WE will now take up Gasolene Motors. This type of motor is of more difficult construction than the Compressed Air or Steam Engine. The principal of the engines are much the same, the only difference is, the gasolene engine works on internal combustion, by that I mean that the compressed air motors or the steam engines are driven by means of pressure forced into a tank for the former and generating steam in a boiler for the latter.

The Gasolene Engine does not need a boiler or a tank. The gas is sucked into the cylinder by the piston and then compressed by the action of the piston as it again ascends to its highest point where it is exploded by a spark. This explosion expands the highly explosive mixture and forces the piston down. Of course the reader will readily see that the constant explosions cause wear and tear on the cylinders, pistons, and bearings and the construction must be better and heavier than is needed in the other types.

The construction of a gasolene engine presents many difficulties and very few are known to be successful, the main reason for this being the saving of weight without sacrificing strength, so for this reason I do not think it advisable to start work on this type of motor. Of course if the reader happens to be a machinist, he can attempt to construct the motor from the data which follows.

It is not necessary to build a Gasolene motor to be a good Aeroplane pilot, but he must have a thorough knowledge of the workings of a Gasoline Engine.

The accompanying cut will show the working principle of two different types of gas engines.

Figures 1, 2, 3, and 4 show the four cycle type which means that in order to suck in the gas, compress it, explode, and last exhaust it, the engine must make four separate strokes.

Figures 5 and 6 are for the two cycle type which only needs two strokes to do the same as the four cycle.

Figure 7 shows the piston at its highest point and about to start down. This action will cause a suction of gas through the intake valve, which is automatic, being held in a closed position by the spring, only opening when the suction becomes strong enough to pull it out of place.

When the piston reaches its lowest point, the intake valve closes and the piston starts upward and compresses the gas because it has no possible channel in which to escape Figure 2.

In Figure 3, the gas being compressed the spark is timed to fire just as the piston reaches top centre, and the piston is forced down. This is the power stroke.

Figure 4, the piston is at its lowest point and starts upward, forcing the burnt gas out through the exhaust valve which is opened by the cam, rotated by the gear arrangement at half speed.

The piston travels to its highest point again and is now in position to suck in raw gas. These are the four strokes of a four cycle engine.

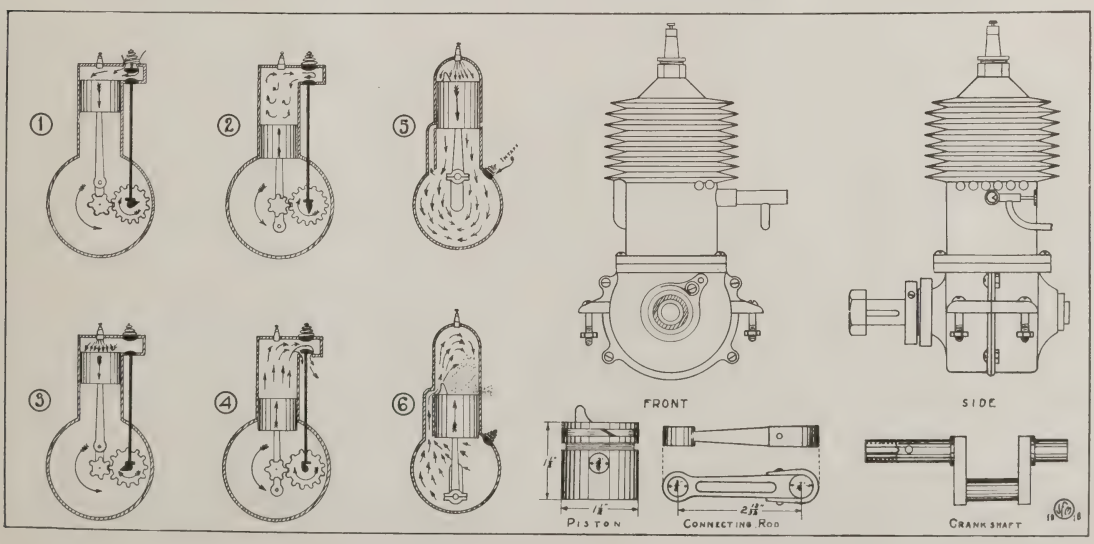
The Figure 5 shows the first stroke of the two cycle engine, or explosion stroke. The explosion drives the piston down which compresses the gas in the crankcase. When the piston reaches the bottom the compressed raw gas is released and shoots up through a channel uncovered by the piston and into the chamber at the top. To keep the gas from shooting directly across and out through the exhaust parts a baffle plate is attached to the piston. This baffle plate causes the gas to shoot upward and to force the burnt gas out at the same time.

The piston now starts back and compresses the new gas, at the same time forming a vacuum in the crank case which sucks in raw gas which will be compressed and forced into the top chamber when the piston reaches the bottom centre. See Figure 6.

A close study of these figures will show the reader without any explanations, the working of a two cycle engine.

Another point to be remembered is the elimination of valves in this type of engine. This saves considerable weight and makes it adaptable to model aeroplane practice, and but for its cranky ways would be an ideal piece of mechanism. A one cylinder two cycle engine of a certain size is almost as powerful as a *two* cylinder engine of the four cycle type as it gets a power stroke for each revolution while the four cycle engine gets a power stroke for every other revolution.

To the right of the cut are two views of a small motor of the two cycle type to give the reader an idea of the proportions. The cylinder and crankcase are of aluminum castings machined later. The piston is made of cast iron with two rings and is almost a shell. The connecting rod is made of thin steel casting, the wrist pin bearing is just a ½" hole while the big end is two piece and babbited with white metal.



The bearings of the crankshaft are fitted with bronze bushings. The crankshaft is turned from a solid piece of steel and fits tightly into the bearings so as not to leak compression.

The carburetor is in name only it would be better to call it a mixing valve, it is clearly shown in the drawing. The stroke and bore of this engine are 1½".

This motor weighs 19 ounces and gives ½ h.p. at 2000 R.P.M.

So much for motors we will now start on our man carrying glider.

(To be continued)

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

The Colonel Meets Some New Uniforms

They wore new serge uniforms, leather puttees, and Stetsons just out of the box which showed the recently purchased silver and black hat cord off to a great advantage. The trio stood near the Post Office waiting for a bus to go to town. They appeared well satisfied with themselves and the world in general and when the commandant of the field rounded the corner in his car not one of the three appeared to notice him. In fact, they ignored him. Nary a ripple from them did the Colonel get. The car stopped.

"Come here," said the Colonel to the trio, at the same time motioning to an interested M. P. to be ready for action.

"Don't you know enough to salute superior officers?" asked the Colonel severely.

"Well, I'll tell you old man," answered one of them taking a cigarette from his mouth and blowing the smoke smoothly over the ash, "we've talked among ourselves about it and Washington has given no word to satisfy us. Some say we should, others say we shouldn't, so there you are. I suppose it's alright for you but we're not so sure." "Say," he broke off suddenly, "that dog's face is queerly marked. Ever try using mange soap for those flees?"

The Colonel gasped. "How long have you three been on this field," he thundered. The M. P. trembled and prepared to do his duty. The P. O. C. puffed on a cigarette and said calmly:

"About three months. And let me tell you, old scout, it's hotter than hell in that post office since they made us wear uniforms."

"Drive on!" said the Colonel to his chauffeur.

"Wonder who that guy was," one of the P. O. C. said. "He sure acted as though he thought he knew us."

(A Hot-Aircraft Poem)

Awake! for Morning in the Bowl of Night
Has flung the Stone that put the Zepps to flight.
The Men who sought the Raiders have returned.
They very nearly found them—but not quite.

And as the Cock crew, those beside the Shed
Welcomed them Home, believing them all dead;
Put the Machines away, and talked a while,
Brought forth the Wine—and then went back to Bed.

And strange, among the Anti-Aircraft Lot
Some could articulate, while Others not;
And suddenly One more impatient cried:
"Who is the Potter, pray, who failed to Pot?"

Then somewhat peevishly there answered One,
In private Life a local Butcher's Son,
"To-night it was my Turn to Biff the Zepp—
But I forgot to load the Beastly Gun."

Thinking this deeply o'er, as best I may,
I turn aside, and Someone comes my Way—
An Expert, knowing All there is to know,
And to himself I hear him softly say:

"Indeed, the Slide-Rules I have loved so long
Have done my Credit in Men's Eyes much Wrong,
Have set The Aeroplane upon my track,
And sold my Reputation for a Song."

Myself when young did eagerly frequent
Whitehall and Thereabouts, and Months I spent
Hoping to gain one Stripe at least; alas!
I left by the same Door as in I went.

How sweet is learning how to fly, think Some;
Others—how blest the D.S.O.'s to come!
Ah, take the Cash in Hand, and damn the Rest—
Test new Machines, and you will make Things hum.

To wander round the Haunts of Flying Men
Gives Inspiration to the Poet's Pen.
On every Hand one hears, with grateful Joy,
A Touch of true Refinement now and then.

For in an Aerodrome, one dusk of Day,
I watched a School-'bus sticking in the Clay,
And one Mechanic to the Other said:
"Go gently with it, Brother—gently, pray!"

Then said an Engine, with a long-drawn Sigh:
"My Bearings with Neglect have long gone dry,
But, fill me with the old familiar Juice—
Methinks I might recover by-and-by!"

The Scout no Question makes of Ayes or Noes,
But right or left, as banks the Pilot, goes,
And he who dropped One down into the Field—
He knows about it all—he knows, he knows!

Here with a Dud Machine, if Winds allow,
A Flask of Wine, a Load of Bombs—and Thou
Before me sitting in the Second Seat—
A Midnight Raid is Paradise enow.

And when I turn upon the Homeward Trail,
Dreaming of Decorations, Cakes, and Ale,
How bitter on the First Day's Leave to find
My Name spelt wrongly in the "Daily Mail"!

TRANS-OCEANIC FLOAT SYSTEM

Alfred W. Lawson, Vice-President and General Manager of the LAWSON AIRCRAFT CORPORATION, who has spent the last eleven years helping to develop the aircraft industry in the United States, is the inventor of a system of transporting airplanes across oceans by their own power.

According to this system any airplane that is capable of flying and carrying more than one hour's fuel and oil can be flown across the Atlantic or any other ocean.

Any aviator who has graduated from one of the United States training schools will be qualified to pilot an airplane across the ocean, according to Mr. Lawson's system, the chief requirement being that he knows how to make a good landing.

It will be easier for a pilot to fly across the Atlantic Ocean by this system than for one to make a cross country flight of the same number of miles for the simple reason that by this system the landing place is always within sight and within gliding distance.

Briefly an outline of the plan is as follows:

Approximately 25 miles apart between the coast of America and the coast of France will be placed floats upon which the pilot can land and depart from whenever he wants to descend for fuel or repairs.

These floats are to be approximately 500 feet long and 100 feet wide, but can be increased in length and width if preferred.

These floats are built in the shape of regular steamship hulls and are kept in their position of latitude and longitude by their own power.

These floats are protected from submarines by carrying longer range guns than the submarines carry and also by a system of nets which protect them against torpedoes. They are also further protected by the airplanes which carry a supply of bombs for that purpose.

In the holds of these floats are carried the supplies of fuel and spare parts for airplanes, as well as a repair shop, and sleeping apartments, and dining rooms, etc., for the pilots and crew.

The float will contain a slowing up process whereby the speediest machines can be stopped within 300 feet and slow machines within 100 feet.

There will be elevators arranged at both the bow and the stern of the float whereby airplanes can be let down into the hold and receive their fuel and repairs out of the way of other machines while landing.

The float is always headed into the wind so that the pilot always lands into the wind from the stern, while he is let down into the hold at the bow and then moved back in the hold to the stern again where he is elevated to the deck, from whence he starts off on his journey again into the wind. By this method, airplanes can be landed and sent off again at the rate of one every five minutes.

On condition that each machine stopped at every 4th float more than 1,000 airplanes can be transported from America to France every day that the weather is suitable.

It is estimated that there are more than 150 suitable flying days over the Atlantic Ocean during the course of a year, so that by this system it is possible to send to France more than 150,000 airplanes of every description in a year.

By this system, airplanes can be sent across the Atlantic Ocean within 24 hours, or they can be sent from factories in the interior of the United States to the battlefronts in the interior of France within 48 hours, thus saving all of the material and labor necessitated in crating the machines at the factory and uncrating them and setting them up at the battlefields.

At the present time by steamship methods it requires more than 30 days to deliver airplanes from the factory to the battlefront, and therefore more than 90% in time will be saved by this system in delivery of machines.

This system will also save the transportation cost of the pilots, who will also receive some much needed practice in flying en route. If 100,000 airplanes were transported across the Atlantic by this system that would mean a saving in shipping facilities for 200,000 more troops alone. It would also save enormous shipping facilities for other war materials that would take the place of the space occupied by the extremely bulky airplanes.

Besides the time and shipping facilities saved on the transportation of 100,000 airplanes an approximate saving in the cost of transportation will total more than $100,000,000.

This system can be put into operation within 4 months after it has been begun, and Mr. Lawson is ready to give an actual demonstration of its practicability immediately if called upon to do so.

Many letters have been received from the leading aircraft engineers and manufacturers of the United States in which they say, that they have examined Mr. Lawson's system and find it practical in every way.

The engineering force of the LAWSON AIRCRAFT CORPORATION are unanimous in their praise of the system, and the LAWSON AIRCRAFT CORPORATION herewith publicly advocate and recommend that the United States Government give it a trial and if found practical to utilize it at the earliest possible moment as one of the short cuts to the heart of the Kaiser.

AN OVERHEAD PHOTOGRAPH SHOWING THE POSITION OF THE BLOCK SHIPS SUNK AT THE ENTRANCE OF ZEEBRUGGE HARBOR

This official photograph was taken from an aeroplane flying over Zeebrugge, and clearly proves how effective the fairway into the port was obstructed by the block ships sunk there. The "Iphigenia" and the "Intrepid," their funnels showing above water, can be seen lying in the entrance to the Bruges Canal, while the "Thetis" was sunk outside the mouth of the canal in the main channel of the harbor. Some small enemy craft are also visible

The World of Worthy Appeal

(*Written Exclusively for Aerial Age Weekly*)

During the Fourth Liberty Loan Drive, which begins on September 28 and ends on October 19, think and talk nothing else. Nobody knows where a word may sell a bond, so talk, talk, talk! Buy all you can yourself; then sell all you are able to sell by a word of mouth appeal to anybody who will listen to you.

Remember how much the Kaiser accomplished by just *talk*. He and his henchmen knew better than any other persons in the world the value of the talk of the fellow in the street to the other man, nor did they under-estimate the importance of the petty conversations between housewives over the back fences.

They sent their ideas trickling by word of mouth from the poisoned source in the place of the All Highest, down through half the valleys of the world, a stream that gathered force and volume as it sped, until it flowed out into an ocean of blood.

They called it propaganda; literally, it is plain gossip, sent abroad to work its will in the plastic minds of the Germans at home and to convince all else who might heed. In New York, San Francisco, London and Paris and Hong Kong, the vile stream flowed, overlapping its banks and fertilizing new field for German kultur.

Some of that stream of talk we have been able to dam by building up dykes made of the bodies of men, dykes that now run over half the world.

You can help to tend these dykes by fighting talk with talk. Talk Allied Ideals, Americanism, all the time, but for the twenty-two days of the Fourth Liberty Loan Drive, talk Bonds, and Bonds.

Even if your propaganda only persuades one person to buy one bond, you will be directly loading a gun for a soldier.

Naval Aviation Schools

Washington, D. C.—The Navy Department authorizes the following:

The first aviation unit organized in America and sent abroad using American-made material, was the First Marine Aeronautic Company, equipped for water flying only, which is now stationed abroad at a Naval Base. This information is given in an announcement of the progress of Marine Corps aviation which has just been made public at Marine Corps Headquarters.

In addition to the flying field maintained at Miami, Florida, where all training in actual flying is given, the Aviation section of the Marine Corps gives candidates instruction in ground work at the Massachusetts Institute of Technology, Boston, Mass., and has two schools for instruction in aviation mechanics.

The course in actual flying at the Marine Flying Field, Miami, which covers a period of 75 days, includes preliminary, acrobatic and formation flying. All students receive instruction in bombing, gunnery and reconnoissance work. The reconnoissance work, the most hazardous feature of aviation, includes following up bombing squadrons for making photographic records. In obtaining these photographic records, the aerial photographers must make their way to the scene of activity and not only record the result of the bombing but evade the prepared enemy fire as well.

At the Massachusetts Institute of Technology, where all ground work instruction is given, there are now 289 students. One hundred and thirty-two men are in classes and 157 are awaiting assignment. When marines are assigned to this school they are enrolled as Gunnery Sergeants for the duration of the course and receive the pay allotted to this rank. Those who show themselves to be promising material are made officers after completing their training as fliers. The ground course lasts about 10 weeks and 80 men are graduated each month. No break is allowed in the supply of men to the school, by keeping 100 men in reserve to be passed upon by Aviation officers. If a man fails to be graduated he has the option of being transferred to training for regular duty in the Marine Corps, or being discharged.

Of the two schools for mechanics, the larger is maintained at the Naval School for Mechanics, Marine Corps Section, Great Lakes Training Station, Chicago, Ill. Here marines are trained as mechanics, riggers and armorers. At present there are 120 enlisted men taking the course at Great Lakes, and 60 men are sent each month from the Marine Corps. The total number of men allotted to the Marine Corps at one time is 360.

The second school for aviation mechanics is located at the Naval School, Marine Corps Section, San Diego, California. The training is the same as given at the Great Lakes School. Ninety-three enlisted marines are taking the course at the present time. The capacity is 120.

At present the Marine Corps Aviation Forces in France, equipped for land flying only, are performing pursuit, combat, bombing and reconnoisance duty. In addition, they are performing duties which involve actual flying with heavier and lighter-than-air craft, the former consisting of pursuit, combat and gunnery machines, seaplanes and flying boats. Kite balloons are used in performing the duties connected with lighter-than-air craft.

An Aviation Section is maintained at Headquarters, U. S. Marine Corps. All selections for the personnel of the Marine Reserve Flying Corps are made by this office. It also makes all requests for material for the use of the Aviation Section, obtained from the army and navy. It is estimated that in addition to the personnel at present attached to Aviation, it will need 1,500 officers and 6,000 enlisted men to carry on the work assigned to the Aviation Section of the Marine Corps during the next year.

The Aviation Section of the Marine Corps will be called upon to furnish replacements for duties abroad. Since the recent arrival of Marine Aviation Forces in France, the operations have been very successful. One officer has been recommended for the Distinguished Service Cross and Medal of Honor for bringing down enemy planes.

The standard of the Marine Reserve Flying Corps is very high. No men are accepted for entrance into its Ground School with the prospect of becoming officers unless they are as nearly physically perfect as possible. Applicants must weigh not less than 135 pounds and not over 165 pounds. The enlisted personnel has been selected from the very best in the Marine Corps. They are highly trained and given every opportunity for promotion to a commission.

Swimmer Saves Air Pilot

Babylon, L. I.—Quick action on the part of Dr. Harold E. Hewletts saved the life of a cadet who had fallen four hundred feet this afternoon with his hydroplane alongside Wagstaff Creek.

Dr. Hewletts was in swimming near the Babylon Club. He saw the plane about four hundred feet in the air and that the pilot seemed to have trouble in making a bank. Suddenly the machine buckled and fell to the bank alongside the creek, pinning the pilot beneath it.

Dr. Hewletts jumped into a rowboat and with others hurried to the young man, who was unconscious when finally extricated from the tangled mass. An automobile was pressed into service after Dr. Hewletts had partially revived the cadet and he was taken to the naval aero station at Bayshore.

It was impossible to learn the name of the pilot. At the station, however, it was said that he would recover. He was badly cut and bruised about the hip.

(*Continued from page 127*)

relation was given in the following form:

Let x = ratio of $\frac{\text{engine weight less fuel}}{\text{aeroplane weight less engine}}$

If, then, the engine weight is increased y times in order to obtain a thermal efficiency a times the first, a must be greater than $\frac{x+y}{x+1}$, if the maximum range of flight of the machine is to be increased. Thus, if $x = 4$, which is a fairly normal value, and $y = 1.5$ (*i.e.*, engine weight increased by 50%), the new efficiency required to give increased range of flight must be greater than $\frac{5.5}{5} = 1.1$ times the first, or the efficiency must be increased by more than 10%. From this, therefore, it is apparent that the choice of types A and B will depend entirely upon the purpose to be achieved, *i.e.*, upon the range of flight.

Referring to figs. 10 and 11 again another fact is apparent. The heavily loaded machine is best suited by an engine possessing a large excess of power which can be used readily for climbing purposes, or, if the wing area were variable, for increase of speed at will. Since in such a machine the question of minimum weight is not so pressing as in the lightly loaded machine, it would seem that an engine working as closely as possible to type B, and hence possessing a high efficiency, could be designed more readily for a heavily loaded machine to perform a flight of lengthy range than for a lightly loaded machine in which the question of getting a light enough, and at the same time efficient, engine would present some difficulty. Type A, of course, possesses most of the advantages for flights of ordinary range.

One hesitates to suggest how the problem of the application of the dual combustion cycle to aero engines may be met, so many seem to be the difficulties with which an attempted application seems to be beset. These difficulties conquered, however, means quite a desirable improvement in the power weight factor of an engine, and it would thus appear worth while to devote some attention to the possibility of its successful attainment. The writer is sanguine enough to think that a satisfactory aero engine can be designed to burn the lighter oils at constant volume, with an additional combustion process at constant pressure using the heavier oils, or the lighter oils if desired. The problem might be met by the application of some system of direct injection by positive air pressure of constant velocity past the fuel jet such as proposed by Mr. A. W. Reeves.

The writer would here point out that the successful introduction of dual combustion working would afford an efficient method of governing by the pilot of an aeroplane. At its full power the engine would be working on type A, ρ having its maximum value. This will be when climbing. If control is exercised over the constant pressure combustion period only in order to reduce the power developed, as will be necessary for horizontal flight, there will be an increase of thermal efficiency. Thus, when flying horizontally at its normal speed through the air, an aeroplane would demand from an engine worked satisfactorily on this cycle a smaller fuel consumption per horse-power than when employed in climbing or flying at excessive speeds.

Complete Expansion and Compounding

The remainder of these notes may be taken now to apply to all internal combustion engines in general. They are partly the outcome of an interesting article on "The Case for Compound Engines," by Mr. J. L. Napier, which appeared in the April issue, 1916, of *The Automobile Engineer*.

In Mr. Napier's article a table is given, in which the increase of power obtained by compounding is given in relation to the amount of fuel burned. The Otto cycle is developed exclusively, *i.e.*, all the heat is developed at constant volume. The table is partly reproduced here, with the difference that a is now written for R and r for n. The table was subsequently modified to include possible losses, but for comparative purposes Table I is here sufficient:

TABLE I

a	r	Limit of Expansion Volumes	Maximum Additional Power Per Cent
2	4	6.728	15.4
3	4	9.116	25.0
4	4	11.316	31.8

If, now, fig. 4 is consulted, showing the variation of efficiency in both types A and B, it appears that increase of fuel burned increases the divergence between the efficiency values. It is obvious that if the same amount of fuel is consideerd to be burned in both types, then the difference in the efficiencies will represent the gain of type B over type A. For example, suppose $a = 3$ and $\rho = 2$, r being equal 5, then the efficiency of type A is 41.5%, while that of type B is 60%, *i.e.*, there is an economic gain of $\frac{18.5}{41.5} \times 100 = 44.6\%$ by carrying out the expansion as in type B. In fig. 12 this case is represented by the two sections of the diagram, the unshaded portion representing the power developed in the h.p. cylinder if compounding is adopted, while the shaded portion represents that developed in the l.p. cylinder.

It is interesting to notice that if the case of type B is examined where $a = 1$, the efficiency is independent of fuel burned, since it is equal to $1 - \frac{1}{r^{\gamma-1}}$, the well-known expression for the efficiency of the constant pressure cycle. It is only on the introduction of constant volume combustion in type B that the efficiency increases with an increase of ρ. Thus, if $r = 5$, $\gamma = 1.4$, and $a = 2$, the compression pressure is 145 lb. per sq. in. absolute, and the explosion pressure is 290 lb. per sq. in. absolute. The efficiency is 47.5%, no matter how much a may be increased. If, however, some fuel is burned at constant pressure and the expansion carried out by compounding in the manner of type B, the efficiency goes on increasing up to the limit $1 - \frac{1}{r^{\gamma-1}}$; where r, however, is not the *actual* compression ratio, but the *virtual* compression ratio, giving a final compression pressure of 290 lb. per sq. in. absolute. If $\gamma = 1.4$, this value of $r = 8.2$. It can be seen on reference to fig. 5 that this approach to the limiting efficiency occurs rapidly at the beginning of constant pressure combustion. In other words, it may be said that by means of constant pressure combustion the compression ratio of type B has been raised *virtually* as regards efficiency from 5 to 8, although *actually* it has been unchanged during the engine operation. The following table has been compiled on the lines of Table I, showing the percentage gain to be derived from complete expansion or compounding when dual combustion is adopted:

TABLE II

a	ρ	r	Limit of Expansion Volumes	Maximum Additional Power Per Cent
2	2	5	16.35	36.6
3	2	5	21.9	44.6
2	3	5	24.5	66.2
3	3	5	32.85	75.4

These gains are, of course, subject to diminution from various causes, some pointed out and allowed for by Mr. Napier himself in a revised table. As relative figures, however, they give

New Book On Practical Aeroplane Rigging

For Aviation Officers and Mechanics

Approved for use in U.S. Navy Aviation Mechanics Schools

Written by

JAMES T. KING, formerly mechanic with Canadian and American Curtiss Aeroplane Factory and Royal Flying Corps; now instructor Aviation Dept., Dunwoody Institute; and

NORVAL W. LESLIE, Flight Sub-Lieutenant, R.N., instructor Aviation Department, Dunwoody Institute.

This book is well illustrated and takes up types, parts, alignment, care and maintenance of machines in a practical way; also the theory of flight. Only new book of its kind on Rigging.

THE DUNWOODY INSTITUTE

818 SUPERIOR AVENUE, MINNEAPOLIS, MINNESOTA.

some idea of the possibilities of duel combustion. At the same time it must be borne in mind that the values of α and ρ depend upon the amount of fuel which can be burned, and hence upon the amount of air available for combustion in the cylinder. This fact evidently indicates that decided advantages would accrue from a combination of the two principles of dual combustion and supercharging.

(*Continued from page* 129)

Insurance for Aviators

In the early part of the year 1917 the committee took up the question of insurance for aviators, and after correspondence with various life and accident insurance companies in the United States, it suggested to Congress, the War, Treasury, and Navy Departments the advisability of undertaking at an early date the insurance of aviators or some form of financial cooperation with the insurance companies that would enable them to write insurance at rates possible to the insured.

Aeroplane Design—Aeroplane Materials—Steel for Aeroplane Construction

The committee has cooperated with the Aircraft Production Board in connection with a wide variety of problems relating to the design, specifications, and tests of aircraft. The committee has now in hand (November, 1917) a most important investigation on the use of steel for aeroplane construction and is supervising the development of a design for construction in steel, to be later subject to a program of tests intended to show the possibilities of such type of construction.

In connection with the subject of the materials for aeroplane construction, the committee has given its attention chiefly to the investigation of strut forms for aeroplanes, the strength of spruce spars, and the development of cotton aeroplane fabrics as a substitute for Irish linen.

In the field of power-plant design and construction for aircraft, the committee has cooperated with the Bureau of Standards in the design, construction, equipment, and operation of a large vacuum chamber engine testing laboratory which is intended to reproduce the conditions of aeronautic engines operating at high altitudes. This equipment has been installed with special reference to the development and improvement of the "Liberty" engine, and important investigations bearing on this problem are now being carried forward. The committee has also carried on a number of researches on the subject of radiator design and proportion, carburetor design and adjustment, ignition apparatus, and is continuing its study of the problem of an aeroplane engine muffler.

Tests on Liberty Engine

At the request of the War Department, the committee loaned one of the members of its technical staff for the supervision of tests on the first Liberty engines at Detroit, Pikes Peak, and elsewhere, to determine their mechanical and thermal efficiency and the power delivery of the engines at various altitudes.

Aeroplane Instruments

The committee has undertaken important investigations relating to the development of various instruments used in the navigation of aircraft and in testing aircraft in free flight. In particular, there has been developed an improved form of geographic position indicator which will be of special value in connection with certain free flight tests under consideration.

Aircraft Communications

Regarding the subject of aircraft communications, the committee has cooperated in the development of a generator for wireless sending from aeroplanes and intended to satisfy the requirements of the Army and Navy. Means for receiving wireless signals in an aeroplane have also been investigated, and it has been established that a very efficient receiving set employing the sound method is practicable; investigations are still being carried on regarding means for detecting hostile aeroplanes before they are visible or before they can be heard by the unaided ear.

Mapping from Aeroplanes

On March 8, 1917, the committee took under consideration the development of methods for mapping from aeroplanes which should be rapid, economical, and sufficiently accurate for aviation purposes. Allotments were made for developing a new type of aeroplane mapping camera and gratifying progress has been made in the development of such an instrument. Before regular navigation of the air can be undertaken, it will be necessary to supply maps and to establish and suitably mark aerial routes and suitable landing places for the aviator. In certain sections of the country and through the generous cooperation of patriotic citizens interested in this work, gratifying progress has been made in these directions, notably between Dayton, Ohio, and Rantoul, Ill.

Aeroplanes Transport Troops for First Time

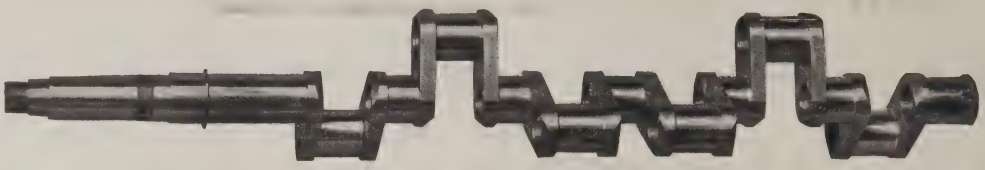
Washington.—Announcement was made on Sept. 21 at the War Department that for the first time soldiers under orders for duty have been transported in the United States by the air route.

On Saturday, Sept. 7, eighteen enlisted men were passengers in aeroplanes piloted by officers and the aeroplanes in formation of three, four and five ships carried the men from Chanute Field, Rantoul, to Champaign, Ill., where the men had been ordered to report at the United States School of Military Aeronautics, University of Illinois.

Navy Aeroplane Base at Galveston

Galveston.—As a result of a revision of the plans of the Navy Department for the construction of a naval air station here the total cost of the improvements will be more than three million dollars, or nearly double the original estimate. The proposed plant will consist of nine large hangars, repairshops, officers' and student aviators' quarters, barracks and medical quarters, for the accommodation of approximately 1,200 men. Of this number about 1,000 will be ground men and mechanics, 100 officers and 150 student aviators.

Each of the nine hangars will be 104 x 105, and will accommodate four machines. The first plans considered by the Navy Department called for six hangars and twenty-four sea-planes.



The site is 60 acres, between the railroad tracks leading out of the city and the bay. Three hundred and fifty thousand yards of dredging will be required for the work. Around the front and two sides of the 5-ft. elevation will be built a wooden bulkhead and an earthen levee around the back or south end. From 4,800 to 4,900 lineal feet of bulkheading, or filling material, will be required for filling in the dredged-in portion of the property. The basin will be dredged to a depth of 5 ft. the entire length of the building for a take-off, which will be 200 ft. in length. Construction will begin immediately.

Newspaper Started at Camp John Wise

The Balloon Pilot, the new weekly publication for Camp John Wise, has made its initial appearance. It is an eight-page paper. The aim of the management is to publish news of Camp John Wise and surrounding military fields, in the belief that the men will support a worthy paper.

Lieut. Harold R. Hall is editor, Lieut. H. S. Shultz, business manager, and Sergt. R. J. Kanawyer, advertising manager.

"NORMA" PRECISION BALL BEARINGS

(PATENTED)

Measure the value of a machine in terms of service—not in dollars and cents. What is its staying power? Is it continuously dependable? How long will its dependability last? Check up the first cost by the answers to these questions. Thus only can the right conception of values be had.

"NORMA" Precision Bearings, the standard bearings in high-grade ignition apparatus and lighting generators, are important factors in maintaining the service qualities of the airplanes, cars, trucks, tractors, and power boats on which these dependable equipments are used.

Be SURE. See that your electrical apparatus is "NORMA" equipped.

PRESIDENT WILSON SPEAKS FOR LIBERTY LOAN

President Addresses Huge Audience at Metropolitan Opera House

MY FELLOW CITIZENS—I am not here to promote the loan. That will be done—ably and enthusiastically done—by the hundreds of thousands of loyal and tireless men and women who have undertaken to present it to you and to our fellow citizens throughout the country; and I have not the least doubt of their complete success; for I know their spirit and the spirit of the country. My confidence is confirmed, too, by the thoughtful and experienced co-operation of the bankers here and everywhere, who are lending their invaluable aid and guidance. I have come, rather, to seek an opportunity to present to you some thoughts which I trust will serve to give you, in perhaps fuller measure than before, a vivid sense of the great issues involved, in order that you may appreciate and accept with added enthusiasm the grave significance of the duty of supporting the Government by your men and your means to the utmost point of sacrifice and self-denial. No man or woman who has really taken in what this war means can hesitate to give to the very limit of what they have, and it is my mission here to tonight to try to make it clear once more what the war really means. You will need no other stimulation or reminder of your duty.

War Itself Makes Aims Clear

At every turn of the war we gain a fresh consciousness of what we mean to accomplish by it. When our hope and expectation are most excited we think more definitely than before of the issues that hang upon it and of the purposes which must be realized by means of it. For it has positive and well defined purposes which we did not determine and which we cannot alter. No statesman or assembly created them; no statesman or assembly can alter them. They have arisen out of the very nature and circumstances of the war. The most that statesmen or assemblies can do is to carry them out or be false to them. They were perhaps not clear at the outset, but they are clear now. The war has lasted more than four years and the whole world has been drawn into it. The common will of mankind has been substituted for the particular purposes of individual states. Individual statesmen may have started the conflict, but neither they nor their opponents can stop it as they please. It has become a peoples' war, and peoples of all sorts and races, of every degree of power and variety of fortune, are involved in its sweeping processes of change and settlement. We came into it when its character had become fully defined and it was plain that no nation could stand apart or be indifferent to its outcome. Its challenge drove to the heart of everything we cared for and lived for. The voice of the war had become clear and gripped our hearts. Our brothers from many lands, as well as our own murdered dead under the sea, were calling to us, and we responded, fiercely and of course.

The air was clear about us. We saw things in their full, convincing proportions as they were, and we have seen them with steady eyes and unchanging comprehension ever since. We accepted the issues of the war as facts, not as any group of men either here or elsewhere had defined them, and we can accept no outcome which does not squarely meet and settle them. Those issues are these:

Shall the military power of any nation or group of nations be suffered to determine the fortunes of peoples over whom they have no right to rule except the right of force?

Shall strong nations be free to wrong weak nations and make them subject to their purpose and interest?

Shall peoples be ruled and dominated, even in their own internal affairs, by arbitrary and irresponsible force or by their own will and choice?

Shall there be a common standard of right and privilege for all peoples and nations or shall the strong do as they will and the weak suffer without redress?

Shall the assertion of right be haphazard and by casual alliance or shall there be a common concert to oblige the observance of common rights?

There Can Be No Peace by Bargain

No man, no group of men, chose these to be the issues of the struggle. They are the issues of it, and they must be settled—by no arrangement or compromise or adjustment of interests, but definitely and once for all and with a full and unequivocal acceptance of the principle that the interest of the weakest is as sacred as the interest of the strongest.

This is what we mean when we speak of a permanent peace, if we speak sincerely, intelligently and with a real knowledge and comprehension of the matter we deal with.

We are all agreed that there can be no peace obtained by any kind of bargain or compromise with the governments of the Central Empires, because we have dealt with them already and have seen them deal with other governments that were parties to this struggle, at Brest-Litovsk and Bucharest. They have convinced us that they are without honor and do not intend justice. They observe no covenants, accept no principle but force and their own interest. We cannot "come to terms" with them. They have made it impossible. The German people must by this time be fully aware that we cannot accept the word of those who forced this war upon us. We do not think the same thoughts or speak the same language of agreement.

It is of capital importance that we should also be explicitly agreed that no peace shall be obtained by any kind of compromise or abatement of the principles we have avowed as the principles for which we are fighting. There should exist no doubt about that. I am, therefore, going to take the liberty of speaking with the utmost frankness about the practical implications that are involved in it.

If it be in deed and in truth the common object of the governments associated against Germany and of the nations whom they govern, as I believe it to be, to achieve by the coming settlements a secure and lasting peace, it will be necessary that all who sit down at the peace table shall come ready and willing to pay the price, the only price, that will procure it, and ready and willing also to create in some virile fashion the only instrumentality by which it can be made certain that the agreements of the peace will be honored and fulfilled.

That price is impartial justice in every item of the settlement, no matter whose interest is crossed, and not only impartial justice but also the satisfaction of the several peoples whose fortunes are dealt with. That indispensable instrumentality is a league of nations formed under covenants that will be efficacious. Without such an instrumentality, by which the peace of the world can be guaranteed, peace will rest in part upon the word of outlaws and only upon that word. For Germany will have to redeem her character, not by what happens at the peace table but by what follows.

And, as I see it, the constitution of that league of nations and the clear definition of its objects must be a part, is in a sense the most essential part, of the peace settlement itself. It cannot be formed now. If formed now it would be merely a new alliance confined to the nations associated against a common enemy. It is not likely that it could be formed after the settlement. It is necessary to guarantee the peace, and the peace cannot be guaranteed as an afterthought. The reason, to speak in plain terms again, why it must be guaranteed is that there will be parties to the peace whose promises have proved untrustworthy, and means must be found in connection with the peace settlement itself to remove that source of insecurity. It would be folly to leave the guarantee to the subsequent voluntary action of the governments we have seen destroy Russia and deceive Rumania.

No Economic Boycott; All Treaties Public

But these general terms do not disclose the whole matter. Some details are needed to make them sound less like a thesis and more like a practical programme. These then are some of the particulars, and I state them with the greater confidence because I can state them authoritatively as representing this Government's interpretation of its own duty with regard to peace:

First, the impartial justice meted out must involve no discrimination between those to whom we wish to be just and those to whom we do not wish to be just. It must be a justice that plays no favorites and knows no standard but the equal rights of the several peoples concerned;

Second, no special or separate interest of any single nation or any group of nations can be made the basis of any part of the settlement which is not consistent with the common interest of all;

Third, there can be no leagues or alliances or special covenants and understandings within the general and common family of the league of nations;

Fourth, and more specifically, there can be no special, selfish economic combinations within the league and no employment of any form of economic boycott or exclusion except as the power of economic penalty by exclusion from the markets of the world may be vested in the league of nations itself as a means of discipline and control.

Fifth, all international agreements and treaties of every kind must be made known in their entirety to the rest of the world.

Special alliances and economic rivalries and hostilities have been the prolific source in the modern world of the plans and passions that produce war. It would be an insincere as well as an insecure peace that did not exclude them in definite and binding terms.

The confidence with which I venture to speak for our people in these matters does not spring from our traditions merely and the well known principles of international action which we have always professed and followed. In the same sentence in which I say that the United States will enter into no special arrangements or understandings with particular nations let me say also that the United States is prepared to assume its full share of responsibility for the maintenance of the common covenants and understandings upon which peace must henceforth rest. We still read Washington's immortal warning against "entangling alliances" with full comprehension and an answering purpose. But only special and limited alliances entangle, and we recognize and accept the duty of a new day in which we are permitted to hope for a general alliance which will avoid entanglements and clear the air of the world for common understandings and the maintenance of common rights.

I have made this analysis of the international situation which the war has created not, of course, because I doubted whether the leaders of the great nations and peoples with whom we are associated were of the same mind and entertained a like purpose, but because the air every now and again gets darkened by mists and groundless doubtings and mischievous perversions of counsel and it is necessary once and again to sweep all the irresponsible talk about peace intrigues and weakening morale and doubtful purpose on the part of those in authority utterly, and if need be unceremoniously, aside and say things in the plainest words that can be found, even when it is only to say over again what has been said before, quite as plainly if in less unvarnished terms.

As I have said, neither I nor any other man in governmental authority created or gave form to the issues of this war. I have simply responded to them with such vision as I could command. But I have responded gladly and with a resolution that has grown warmer and more confident as the issues have grown clearer and clearer. It is now plain that they are issues which no man can pervert unless it be wilfully. I am bound to fight for them, and happy to fight for them as time and circumstance have revealed them to me as to all the world. Our enthusiasm for them grows more and more irresistible as they stand out in more and more vivid and unmistakable outline.

Masses Know What They Are Fighting For

And the forces that fight for them draw into closer and closer array, organize their millions into more and more unconquerable might, as they become more and more distinct to the thought and purpose of the peoples engaged. It is the peculiarity of this great war that while statesmen have seemed to cast about for definitions of their purpose and have sometimes seemed to shift their ground and their point of view, the thought of the mass of men, whom statesmen are supposed to instruct and lead, has grown more and more unclouded, more and more certain of what it is that they are fighting for. National purposes have fallen more and more into the background and the common purpose of enlightened mankind has taken their place. The counsels of plain men have become on all hands more simple and straightforward and more unified than the counsels of sophisticated men of affairs, who still retain the impression that they are playing a game of power and playing for high stakes. That is why I have said that this is a peoples' war, not a statesmen's. Statesmen must follow the clarified common thought or be broken.

I take that to be the significance of the fact that assemblies and associations of many kinds made up of plain workaday people have demanded, almost every time they came together, and are still demanding, that the leaders of their governments declare to them plainly what it is, exactly what it is, that they were seeking in this war, and what they think the items of the final settlement should be. They are not yet satisfied with what they have been told. They still seem to fear that they are getting what they ask for only in statesmen's terms—only in the terms of territorial arrangements and divisions of power, and not in terms of broad visioned justice and mercy and peace and the satisfaction of those deep seated longings of oppressed and distracted men and women and enslaved peoples that see into them the only things worth fighting a war for that engulfs the world. Perhaps statesmen have not always recognized this changed aspect of the whole world of policy and action. Perhaps they have not always spoken in direct reply to the questions asked because they did not know how searching those questions were and what sort of answers they demanded.

World Wants Triumph of Justice

But I, for one, am glad to attempt the answer again and again, in the hope that I may make it clearer and clearer that my one thought is to satisfy those who struggle in the ranks and are perhaps above all others, entitled to a reply whose meaning no one can have any excuse for misunderstanding if he understands the language in which it is spoken or can get some one to translate it correctly into his own. And I believe that the leaders of the governments with which we are associated will speak, as they have occasion, as plainly as I have tried to speak. I hope that they will feel free to say whether they think that I am in any degree mistaken in my interpretation of the issues involved or in my purpose with regard to the means by which a satisfactory settlement of those issues may be obtained. Unity of purpose and of counsel are as imperatively necessary in this war as was unity of command in the battlefield; and with perfect unity of purpose and counsel will come assurance of complete victory. It can be had in no other way. "Peace drives" can be effectively neutralized and silenced only by showing that every victory of the nations associated against Germany brings the nations nearer the sort of peace which will bring security and reassurance to all peoples and make the recurrence of another such struggle of pitiless force and bloodshed forever impossible, and that nothing else can. Germany is constantly intimating the "terms" she will accept, and always finds that the world does not want terms. It wishes the final triumph of justice and fair dealing.

AERO CLUB OF AMERICA TO HAVE CLUB FOR ALLIED AVIATORS IN PARIS

AT a special meeting of the Executive Committee of the Aero Club of America, held September 30, at the clubhouse, 297 Madison Avenue, the club accepted the offer made by a prominent, wealthy, American in Paris, to establish a club for Allied aviators, to be maintained at his own expense for the Aero Club of America for the period of the war.

Recently the Aero Club of America was advised by the military authorities that there was pressing need for a home or club for tired aviators.

The Foreign Service Committee of the Aero Club of America, of which Ambassador William G. Sharp is Honorary Chairman, the membership of which included the most prominent Americans who reside in Paris, transmitted the information to Mr. Alan R. Hawley, the President of the Aero Club of America, and it arrived two days ago. Yesterday the club received a cable from the Foreign Service Committee in Paris, advising that Mr. Louis D. Beaumont, who is President of the May Department Stores Company of Cleveland, Ohio,

(*Continued on page* 190)

THE NEWS OF THE WEEK

American Caproni Gives Newspapermen Demonstration

The first all-American Caproni bombing biplane equipped with three Liberty motors flew over New York and Brooklyn just previous to the opening of the Liberty Loan Drive on September 27.

The biplane, piloted by Lieut. Giuliano Parvis, an Italian fighting pilot, recently arrived in this country, and Capt. Hugo d'Annunzio, son of the famous Italian poet of that name.

The captain is mechanical chief of the Caproni company, and he supervised the building of the plane.

As passengers these two had nine newspapermen, including two photographers.

The plane left the ground at Hazelhurst Field, Mineola, L. I., at 4:30 P. M., and it was just 5:45 when, after a thrilling corkscrew spiral from 4,000 feet in the air, it alighted gently within a couple of hundred yards of where it had started.

A good part of New York must have seen—and heard—the new American air monster. Briefly, the route was this: from Hazelhurst Field directly to New York, crossing the East River between the Manhattan and Williamsburg Bridges. Down the west side of Manhattan, out over the bay, circled twice above the Statue of Liberty, did a dive just after that, from 4,000 feet down to about 1,500; then went back over the city, keeping above Broadway and Fifth Avenue, to a point over the sheep meadow of Central Park, then down town again, directly above The World and Municipal Buildings and City Hall Park, then back up over Third and Fourth Avenues as far as the Queensboro Bridge, and thence eastward over Brooklyn and back to the starting point.

Speaking of the flight, one of the passengers, J. J. O'Neill, of the New York *World*, said:

"It seemed to all of us a very good thought that America now has a native-built plane, foreign though the design may be, that is capable of bombing the enemy's works or cities, that has the speed and strength to do it, that CAN do it, and it is to be hoped, SHALL do it.

"In addition to making a wonderfully successful demonstration of what this all-American machine can do we broke several records on the flight.

"In the first place, we reached a height of 2,700 metres—8,858 feet—with twelve persons, which is a new American altitude mark for any sort of machine carrying that number of persons. This high mark was attained just as we were coming upon the outskirts of Brooklyn (and a genial soul sitting next to me pointed down to the cluster of cemeteries beneath).

"Then we established a new record of a novel sort which was quite as interesting. This was a "low altitude" record. That is to say, we flew over the City of New York at a lower stage than any aeroplane of any sort had flown previously. The baragraph showed that we came down to within 200 metres—600 feet, roughly speaking—of the sidewalks. This was when we were passing close by the Metropolitan Tower at 23d Street and Madison Avenue.

"We were actually lower than the top of the tower as we swung along northward above Third Avenue. This was rather risky business, as the pilots cheerfully told us when we foregathered afterward on terra firma, but they wanted to show us, they said, that the plane could go anywhere."

New York Air-Raided by Liberty Planes

A novel air raid on New York City was carried out by the Italian and French aces on Saturday, September 28, for the Liberty Loan.

Capt. Jacques Boyriven and Lieut. Georges Flachaire, under the direction of Major Beroetta, of the French Aviation Mission to the United States, flew two fast Nieuport combat biplanes which were used at the recent Somme front by famous French aces, and which arrived in the United States recently. Lieut. Julian Parvis, the famous Italian ace, piloted the new American-made Caproni, which is equipped with three Liberty motors. His passengers were Capt. Hugo d'Annunzio, son of the noted Italian poet and aeroplane observer, and Lieut. Testoni. The Italian officers acted under the direction of Capt. Bevione of the Italian Aviation Mission.

The Caproni and the two Nieuports started from Mineola at five o'clock in the afternoon on September 28 and flew to New York.

The large Caproni represented a bombing machine starting out for a long bombing raid, and the two Nieuports served as escorts, and flew over it and around it as they would at the front if they had to protect it from the attack of the enemy fighting planes.

They flew to New York, and on arriving over Riverside Drive, the Caproni manoeuvred as it would in a raid, dropping bombs, and the Nieuport combat planes went through all the difficult stunts and turns which combat planes have to go through when fighting a large number of enemy planes.

Lieut. George Flachaire, the French Ace, who has spent some months in this country, and flew for the Fourth Liberty Loan. He was a pilot in the 67th Escadrille

Thirty thousand "aerograms," or paper bombs, were dropped by the aviators over New York City. Half of the bombs read:

WE HAVE FOUGHT FOR DEMOCRACY FOR FOUR YEARS!
HELP US WIN THE WAR
BUY LIBERTY BONDS!

These bombs will be dropped by French aviators from fighting Nieuports.

The other half bore the same legend but stated that they were dropped by Italian aviators from the Caproni bombing aeroplane, equipped with Liberty motors.

After bombing New York the planes gave an exhibition of the newest phases of aerial warfare, which is flying low and attacking enemy troops on the ground and in the trenches. To best demonstrate how the planes can fly low and get in and out of tight places, they flew under all the New York bridges.

The French and Italian aviators are very enthusiastic over the Liberty Loan, and they told the Aero Club of America authorities, Mr. Alan R. Hawley, President; Henry A. Wise Wood, Vice-President; and Rear Admiral B. A. Fiske and Henry Woodhouse, Members of the Board of Governors, that nothing would *encourage* the Allied forces, nor *discourage* the enemy more, than the overwhelming success of the Fourth Liberty Loan.

Aeroplane Assembly System Incorporated in Training Course

Washington.—A system of aeroplane assembly has been incorporated with the general training course at Kelly Field, Texas, for both cadets and student officers. This is a departure from the general curriculum, is not general and has not yet been approved by the training section. At present the work includes 12 days of instruction in putting together wings and fuselage only. The other parts of the plane will enter into instruction as the course advances, until the practical assembling of a complete aeroplane is a part of the instruction of every flier. It is expected that this will prevent carelessness, tendency to hurry the work or to overlook anything that may later endanger life. It will take the prospective flier completely through all the shops.

1,000 Planes Have Gone to Pershing

Washington.—A total of 1,440 De Haviland 4 aeroplanes have been delivered and 1,000 have been sent to France, members of the House Committee on Military Affairs were told at their weekly conference with Gen. Peyton C. March, Chief of Staff on September 27. All the Browning machine guns that can be utilized have been furnished, but it has been impossible as yet to build up a reserve sufficiently large for the requirements.

Photo shows, left to right, Colonel Milton F. Davis and Lieutenant-Colonel Mallard F. Harmon. Colonel Davis is in charge of all the training of the American flyers. He is engaged in hammering into shape the team that is going to demoralize the Huns as soon as they are ready to swarm across the German frontier. Lieut.-Colonel Harmon has just returned from the Western battle front, where he had charge of the American flyers. These two officers are playing a prominent part in the creation of an arm of the service that is destined to strike terror into the hearts of the Huns

A Nieuport biplane, which escorted the Caproni bomber on its Liberty Loan bombing expedition. Those aviators shown in the photograph flew for the Liberty Loan. They are, from left to right, Major Phipps, U. S. Air Service; Lieutenant Mandrot, French Air Service; Lieut.-Col. C. K. Rhinehardt, Commander of the 1st Provisional Wing, U. S. Air Service; Captain Boyriven, French Air Service, Instructor on Nieuport, Spad and other combat machines; Adjutant Ravis and Adjutant Royer. The Nieuport advanced training biplane, shown in the photograph, is Colonel Rhinehardt's machine, "Billiken". Captain Boyriven's clever Boston Terrier is shown on the cowl of the machine

Lieut. Campbell Shares in Prize

Lieut. Douglass Campbell of California, the first American-trained aviator to be officially cited as an ace, has been awarded part of the 10,000 francs offered jointly by the Duke and Duchess of Talleyrand and Curtiss Tilton of Philadelphia to the first five American aviators to down three Hun planes.

Others who will share in the awards will be Lieuts. Eddie Rickenbacher, John Mitchell and Sumner Sewall.

Lieut. Campbell filed his claim for the monetary prizes before he left Paris for San Diego. According to the rules, the prizes were open to aviators who went overseas with the first American forces. Veteran airmen who had been transferred to the American Air Service from other Allied branches were not eligible.

Campbell crashed his first Boche aeroplane near Toul on April 14 last, his second on May 18 and the third on May 19. Sewall destroyed his first Hun machine on June 3, his second July 16, and the third on July 25. Mitchell is credited with victories on May 27, May 30, and July 8. Rickenbacher downed his three between July 5 and August 2.

Lieut. Campbell left Rockwell Field the early part of this week for a short visit at his home in San Jose. He will return at an early date.—*Rockwell Field Flyleaf.*

New Identification Mark

From a German source the *Nieuwe Rotterdamsche Courant* learns that a change has been made in the marking on German machines. The arms of the black cross are now straight—and not curved—with white edges. The change is said to have been made because the previous form made recognition of German machines very difficult, and because it easily led to confusion with the circular signs on hostile aeroplanes.—*March Field Flyleaf.*

Aero Estimate Cut

The House Appropriations Committee today pared $1,000,000 from the maintenance and production item of the $170,000,000 aircraft estimate included in the $7,000,000,000 asked for by the War Department for its new man-power program.

The $1,000,000 was taken off after Chairman Sherley had elicited the information from War Department representatives who appeared before the committee that certain items in the maintenance and production estimates were also provided for in the quartermasters' and other departmental estimates.

Licenses for Air Flights

Licenses must be secured for experimental aeroplane flights, even at plants manufacturing planes for the army and navy, under a ruling announced on September 23 by the joint army and navy aeronautics board.

Flyer's Digits Freeze

Canton, Ohio.—What is thought by Capt. R. W. Schroeder, of Chicago, to be very nearly a new record in altitude was achieved by him in a test aeroplane flight from the Dayton aviation field to Canton. He ascended more than 28,000 feet, his records show. He found a temperature of 32 degrees below zero centigrade. His finger tips were frozen.

Joseph Pulitzer Joins Aero School

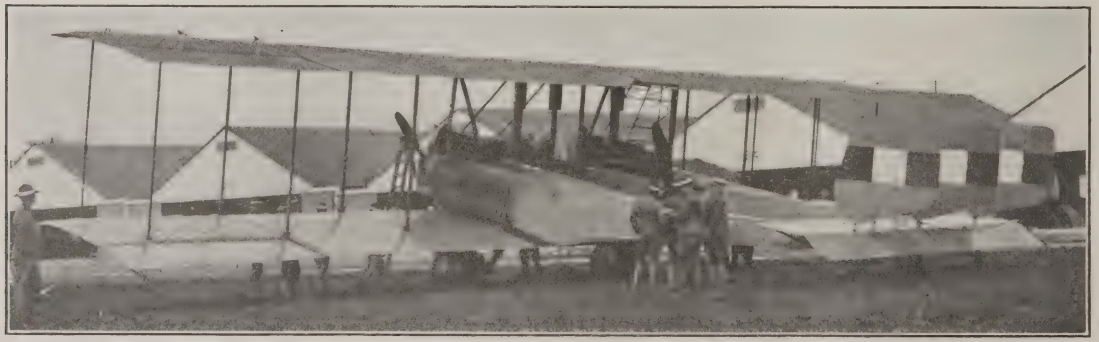
Chicago.—Joseph Pulitzer, editor of the St. Louis *Post-Dispatch* and director of the New York World Corporation, has enrolled in the aviation training school at Great Lakes naval training station, and has been given a temporary rating as chief quartermaster.

Calls Our Airmen Equal to British

With the American Army in France.—In the course of a statement on the extent and importance of the work of the British independent air force, Major Gen. Trenchard, its commander, spoke in highest praise of the American airmen. He said they were as good as his own men, and more praise he could not give, as he did not believe anything better could be said.

Their daring, ability, discipline, and organization could hardly by improved upon, said General Trenchard. He added that he recently bestowed the distinguished Flying Cross to an American airman.

Among some captured German letters that General Trenchard quoted was one describing the destruction wrought by Allied aircraft. This said that the Opera House and the greater part of the splendid street, "Die Zieh," in Frankfort was a heap of ruins and that 120 persons had been killed.



New Quick-Dodging Plane Used by Enemy

American Headquarters in France.—Patrols report having encountered an entirely new type of enemy aeroplane, designed especially to make it easy to manoeuvre. They also report that the Germans are adopting the parachute as a means of escape from damaged planes.

British, French and Italian Flyers Join with Americans

With the American Army on the Lorraine Front.—British aeroplanes, which are cooperating with American squadrons on this front, flew far back of the enemy lines on September 16 and bombed aerodromes at several places. Eleven tons of bombs were dropped on aerodromes at Longuyon, Boulay, Marhange and Bohm.

French and Italian units cooperated with American squadrons in carrying out nine missions, in addition to which patrolling and photographic work was successfully conducted.

The American-made Caproni which bombed New York from the skies with leaflets in aid of the Fourth Liberty Loan is equipped with three Liberty motors. It was piloted by Lieutenant Parvis, the noted Italian Ace, with Captain d'Annunzio and Lieutenant Belloni as passengers.

The AIRCRAFT TRADE REVIEW

Standard Inspectors Hold Annual Dinner

The first annual dinner of the Standard Aircraft Inspectors and the United States Government Inspectors stationed at the Standard Aircraft plant at Elizabeth, was held on Saturday, September 14th, at Sea Girt, N. J.

In addition to the inspectors, a number of the officials of the company were present.

Mr. J. M. Meirick, Superintendent of Publicity, acted as toastmaster.

Mr. A. M. Jeffords, Assistant General Manager, represented the management.

Addresses were made by A. M. Jeffords; William Tynam, Chief Inspector; Fred Sinon; Harry C. Austin; etc.

The toastmaster read letters from H. B. Mingle, President of the Standard Aircraft Corporation, and Edward E. Pennewill, Vice-President and General Manager of the Standard Aircraft Corporation.

The Government Inspectors who were present at the dinner, included the following: Mr. George M. Pace, Mr. Harry Austin, Mr. Eaton, Mr. O. Kalning, Mr. August Bauer, Mr. Robert Mason, Mr. Samuel Kriney, Mr. Augustus T. Schmidt.

Among the Standard Aircraft Corporation Inspectors who were present were: Mr. Russell O. Wirtz, Mr. Ed. J. Mansfield, Mr. Anthony E. Rubino, Mr. Charles Azzara, Mr. Louis Barbier, Mr. E. M. Morel, Mr. William Lean, Mr. Duncan MacKinnon, Mr. Frank Morris, Mr. Nelson Bordeaux, Mr. Arthur Weiber, Mr. Wm. Sandford, Mr. George Keller, Mr. Clarence Daly, Mr. Harry A. Cohen, Mr. Fred Scheidegger, Mr. Frederich Wm. Sinon, Mr. Andrew Guaniello, Mr. W. H. Rittenhouse, Mr. George Rhoderick, Mr. J. Roden, Mr. John H. Lizelan, Mr. Valentine Steenson, Mr. Flannery.

New Company to Build Aeroplanes

The Stacy Aeroplane Company of this city, has been granted incorporation papers by the Secretary of State.

This company has been organized by Charles E. Stacy and will manufacture aeroplanes with the use of patents owned by him and C. D. Stacy, his brother. The work of organizing the company will start at once and definite plans of operation will be announced in the near future.

Both brothers are engineers and machinists of experience, at present being employed by local firms.—Dayton *Evening Herald*.

Wings of German Aeroplanes Now Being Made of Wood

The Hague—The New York *Times* correspondent learns on excellent authority that the last German aeroplane to land in Holland was one of the Brandenburg type, which had wings covered with three thin layers of wood instead of textile material. The extra weight was saved by doing away with wire stays. The machine flew well.

The question of textiles and, in fact, of all materials has been one fraught with tremendous difficulties to Germany for some time and is one that monopolizes the attention of the experts, in spite of efforts to prove the contrary.

Graham W. Brogan, newly appointed advertising manager of the Duesenburg Motor Corporation

Automobile Shows Cancelled Because of War Exigencies

B. M. Baruch, chairman of the War Industries Board, authorizes the following:

The National Automobile Chamber of Commerce has canceled the national automobile shows of 1919, to have been held during January and February in New York and Chicago, at the request of Bernard M. Baruch, chairman of the War Industries Board, and George N. Peek, commissioner of finished products.

Going further to meet the views of the War Industries Board, the automobile industry leaders have urged promoters of local shows for automobiles, trucks, or accessories to abandon all plans for such during the coming winter.

The reason given to the industry for this action by the Automobile Chamber of Commerce is a desire to co-operate with the War Industries Board in plans for conservation of fuel, labor and transportation.

The question of advisability and practicability of holding these shows, both national and local, was taken up with Messrs. Baruch, Peek, Alexander Legge and Judge Edwin B. Parker, of the War Industries Board, by Hugh Chalmers and Alfred Reeves, of the National Automobile Chamber of Commerce, and Mr. Peek strongly urged that all such exhibitions be abandoned for the winter. Mr. Chalmers presented the views of the War Industries Board to his chamber of commerce and Mr. Peek has received from Mr. Reeves, general manager of the chamber, a letter stating that the directors of the chamber concurred unanimously in the opinion of the board and has adopted the following resolution:

"*Resolved*, That the promotion of national automobile shows during the winter of 1918-19, with consequent use of transportation, fuel and labor, would, in the opinion of this board, be inconsistent with the patriotic obligations of the industry and that, therefore, national shows be suspended until further action of the association.

"*Resolved*, That for reasons expressed in the foregoing resolution, promoters of local and other shows be respectfully requested not to hold automobile, truck or accessories exhibitions during the winter of 1918-19."

Standard Fabric for Aeroplne Wings

Government tests of silk for aeroplane wings were made last year, and now there has been a cotton fabric evolved instead. It is reported that one of the largest mills in Phiiadelphia is virtually ready to manufacture aeroplane cloth in large volume.

The standard cloth, textile experts say, is a cotton fabric of great strength, with almost no "stretch" to it. It is regarded as equal in every way to the linen cloth used by England, although it is a trifle heavier. Mill conditions are such that orders for millions of yards can be handled with comparatively no trouble.

Ball Bearing and Steel Ball Industries Recognized as Essential

The Priorities Division of the War Industries Board, in circular No. 19, dated September 3, 1918, has placed manufacturers of ball bearings and steel balls on the Preference List with a rating of "Class B-3," conditioned upon their executing and filing pledges of co-operation with and observance of the rules of the Priorities Division.

Overland Gets Curtiss Engine Contract

Washington.—The Willys-Oevrland Co. has received a contract for 1,500 Curtiss O. X.-5 aeroplane engines of the 8-cylinder type, to be used in training planes.

Washington Office for Duesenberg

Washington.—The Duesenberg Motors Corp. has established a Washington office in the Munsey Bldg. It is in charge of General Sales Manager N. G. Rost.

Glenn L. Martin Tests First Plane

Cleveland.—The first plane produced by the Glenn L. Martin Co. has been completed and has flown from Cleveland to Dayton for experimental tests with a crew of four men.

Aerial Mail Scores 100%

The Aerial Mail has scored 100% daily for September, including the rainy period of the last of the month. The worst day was on September 18, when the planes left Washington and New York in the midst of rainstorms. On that day it was raining so hard that the machine had to be started in the hangar, Aviator Shank leaving Washington in a downpour of rain, the landing gear of his plane sinking in the mud up to the hubs in parts of the field and making the take-off from the ground very difficult. Notwithstanding the stormy weather, he made the trip from Washington to New York in three hours and five minutes. He flew nearly the entire distance through rain and storm and landed in rain both at Philadelphia and New York.

Aviator Max Miller on September 19 flew to Clarion Pa., to chart a more favorable route across the mountains in Pennsylvania than is found on the air line from Belmont to Cleveland.

U. S.-Spain Aero Mail Service Is Proposed

Madrid, Spain.—Captain Herrera, chief of the Spanish military air force, has had a number of interviews with King Alfonso on the subject of an aerial postal and passenger service between Spain and the United States. The scheme also has been discussed at cabinet meetings, and it is said that a leading shipping company is willing to finance it.

Will Relay New Aero Mail

New York.—The feasibility of the government's plan to transport mail by aeroplane and make final delivery of letters, between New York and Chicago within a maximum time of 10 hours, has been demonstrated, in the opinion of postal officials and officers of the Aero Club of America. This opinion was expressed after Max Miller, arriving here from Chicago by way of Cleveland and Lock Haven, completed the first round trip aero post flight between this city and Chicago.

On his journey to Chicago last week Miller, battling against adverse weather conditions at times, made the flight in an elapsed flying time of about nine hours. On his return journey, begun in Chicago, Miller consumed eight hours and 42 minutes.

Under the government's plans for a regular aero post between New York and Chicago, beginning October 1, mail will be carried in relays, three aviators carrying the mail instead of one.

Miss Stinson Again Flies Mail

Miss Katherine Stinson, who made her first trip as a member of the air mail staff on September 26, flying from Washington to Belmont Park, was ready for her second flight on September 27, and was favored with pleasant though windy weather. She got away from the Belmont Park station at 12:12 P. M. with pouches containing 150 pounds of mail, and Pilot Maurice Newton flew another plane carrying an equal amount, both starting about the same time and reaching Philadelphia at 1:22. From there they went on, after a short stop, to Washington.

Pilot Robert Shank brought in the northbound mail, making the trip from Philadelphia to Belmont Park in fifty minutes. The large volume of mail carried in the last two days is due in part to the fact that boxes with the aero mail service signs have been installed in the hotel lobbies from which collections by motorcycle are made just before the time for the dispatch of the messages to the aero mail stations.

Do You Use the Aerial Mail Service Regularly for Your Urgent Correspondence With Philadelphia and Washington? It May Interest You to Know the Following Facts

The Aerial Mail Service operates with clock-like regularity between New York and Washington.

The aeroplane leaves New York every week day without fail at 12 o'clock noon and arrives at the Philadelphia field at 1 p.m. and at the Washington field on or before 3 p.m.

Northbound, the aeroplane mail leaves Washington at 11.30 a.m. every week day without fail, arrives at Philadelphia at 1.10 p.m., and lands at the New York terminus of the route on or before 2.30 p.m.

During the month of August every foot of the route was flown without a miss and without a single serious delay. The mail from Washington to New York was late as much as one hour only once during the month, whereas the fixed schedule for arrival in New York was beaten 14 times. On August 21st the mail plane landed at 1.58 p.m. with the mail that left Washington at 11.30 a.m.

The best time from New York to Washington, including the mail stop at Philadelphia, was 2 hours and 30 minutes, and the best time from Washington to New York, including the Philadelphia stop, was 2 hours and 28 minutes.

Compare this for speed and regularity with the fastest train service between New York and Washington, which is approximately 5 hours, and about 5 hours and 30 minutes as an average for all the other fast through trains.

Compare this record with the time it takes for the transmission and delivery of the average commercial telegram. Neither train nor telegram are more regular and more certain in their delivery performances than is the aerial in any kind of weather as it is now operated by the Post Office Department.

An aeroplane letter mailed from New York is delivered to the addressee in Washington *before close of business the same day.*

Aeroplane mail receives special treatment from the time it is mailed until it is placed in the hands of the addressee.

The rate of postage is 16 cents for the first ounce, including Special Delivery Service, and 6 cents for each additional ounce.

The Postmaster can advise you as to the latest time in the forenoon that aeroplane mail may be deposited at the various stations for dispatch that same day.

OTTO PRAEGER,
Second Assistant Postmaster General

September 7, 1918

NOTE—Mail deposited at any one of the above points up to ten minutes before last collection is made will be dispatched same day. Mail deposited after last collection will go forward via first train and be given special-delivery service unless instructions are given to hold same until following day for dispatch via aeroplane.

MILITARY AEROSTATICS

By LIEUT. H. K. BLACK, R. F. C., C. F. A.

So far as the naval balloons were concerned they were housed in special balloon ships, which had a hold fitted up for the reception of the gas bags. On land it was another matter. It was almost a universal accepted theory that balloons would be houses in wooden or canvas hangars, the same as aeroplanes are at the present time. Active service and the advent of the aeroplane, however, made it evident that some new means of housing a balloon was advisable. The hangars were very easily spotted from the air and owing to their gaseous occupant were particularly vulnerable to enemy artillery fire and later to enemy incendiary bombs. Besides hangars were rather a nuisance. They were unwieldy and hard to transport. Unlike an aeroplane, which can reach the battle front in a very few minutes from its aerodromes away behind the lines, a balloon must be fairly close to the place it is going to do its work. To walk a balloon overland requires the efforts of the whole crew and a very tedious job it is. That procedure also requires an absence of overhead wires, a state of things which is very seldom the case near the front in France. In windy weather even the combined efforts of the whole crew would probably not be sufficient to take the balloon any distance safely. So events proved that a balloon must be bedded down fairly near to the winch position. As the erection of hangars so close to the enemy was impracticable, a bed on the ground was devised. Some experiments along that line had been carried out in England before the war, and these formed the basis of new experiments on active service

Several things are essential in the contructions of a good balloon bed. Probably the most important is protection. This point subdivides itself into two parts, first protection from the weather and second from the inquisitive eyes of wandering Boche airmen and ground observers. The latter are usually not very hard to circumvent, that is, given any decent kind of country. It is surprising just how much protection even a very small rise in the ground will give. So long as the ground line of where the balloon rests on the ground is not visible to the enemy it is very difficult for him to notice the balloon at more than five thousand yards. The airman is not so easy to fool. Owing to its regular more or less cylindrical shape it is unmistakable from the air. Camouflage well applied, is distinctly effective. Not the wierd color combinations which one sees so much of in this country but a quiet breaking up of the regular lines with color and a harmony with the surroundings. I remember on one occasion I was beautifully fooled and incidentally, unwittingly, caused quite a flutter in the company. While we were operating a balloon on the Arras sector just behind the one-time village of Souchez, the section on our right, for some reason or other, I forget what, got a new balloon. Instead of being a dark green as most of the balloons are colored, it was a very irregular grey. Quite mottled in fact. As the fortune of war had it, their suroundings were almost the same color, to wit, an old shell torn wood. I happened to be in the air one day when a message came through asking if Number —was in the air. I cast a glance over my shoulder and failed to see the sausage up. For no particular reason I glanced at the ground to see the balloon on its bed. I did not know they had received a new balloon and I didn't see it lying there. I reported that Number — was not only not in the air but that the balloon was not visible on the ground either and that probably it had blown off its bed during the night. Some excitement ensued on the ground. It was only after looking very carefully with high-powered binoculars that I was able to discern their sausage on its bed. It was the best example of camouflage I have ever seen. Just here it might be said that balloons when exposed to the wind, the rain and the sun, will fade out whatever color they may have. At the time referred to above, my section was using an old French balloon which whatever color it had been to begin with, was at that time almost pure white. The only time it would have been protected naturally would be the middle of winter. A place in a thin wood, or between several rows of trees, other things being equal, will generally make very good protection both from the weather and the enemy.

The observation balloon in the navy. These balloons, which ride 3000 feet or more above the surface of the ocean, are sometimes flown from a destroyer though more often they are flown from a regular balloon ship, which has special facilities for handling them. They are used for spotting submarines and are sometimes used in a trans-Atlantic convoy. They are used for coast defence observation and were designed for observation of fire from battleships at very long ranges. Their vulnerability to aeroplane attack was against them though

THE INCREASING OF POWER OUTPUT*

Including Reference to a Six-Stroke Engine

By PROF. EMIL SCHIMANEK

THE power output of an internal combustion engine is evidently improved if the amount of fuel consumed per unit of capacity can be increased, and the more effectively the heat capacity of the fuel is utilized the better will be results.

The quantity of fuel which can be consumed is evidently in direct proportion to the charge of air in the working cylinder, other factors remaining unaffected, and it is therefore possible to increase the power output by increasing the air charge and by improving the thermal efficiency.

To increase power output then, effort in the following directions may be made:

1. To increase thermal efficiency.
2. To increase the number of working strokes per unit of time—
   - *a.* By increasing the revolutions per minute.
   - *b.* By reducing the number of idle strokes; employing the two-stroke cycle instead of the four-stroke.
3. To increase the air charge in the working cylinders, *i. e.,* consuming a greater quantity of air for a given number of strokes.

1. The overall thermal efficiency can only be increased (assuming the mechanical and indicated efficiency to remain unaltered) by increasing the expansion ratio after the combustion of the gases. If we consider similar cycles—*i. e.,* approximately constant volume or constant pressure cycles—in which the volume at the end of expansion is equal to the volume at the beginning of the compression, then the increase in expansion ratio is equivalent to an increase in compression ratio.

Theoretical considerations and practical results have shown that, after a certain limit is reached, the advantage of further increasing the compression ratio is very small. For instance, a constant pressure cycle engine working with a compression of about 38 to 40 atm. could scarcely be improved by increasing the compression. We can scarcely expect a further increase in power output from this direction therefore.

2a. The increase in the number of working strokes per unit of time by increasing the number of revolutions per minute is very effective in augmenting the power output, and is, of course, very general.

2b. Reducing the number of idle strokes has been effected successfully in double-acting engines, also in employment of the two-stroke cycle instead of the four-stroke. With the two-stroke engine, one stroke is required for the expansion, while the remaining stroke may be used either for the exhaust or for the compression. As the compression is essential from a thermal point of view, and as this compression can scarcely be performed elsewhere than in the cylinder itself without entailing considerable losses, it is the usual practice with two-stroke engines to perform the compression during the other stroke. The scavenging and charging of the working cylinder with fresh air is performed during a short portion of the stroke near the dead centre. This requires, besides the working cylinder, a pumping cylinder, taking air in and transferring it to the working cylinder.

During the transfer period the working cylinder is scavenged with the help of the new air charge. Theoretically it would be sufficient to make the cylinder volume of the pump equal to the volume of the working cylinder. As, however, it is impossible to prevent a certain amount of air escaping with the exhaust gases during the scavenging period, and so being lost for combustion, it is the usual practice to make the volume of the pumping cylinder at least 30 per cent larger.

In order to establish a comparison between the four and the two-stroke engines with regard to the necessary cylinder volume per unit of power, we have to add for the two-stroke engine the volume of the pumping cylinder, neglecting

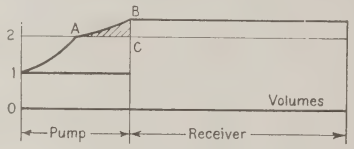

Fig. 1.
Diagram of pump.

for the moment designs employing the crank case as the pump.

Assuming the two-stroke to give twice the power of the four-stroke engine, we obtain for the former, for the same power output, the proportion

$$\frac{\text{Cylinder capacity}}{\text{Power output}} = a = \frac{2.3}{2} = 1.15$$

of that of the four-stroke, *i. e.,* 15 per cent larger. The use of double-acting pumps alters the proportion to

$$a = \frac{1.65}{2} = 0.825.$$

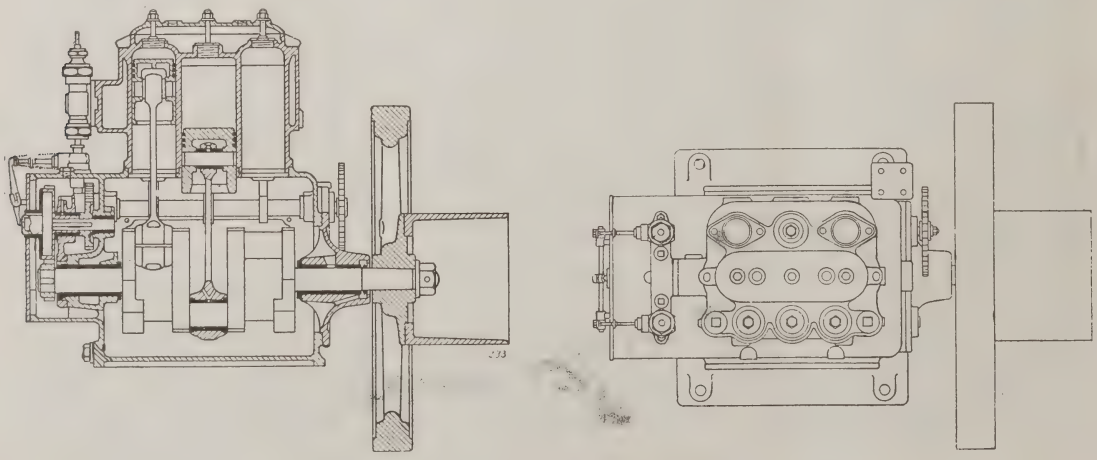
Assuming the two-stroke to give only 1.8 times the power of the four-stroke, the proportion will be

$$a = \frac{1.65}{1.8} = 0.917.$$

The proportions represented by *a,* which will be calculated in all the following comparisons, show the proportion of the total volume of the cylinders of the engines to be discussed to the cylinder volume of the ordinary four-stroke engine for equal power output.

It will be noted that the proportions given in all cases hold good only for the cylinder volume, and should not be considered in relation to the weight of the engine. It is evident that for the same cylinder volume the pumps will be lighter than the working cylinder, including piston and crankshaft, on account of the smaller pressures for the pump.

3. The power increase due to the increase of the air charge in the cylinder of a given volume can be achieved—



- *a.* By a decrease of the air temperature.
- *b.* By reducing the exhaust residue in the combustion chamber and replacing the corresponding volume by fresh air.
- *c.* By increasing the air pressure before compression.

As examples of 3*a* we may mention the difference of power output between air-cooled and water-cooled engines, also the cooling of the air for two-stroke engines during the transfer period from the pump to the working cylinder, as proposed by Prof. Junkers. The power output at this lower temperature is also increased on account of the better thermal efficiency. The increment is due to the fact that the specific heat of the gases increases with the temperature. This increase is evidently the smaller the larger the air charge, which is consequently less contaminated by the remaining exhaust gases.

The power increase which can be obtained by cooling the air before the compression is limited by the temperature of the cooling water. By calculating the necessary cylinder volumes of the working cylinders for the same power output, no account is taken of the various air temperatures, because the proportions vary greatly for various fuels, and mixtures of fuel and air, due to the specific heats. Neglecting this variation in thermal efficiency, and assuming that the specific heats and weights of the air and exhaust residue are the same, we shall need for equal power output an increase of cylinder volume almost proportional to the increase of absolute temperature of the charge.

The method set forth in 3*b* has been employed by the Premier Gas Engine Co. for their four-stroke scavenging engines. In these the exhaust residue is expelled from the combustion chamber with compressed air. Also the Hellmann four-stroke engine with complete scavenging may be mentioned.

With the Premier engine the air pump delivers the total air charge, while in the Hellmann engine the pump supplies only the necessary

Figs. 2 and 3.
Four-stroke engine with power increase.

* Translated from an article published in *Zeitschrift des Vereines Deutscher Ingenieure.*

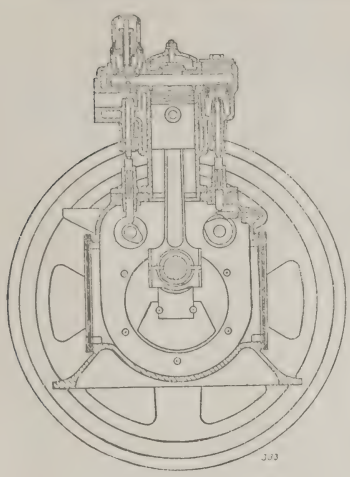


Fig. 4.

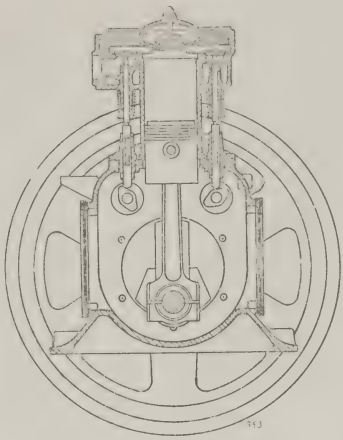

Fig. 5.

quantity of air to scavenge and charge the compression space. The total volume of the working and pumping cylinder is for both machines evidently larger than for the ordinary four-stroke.

To the same group of engines belong also the six-stroke engines, in which two further strokes are added to the normal four strokes, during which the pistons draw in air only, expelling it again through the exhaust valve.

In considering this cycle of operations we must take into account the fact that in the scavenging of the cylinder during the fifth and sixth strokes a cooler charge will result, which increases the thermal efficiency; also the compression space is charged with fresh air, and we can therefore expect a greater economy. Because more fuel has to be consumed during one cycle the thermal efficiency will be adversely affected, and on account of the two additional strokes the mechanical efficiency is not so good.

A calculation could only be made by adopting several assumptions; therefore we will dispense with this, and merely point out that all the methods of operation under 3b are only employed with engines having a large compression space. With high-compression engines (Diesel engines) this method is of no practical value.

In method 3c—that of charging the working cylinder with air—higher pressure can be effected in the simplest manner with two-stroke engines by increasing the air pumping cylinder. If we assume, as before that the air loss during the scavenging amounts to 30%, and if we make the pumping cylinder 2.3 times as large as the working cylinder, and, furthermore, assume isothermal compression and no throttling losses, we obtain a pressure of 2 atm. in the working cylinder after the transfer. Twice the amount of air is consumed, and we may expect, therefore, twice the power output, other conditions remaining unaltered. Evidently the compression pressure will be twice as high as before. The air pump may either deliver the air in two portions—one portion practically at atmospheric pressure for scavenging and charging the cylinder, and the other portion at higher pressure in order to raise the pressure in the cylinder. In the case of the Junkers engine the exhaust is throttled to such an extent that the lowest pressure in the working cylinder corresponds with the pressure of the charging air. If the exhaust is throttled down to 2 atm. absolute the theoretical power output is doubled.

An example of dividing the air portions into two portions is found in the single-acting two-stroke engine of Sulzer Bros., of Winterthur. In this engine the cylinder is scavenged with an open exhaust, and, after closing the exhaust ports, air at higher pressure is admitted.

With regard to the thermal efficiency and power increase, the method of the Junkers is not so good: First, because the whole amount of air has to be compressed to the high pressure, and, secondly, because some exhaust gases are likely to remain in the cylinder. The position of the inlet and exhaust ports at opposite ends of the cylinder in the Junkers engine has, however, some tendency to diminish the last-named detrimental effect.

The advantage of this two-stroke engine over the four-stroke, with regard to the necessary cylinder volume, is the more marked the higher the charging pressure. If, for instance, we charge with air at 1.5 atm., and assuming isothermal compression, no throttling losses, and double power output as compared with the four-stroke, also double-acting pump, we then arrive at a cylinder volume of working and pumping cylinder of $1 + \frac{1.8}{2} = 1.9$ times as great, while the power output is three times as great. The proportion of the necessary volume to that of the four-stroke engine for the same output is

$$a = \frac{1.9}{3} = 0.63.$$

If the charging pressure is 2 atm., the proportion works out at

$$a = \frac{1 + \frac{2.3}{2}}{4} = 0.504.$$

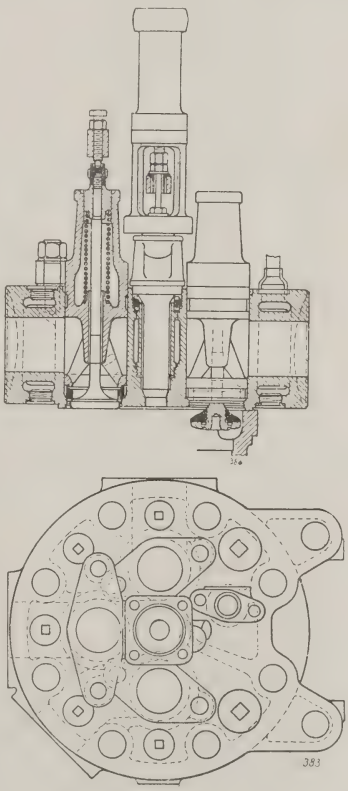
It is also possible to increase the power output of the four-stroke engine by charging the cylinder with compressed air. The engine takes in its charge from a receiver filled with compressed air, the supply being maintained by means of a pump. The necessary total cylinder volume for a given power output is dependent on the charging pressure, or, in other words, on the desired power increase. With a charging pressure of, say, 2 atm. the power output is double that of the ordinary four-stroke engine. If the pump, which is delivering every alternate stroke, is single-acting, it will require the same volume as the working cylinder, and if double-acting, only half this volume. The volume proportions for the same power output are: In the first case $a = 1$, and in the second case $a = 0.75$. With a charging pressure of 1.5 atm., $a = 1.166$ and 0.913 respectively.

It is also possible, however, to supply by the pump only one portion of the total charge, while the other portion is drawn in by the working cylinder at atmospheric pressure.

The cycle of operation of such an engine is as follows: The piston at the first stroke draws in air from outside. At the end of the suction stroke, after the inlet valve is closed, the cylinder is brought into communication with a receiver containing compressed air supplied by a pump. This air is transferred into the working cylinder and raises the pressure. Then follow the compression, expansion, and exhaust strokes as usual.

If, for instance, the pump supplies the receiver with exactly the same quantity of air as the working cylinder draws in from outside, then we have, after the transfer, *i.e.*, before the compression, a pressure of 2 atm. in the cylinder, assuming isothermal compression in the pump and transfer without losses at the dead centre. The power output will be twice as large as for the ordinary four-stroke. The total volume of working and pumping cylinder, with a single-acting pump, will be $1 + 0.5 = 1.5$, and the proportion $a = \frac{1.5}{2} = 0.75$, on account of the double power output. With a double-acting pump we have

$$a = \frac{1 + 0.25}{2} = 0.62.$$



Evidently this proportion is more favorable than that for the two-stroke engine without power increase, as the pump has also to supply the extra amount of air lost during the scavenging period. The advantages over the two-stroke are, therefore, no loss of air and a better exhaust. The disadvantage is the higher pressures in the working cylinder. In the above example the pressures are twice as high as in the two-stroke without power increase.

The thermal efficiency of this engine is not so good as that of the ordinary four-stroke. This will be the more pronounced the smaller the receiver is for the compressed air. This is due to the fact that the air has to be transferred from the receiver at higher pressure in the cylinder at lower pressure, neglecting even the losses on account of the acceleration and throttling of the air.

This loss can be approximately illustrated in the pump diagram (for isothermal compression). The area ABC (fig. 1) illustrates the loss, which evidently increases with the receiver pressure. With an indicated mean effective pressure of 10 atm., and a receiver volume equal to twice the volume of the pumping cylinder, this loss amounts to 1.15% of the indicated power of the working cylinder.

Figs. 2 to 5 illustrate an engine working on the above principle. The central cylinder is the pumping cylinder, while the two outer cylinders are the working cylinders. The valves are disposed on both sides of the cylinder. The transfer valve is in connection with a ring space by means of several holes, whereby the fuel is atomised as the air under pressure is admitted. The pistons of the fuel pumps are operated upwards by a cam on the camshafts, while a spring controls the return stroke. A centrifugal governor (not shown) is mounted in the gear, which governs the stroke of the fuel pump's pistons by interposing a wedge. The experiments with this engine were not completed at the time these notes were prepared, but the preliminary tests confirmed the theoretical conclusions regarding the power output.

It is also possible to increase the power output without the addition of a special air pump

by employing more than four strokes, namely, by arranging several suction strokes before each compression and expansion stroke. The air taken in before the last suction stroke is pumped into a receiver and stored there until at the end of the last suction stroke—*i.e.*, before the compression stroke—it is transferred back into the cylinder to supplement the charge. The total charge is therefore accumulated during the successive suction strokes. The six-stroke engine (see fig. 6) may serve as an example. The six strokes are—

First stroke: Suction of air from outside (line A—B).

Second stroke: Compressing the air into the receiver (line B—C).

Third stroke: Suction of air from outside (line C—D).

Between the third and fourth stroke: Transfer of the air from the receiver into the cylinder, increasing the pressure to about 2 atm. (line D—E).

Fourth stroke: Compression of the charge (line E—F).

Fifth stroke: Combustion and expansion (line F—G).

Sixth stroke: Exhaust (line G—H).

By this cycle of operations we consume during six strokes twice as much air as during the four strokes of the four-stroke engine. For the same number of revolutions, therefore, the power output of the six-stroke is $\frac{2 \times 4}{6} = 1.33$ times that of the four-stroke. For the same cylinder capacity we obtain, therefore (without transfer losses), almost 33% more power.

In Table I. are tabulated the necessary total volumes of working and pumping cylinders for the theoretical power output of the previously discussed cycle of operation.

An eight-stroke engine would have the following cycle of operations:

First stroke: Suction of air from outside.

Second stroke: Compression of the air into a receiver.

Third stroke: Suction of air from outside.

Fourth stroke: Compression into the receiver.

Fifth stroke: Suction of air from outside.

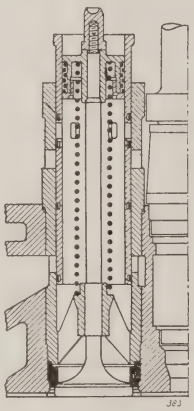

Fig. 12.
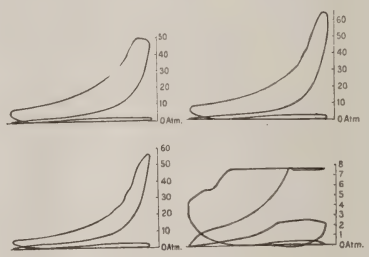
Combined suction and transfer valve with sleeve valve distributer.

Between the fifth and sixth stroke the air stored in the receiver is transferred back into the cylinder, in which the pressure will rise to about 3 atm. absolute; then follows the

Sixth stroke: Compression.



Seventh stroke: Combustion and expansion.

Eighth stroke: Exhaust.

The power output would be about 50% larger than that of the four-stroke.

In practice the six-stroke engine offers considerable promise. First of all, it is advisable to study the probable influences which may effect the 33% increase in power output as previously estimated.

It was assumed that during one cycle the six-stroke consumes twice as much air as the four-stroke on account of the two suction strokes

Figs. 15, 16, 17, and 18

preceding the combustion. In fact, there exist only during the first suction strokes the same conditions as in the case of the four-stroke. At the beginning of the second suction stroke, the combustion chamber of the cylinder is filled with air at receiver pressure, and the volumetric efficiency is influenced by the expansion of this air to atmospheric pressure. During the second and the following (with eight or more strokes) suction strokes the volumetric efficiency is only then high if the combustion chamber is not too large. The use of this principle is therefore restricted to such engines as have a high compression—*i.e.*, constant pressure cycle engines. If the volume of the receiver is four times that

of the working cylinder, and if the compression space is 8% of the cubic capacity of the cylinder, we shall have about 92% of the cylinder volume filled with fresh air at the end of the second suction stroke. During the first suction we shall also have a little loss on account of the exhaust residue expanding first. This loss of air charge is insignificant with the six and four-stroke and can be neglected. The charge of the six-stroke will therefore not be double that of the four-stroke, but only 1.92 times as great. With the same compression space, the pressures during the compression and expansion will be 1.92 times as great as those of the four-sroke. As mentioned before, this increase in pressures exists with all the cycles working with an increased air charge. However, with the six-stroke these pressures occur only during each sixth stroke.

Professor Junkers, in his article in *Der Oelmotor*, gives some valuable information on the admissible pressure increase. The article shows clearly the possibility of working with high pressures without any practical disadvantages.

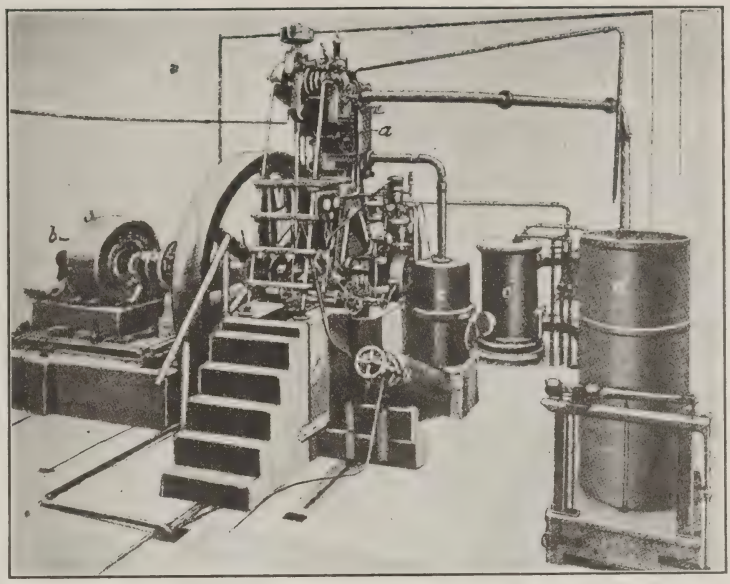
With the six-stroke, however, we have to consider the following: As a rule the necessary dimensioning of an engine is governed by the highest pressures on account of the material stresses. With constant pressure cycle engines using compressed air for starting, this pressure is not the compression pressure before the combustion, but the pressuse resulting at the first combustion in the cylinder when starting. Normally this pressure is not higher than 60 atm. With the six-stroke any desired compression can be obtained during the starting period. Before the starting operation the receiver is at atmospheric pressure, and during the starting this pressure increases according to the quantity of air stored gradually, until after several revolutions equilibrium exists between the pressures, depending on the size of the receiver. However, by opening a cock in the receiver any desired pressure may be maintained in the receiver during the starting period. This controls the pressure at the beginning and the end of the compression stroke, which can be regulated as desired, and there need be no higher pressures during the starting period, therefore, than is the case with the four-stroke.

The ignition of the fuel can be assumed to be just as certain as with the four-stroke, because during the starting period only a negligible quantity of heat is carried away through the receiver wall on account of the relatively low temperature of the stored air and the small heat conductivity of the latter, also the temperature loss is made good again through the increase in temperature due to the throttling effect during the transfer. The maximum temperatures of the compression cannot therefore materially differ from those of the four-stroke with the same pressures.

The maximum pressures can be limited to 60 atm., and the sizes and strength of parts can be left the same as for the four-stroke.

If in spite of this we have to limit the compression pressure to 50 atm. in the six-stroke, we have to increase the compression space accordingly, thus somewhat reducing the thermal efficiency and also the power output. If we operate the four-stroke with a compression pressure of 35 atm. and the six-stroke with only 50 atm., then the proportion of thermal efficiencies of constant pressure cycles at the highest outputs is in the proportion of about 109 to 100, considering the variation of the specific heat.

The effective power output is influenced not only by the thermal efficiency of the cycle, but also by the heat losses to the cooling water and mechanical efficiency, and we may now discuss what effect the six-stroke cycle has on these.



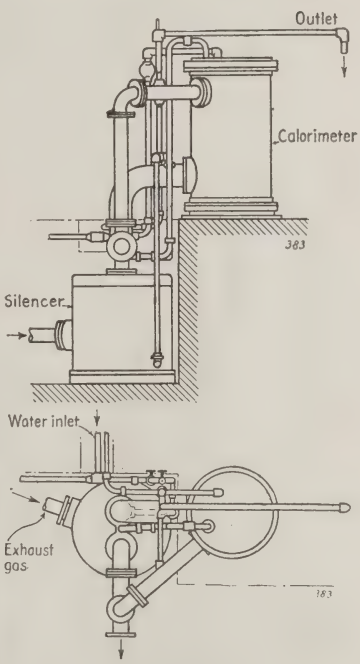


Fig. 13.—See description of Fig. 14

It is known with the four-stroke that the water cooling has no effect on the heat utilisation for the power output during the suction and exhaust strokes, and only a small effect during the compression stroke. Only during the combustion and expansion has the heat loss of the charge a detrimental effect on the heat utilisation. For the six-stroke engine there are five strokes during which the cooling water has little or no detrimental effect. If, therefore, the temperatures during the combustion and expansion do not materially exceed those of the four-stroke, which can easily be assured by cooling the receiver, then the heat loss to the cooling water for the same number of revolutions for the six-stroke is smaller than for the four-stroke. The resulting gain in power can only be estimated. Using the method of E. Meyer, this gain works out, roughly, from 4% to 5% of the indicated power; 4% has been adopted for the further calculations.

The mechanical efficiency of the six-stroke engine is bound to be better than that of the four-stroke engine. The friction losses are only dependent on the pressure—*i.e.*, on the load. The greater power output of the six-stroke therefore assures a better mechanical efficiency. Based on results from Diesel engines, this gain may be estimated at 5% to 6% of indicated power. It is assumed, however, that this gain is counterbalanced by the losses of transfer of air into the receiver and back into the cylinder.

The effective power output of the six-stroke is therefore, for the same dimensions and same compression space,

Figs. 19 and 20.
Water-cooled silencer with calorimeter.

$$1.33 \times \frac{1.92}{2} \times 1.04 = 1.33$$

that of the four-stroke. Limiting, however, the compression pressure to 50 atm., the power output on account of the above mentioned influences is

$$\frac{1.33}{1.09} = 1.22$$

that of the four-stroke engine.

In order to determine the power output and heat balance of the six-stroke engine, Ganz and Co., of Budapest, have fitted a four-stroke Diesel

THIRD ANNUAL REPORT OF THE NATIONAL ADVISORY COMMITTEE ON AERONAUTICS

(*Continued from page* 139)

Meteorology and Aeronautics

IN the field of meteorology, the committee recommended to the President an appropriation for the extension of the aerological work of the United States Weather Bureau, and in accordance with which an appropriation of $100,000 was made by Congress for this work, with special reference to the securing of more comprehensive observations on the air in aid of aviation. The committee also acted in cooperation with the United States Weather Bureau in placing meteorological exhibits at the First Pan American Aeronautic Exposition.

In August, 1917, the Advisory Committee recommended that there be organized under the Chief Signal Officer of the Army, as a war measure, a military aerological service with necessary stations and equipment, both in the United States and abroad, and that this service be organized in full cooperation with the Weather Bureau and with care to avoid duplication.

A special report on meteorology and aeronautics has also been prepared and issued as Technical Report No. 13.

Board of War Inventions in Aeronautics

Soon after the declaration of hostilities with Germany the Chief Signal Officer of the Army called to the attention of the committee the large amount of material which was coming before the War Department, comprising inventions and suggestions relating to aeronautics in warfare, and asked assistance in examining and disposing of such material. Accordingly, this committee, through an appropriate subcommittee appointed for the purpose, has acted as a board of inventions for the Government in matters relating to aeronautics, and since the outbreak of hostilities between the United States and Germany it has weekly examined hundreds of suggestions and inventions pertaining to this subject and referred to it by the War and Navy Departments, in addition to the suggestions and inventions which come direct to the committee. This work has required a large amount of time and careful study and has called for considerable increase in the technical and clerical staffs of the committee in order to care for the very large amount of examinations, study, and correspondence with inventors regarding these matters. Several suggestions of value have been received and brought promptly to the attention of the particular Government office most directly interested.

Definition of Technical Terms

During the year the committee has given further attention to the subject of the definition and standardization of technical terms used in aeronautics, and has prepared a further edition of its bulletin on the subject of nomenclature (Technical Report No. 15).

Metric System for Drawings and Calculations

On recommendation of the Advisory Committee, in December, 1916, the War, Treasury, Interior, and Commerce Departments adopted the metric system of weights and measures for all drawings and calculations on aeronautical matters, for use with the accompanying English equivalents. Due to the exigencies of war activities, however, the metric system has not been used generally by the War Department.

Aerial Mail Routes

In December, 1916, the subject of cooperation with the Post Office Department in the establishment of aerial mail routes was considered, and the same matter in one form or another has been considered from time to time since that date. Recently the Second Assistant Postmaster General has expressed a desire to develop such routes in a trial way and so far as military requirements may permit furnishing the needed equipment and personnel. The committee is prepared to advise with and aid the Post Office Department in the furtherance of these aims.

Civil Aerial Transport

In the latter part of 1917 the general subject of civil aerial transport was brought to the attention of the committee and a special subcommittee was appointed to take under consideration the various phases of civil and commercial uses of aeronautics, with special reference to the conditions which may be expected to develop at the close of the war.

Landing Field for Transient Aviators

In connection with the accommodation of transient aviators in Washington, the committee cooperated with the War Department in the selection of a tract of land on the Eastern Branch of the Potomac River and southeast of the Washington Navy Yard.

Productive Capacity of Aeronautic Industry—Inspection Trips

During November, 1917, members of the Advisory Committee in two different groups made trips of inspection to the three principal centers of aeroplane production, namely, Dayton, Ohio; Detroit, Mich.; and Buffalo, N. Y.

The purpose of these trips was to place the committee in immediate contact with the conditions in the industrial field and give them an opportunity of forming a personal, first hand judgment regarding the productive capacity for aeroplanes and for aeronautic engines as provided by the facilities developed at that date, and as contemplated in plans for further development.

The members of the committee have been very favorably impressed with the serious energy and purpose with which the manufacturers are approaching the problem of the quantity production of aircraft and aircraft engines, and with the productive capacity which is now rapidly approaching the point of effective service. Counting on a similar spirit and purpose throughout the field of aircraft industry, there seems every reason to anticipate productive capacity adequate to meet the needs of the Government.

Technical Reports

The first annual report of the committee contained technical reports Nos. 1 to 7, and the second annual report Nos. 8 to 12. With this, the third annual report, the committee submits technical reports Nos. 13 to 23, as follows:

Report No. 13, entitled "Meteorology and Aeronautics" was prepared by Prof. William R. Blair, in charge of aerological investigations, United States Weather Bureau, and submitted through the subcommittee on the relation of the atmosphere to aeronautics. This report discusses problems and general phenomena of the atmosphere. On request of the Signal Corps, it has been printed as a separate document by the committee for widespread distribution, as it contains information of special value to all aviators and aeronauts.

Report No. 14, entitled "Experimental Research on Air Propellers," was prepared and submitted by Dr. William F. Durand, chairman of the National Advisory Committee for Aeronautics. A brief description of this report is contained under "General problems and activities," paragraph E. It has been printed by the committee as a separate document for immediate distribution in order to supply much-needed information at the earliest moment to those who are interested in the design of air propellers.

Report No. 15, entitled "Nomenclature for Aeronautics," was prepared and submitted by the subcommittee on nomenclature for aeronautics, of which Dr. Joseph S. Ames is chairman. It has been printed by the committee as a separate pamphlet.

Report No. 16, entitled "The Stretching of the Fabric and Deformation of the Hull in Full Balloons," is a translation from the German, by Prof. Karl K. Darrow, of the University of Chicago.

Report No. 17, entitled "An Investigation of the Elements which Contribute to Statical and Dynamical Stability and of the Effect of Variation in those Elements," was prepared by Prof. Alexander Klemin, of the Massachusetts Institute of Technology, under contract entered into by the committee with Prof. C. H. Peabody, of the same institution.

Report No. 18, entitled "Aerofoils and Aerofoil Structural Combinations," is a graduating thesis prepared at the Massachusetts Institute of Technology by Maj. H. S. Martin, S. C., and Maj. E. S. Gorrell, S. C., and has been included in the present report by the committee on account of the importance of the information which it contains.

Report No. 19, entitled "Periodic Stresses in Gyroscopic Bodies with Application to Air Screws," was prepared and submitted by Dr. A. F. Zahm of the Washington Navy Yard.

Report No. 20, entitled "Aerodynamic Coefficients and Transformation Tables," was prepared by the committee under direction of Dr. Joseph S. Adams, member.

Report No. 21, entitled "Theory of an Airplane Encountering Gusts, II," was presented as a paper before the American Philosophical Society by Prof. E. B. Wilson, of the Massachusetts Institute of Technology, being a continuation of a report on the same subject printed in the first annual report of the committee. For this reason and in order to complete the treatment of the subject in the records of the committee this paper is included in the present report.

Report No. 22, entitled "Fabrics for Aeronautic Construction," was prepared by Mr. E. D. Walen, of the United States Bureau of Standards, and submitted through the subcommittee on standardization and investigation of materials. This report consists of two parts, the first dealing with cotton fabrics intended for the covering of aeroplane wings and the second with balloon fabrics.

Report No. 23, entitled "Aeronautic Power-Plant Investigations," was prepared by Dr. H. C. Dickinson, of the United States Bureau of Standards, and submitted through the subcommittee on power plants. This report consists of three parts. The first, entitled "Performance of Aeronautic Engines at High Altitudes," gives a description of the construction and equipment of a special testing laboratory intended to furnish, under control, the operating conditions of an aeronautic engine at high altitudes and under any desired conditions of air density, temperature, and humidity. Part 2, entitled "Radiator Design," gives a description of special apparatus designed and constructed for the investigation of different types of radiator sections and with a view to the development of the better knowledge of the interrelation among the various factors entering into radiator performance. Part

The French "Corps d'Armée" Letard biplane equipped with two Hispano-Suiza motors

3, entitled "Spark Plugs," gives a description of a series of tests on different types and forms of spark plugs and of measurements intended to indicate the relation between the various factors affecting performance of the same.

General Problems and Activities

The general problems enumerated in the preceding annual reports of the committee constituted the program of work during the past year. Progress has been made in the scientific study and solution of these problems which are considered of immediate importance, and they will be attacked on a larger scale by the committee with the increased facilities which will be available on completion of the committee's research laboratory at Langley Field.

A. *Stability as determined by mathematical investigations.*—The literature on this subject has been augmented by a report (No. 21) entitled "Theory of an Airplane Encountering Gusts, II," prepared by Prof. E. B. Wilson, of the Massachusetts Institute of Technology, in continuation of his report on the same subject contained in the first annual report of this committee.

Report No. 17, entitled "An Investigation of the Elements which Contribute to Statical and Dynamical Stability and of the Effects of Variation in Those Elements," contains valuable information from the standpoint of inherent stability, and also gives data on static longitudinal balance heretofore unavailable to the designing engineer.

B. *Air-speed meters.*—The complete air-speed meter involves an indicating instrument and a head for the production of pressure difference, which may be either a Pitot or Venturi tube or a combination of the two. The French use almost entirely the Venturi-Pitot; the English, the Pitot with accompanying static tube. With a view to diminishing the danger of clogging the tube with water, Dr. A. F. Zahm, of the Washington Navy Yard, has inverted the mount on the Venturi-Pitot combination so that draining is more certain, and also used a larger cross-section of throat and connecting tubes than has been common abroad. This tube gives a difference of pressure almost exactly proportional to the square of the speed, and though considerably heavier than the English Pitot tube, it permits of the use of a more rugged indicating instrument. The recently improved Foxboro indicating instrument is considerably reduced in size and behaves very well under the trying conditions of vibration experienced on an aeroplane, but the scale is very far from uniform. The production of a uniform scale is the next improvement to be desired, and development is being pushed with several types. Maj. C. E. Mendenhall, a member of the subcommittee on instruments, has in hand a large number of problems.

C. *Wing sections.*—Several aerofoil sections designed by officers of the Signal Corps and tested in the Massachusetts Institute of Technology wind tunnel give promising results. A description of these aerofoils and the data obtained from the tests are embodied in Report No. 18.

D. *Engines.*—The most notable development in aeronautic engines in America during the past year has been the Liberty engine designed under the direction of the Aircraft Production Board and embodying the best American ideas in combination with information from Europe regarding the best foreign designs, and made available during the early summer of 1917.

D-1. The manufacture of the Hispano-Suiza engine has been successfully developed in the United States during the past year, and certain other engines of foreign design have been likewise modified with reference to economical quantity production by American manufacturers.

D-2. An experimental study of the fundamental principles of radiator design, with particular reference to the effect of air velocity and density on the cooling capacity of various possible types of cellular construction, was undertaken in May, 1917. For the purposes of this investigation, a comprehensible experimental plant has been constructed at the Bureau of Standards and specimen radiators have been obtained from most of the manufacturers of automobile as well as aeronautic radiators. This group of specimens includes not only a wide variety of types of construction, but several series of specimens differing in one respect only, as for instance, cell length. Measurements are being made for this group of specimens of the cooling capacity, head resistance, weight, water capacity, resistance to water flow, air cell dimensions, etc.

D-3. During the present year suitable testing equipment has been installed at the Bureau of Standards for the carrying on of an extended experimental program on aircraft engine performance with special reference to high altitude conditions. The "altitude" laboratory planned for these investigations comprises the following equipment:

A reinforced concrete chamber, in which engines may be run at reduced pressures of below one-half atmosphere; a 300 horsepower dynamometer for absorbing and measuring the power output; an enhaust blower of sufficient capacity to carry off the exhaust from the engines under test and to maintain the reduced pressure in the test chamber; a refrigeration plant for cooling the intake air and the air circulation in the chamber; fans for producing circulation in the test chamber; and equipment for measuring all quantities necessary for a complete record of engine performance.

One of the Liberty engines (eight cylinder) now in place in the test chamber is being studied for the effects of altitude and fuel changes. Following this it is expected that the twelve cylinder model will be studied, then other engines, particularly those especially designed for high altitude flying, will be taken up.

D-4. The study of performance and causes of failure of spark plugs has developed a large number of parallel investigations. The causes of failure are numerous, including mechanical (accidental) breakage, cracking due to thermal expansion, gas leakage under compression, fouling with soot, or carbon deposit, and "cut-out" or short circuiting as the insulator becomes conducting at high temperatures.

The latter, while perhaps not the most common cause of failure, offered the most promise of valuable results from a laboratory investigation, hence the greater share of time has been devoted to it. Satisfactory laboratory methods have been developed for measuring and specifying the relative merits of different types of spark plugs as regards "cut-out."

Reasonably satisfactory methods for testing for gas leakage and liability to breakage from sudden heating have been developed.

Specifications for acceptance tests of spark plugs have been prepared in cooperation with the inspection section of the Signal Corps, and tests under these specifications have been carried on at the Bureau of Standards, where the spark-plug investigation is in progress. These tests include not only laboratory tests, but endurance tests in an engine.

D-5. A method of measuring vapor pressures of gasolines has been developed and the necessary equipment nearly completed. This work is now being carried on at the University of Virginia by a member of the faculty who spent the summer at the Bureau of Standards perfecting the program and building the experimental apparatus.

Work on the latent heats of fuels has only recently been undertaken at the Harvard laboratory, where space and shop facilities are available. Trial apparatus for this work is under construction, but the final design of experimental esuipment has not yet been perfected.

E. *Propellers.*—During the year an investigation has been carried out on model propellers, the results of which are given in Report No. 14. A series of model propellers selected for this investigation have been taken with a view of regular distribution among the various properties and characteristics, such as pitch, form of blade, blade width, form of blade section, etc. These tests are intended to form a basis for comparison with experiments carried on in other laboratories, and also with the system of theoretical design now in common use and first enunciated by Drzewiecki. They are also intended to serve as a basis of comparison with coefficients of the performance of full-scale propellers in order to provide much-needed information regarding the relation between model and full-scale experiments. It is a part of the program held in view to test a certain number of full-sized propellers representing a distributed selection of the model forms. The results of such tests will then serve to connect directly the model tests on the corresponding forms with full-sized tests, and, presumably, by extension the coefficients thus developed may be used for the entire series of model experiments.

A further contract has been made with Dr. W. F. Durand, to be carried out at the aerodynamic laboratory at the Leland Stanford, Jr., University, covering a large number of further investigations in the field of air-propeller performance.

F. *Form of aeroplane.*—During the year there has been carried on at the Massachusetts Institute of Technology on behalf of the committee an investigation on this subject by Prof. Alexander Kelmin, the results of which are published in Report No. 17.

A large amount of experience with full-sized machines in Europe, especially under war conditions, has contributed greatly to a better understanding of this important problem, and in particular much available information has been acquired regarding the factors involved in inherent stability.

G. *Radiotelegraphy.*—During the year the committee has carried on active work on the subject of radiotelegraphy in cooperation with various other agencies engaged in the study of this problem. The best form of generator for use on airplanes has been given careful study, and it has been developed (*a*) that 500 cycle alternating current generators, giving 1,000 sparks per second, and of an output of 500 watts can be and have been made, which will satisfy all the requirements of the Army and Navy which were imposed; (*b*) a vacuum tube oscillator for telephonic communications between aeroplanes has been developed, giving satisfactory results.

The porblem of receiving wireless signals has also been investigated and it has been established that a very efficient receiving set employing the sound method is practicable. The question of detecting and locating hostile aeroplanes or airships before they are seen, or heard by the unaided ear, has also been investigated, but without thus far fully satisfactory results.

H. *Bibliography of aeronautics.*—A bibliography of aeronautics was published by the Smithsonian Institution in 1909. The committee has well in hand the extension of this work up to January, 1917, and it will be published as soon as completed.

(To be continued.)

77 Planes Soar in Mineola Group

The greatest spectacle Mineola's aviation fields has ever witnessed was a formal inspection on the morning of September 27 by Major Gen. William L. Kenly, Director of Military Aeronautics, of "Group A" of the Reserve Wing.

Seventy-seven planes lined up in a row more than a quarter of a mile long, each pilot at attention, Gen. Kenly, in a blue De Haviland, driven by Col. C. K. Rhinehart, the Wing Commander, "taxied" up and down the long line on the ground and looked them over. There were four squadrons of eighteen machines each, and a few extra ones. Each squadron's machines were painted a distinctive color.

As he reached the end of the lines Gen. Kenly's machine took him aloft about 2,000 feet. Meanwhile all seventy-seven propellers were started whirling. Then, one after the other, the long line of "ships" took to the air. Each plane sought out its squadron mates of the same color, and then the whole fleet broke up into fighting formations of five planes to the unit, flying in V-shapes. They remained aloft about twenty minutes and then the show ended.

Travel by Aeroplane

London.—Six members of the party of American editors, who are visiting English war plants and the battle fronts as guests of the British Government, flew from England to France on September 26. They were Dr. Wheeler, of *Current Opinion;* Fred W. Kellogg, of the San Francisco *Call;* S. J. Duncan Clarke, of the Chicago *Post!* Ellery Sedgwick, of the *Atlantic Monthly;* Dr. Vanhise, president of Wisconsin University, and Charles Towne, of *McClure's Magazine.* The remainder of the party made the trip by boat.

AGC—Report to Aviation Supply Depot, Garden City, L. I., N. Y.
AHT—Report to Aerial Gunnery School, Houston, Texas.
AIR—Transferred to the Air Service, National Army, without change in rank or date of commission.
ALF—Report to Camp Alfred Vail, Little Silver, N. J.
AMV—Report to Aviation General Supply Depot, Morrison, Va.
AOV—Report to School for Aerial Observers, Hampton, Va.
APR—Report to School of Aerial Photography, Rochester, N. Y.
ARV—Report to Aviation Supply Depot, Richmond, Va.
ASM—Report to Aviation Mechanics' Training School, St. Paul, Minn.
BFT—Report to Barron Field, Fort Worth, Texas.
BRN—Report to Bakers Field, Rochester, N. Y.
BST—Report to Brooks Field, San Antonio, Tex.
CAF—Report to Carlstrom Field, Arcadia, Fla.
CAP—Commissioned as Captain, Aviation Section, Signal Corps.
CDT—Report to Aviation Concentration Camp, Dallas, Texas.
CFT—Report to Carruthers Field, Fort Worth, Texas.
CGC—Report to Aviation Concentration Camp, Garden City, L. I., N. Y.
CGS—Report to Aviation Concentration Camp, Greenville, S. C.
CIT—Report to Radio School, Carnegie Institute of Technology, Pittsburgh, Pa.
CJS—Report to Camp Jackson, Columbia, S. C.
CJW—Report to Camp John Wise, San Antonio, Texas.
CLR—Commissioned as Colonel, Aviation Section, Signal Reserve Corps.
CMV—Report to Aviation Concentration Camp, Morrison, Va.
CPA—Commissioned as Captain Air Service, National Army.
CPR—Commissioned as Captain, Aviation Section, Signal Reserve Corps.
CRI—Report to Chanute Field, Rantoul, Ill.
CSO—Report to the Chief Signal Officer, Washington, D. C.
CUI—Report to School of Military Aeronautics, Cornell University, Ithaca, N. Y.
CWT—Report to Call Field, Wichita Falls, Texas
DAF—Report to Dorr Field, Arcadia, Fla.
DAP—Report to Director of Aircraft Production, Washington, D. C.
DIK—Report to Camp Dick, Dallas, Tex.
DIS—Honorably discharged from service.
DMA—Report to Director of MilitaryAeronautics, Washington, D. C.
ELA—Report to Eberts Field, Loanoke, Ark.
EOT—Report to Ellington Field, Olcott, Texas.
FLA—Commissioned as First Lieutenant Air Service, National Army.
FLR—Commissioned as First Lieutenant, Aviation Section, Signal Reserve Corps.
FLT—Commissioned as First Lieutenant, Aviation Section, Signal Corps.
FOB—Report to Fort Omaha Balloon School, Omaha, Neb.
FRF—On duty requiring regular and frequent aerial flights.
FSO—Report to Fort Sill School for Aerial Observers, Fort Sill, Okla.
GIT—Report to School of Military Aeronautics, Georgia Institute of Technology, Augusta, Ga.
GLC—Report to Gerstner Field, Lake Charles, La.
HHN—Report to Hazelhurst Field, Mineola, L. I., N. Y.
JMA—Rated as Junior Military Aviator.
JRC—Report to Jackson Field, Riverside, Cal.
KST—Report to Kelly Field, So. San Antonio, Tex. (When specified in the order, the number of the field is given in parentheses)
LDT—Report to Love Field, Dallas, Tex.
LHV—Report to Langley Field, Hampton, Va.
MAC—Report to March Field, Allesandro, Cal.
MAJ—Commissioned as Major, Aviation Section, Signal Corps.
MAT—Report to Mather Field, Sacramento, Cal.
MDO—Report to McCook Field, Dayton, Ohio.
MIT—Report to School of Military Aeronautics, Massachusetts Institute of Technology, Boston, Mass.
MJA—Commissioned as Major Air Service, National Army.
MJR—Commissioned as Major, Aviation Section, Signal Reserve Corps.
MSC—Report to Radio School, Maryland State Agricultural College, College Park, Md.
OBS—Attached to the Aeronautical Service as Observers.
OSU—Report to School of Military Aeronautics, Ohio State University, Columbus, Ohio.
PFO—Report to Post Field, Fort Sill, Okla.
PMT—Report to Park Field, Millington, Tenn.
PUP—Report to School of Military Aeronautics, Princeton University, Princeton, N. J.
PWM—Report to Payne Field, West Point, Miss.
REL—Relieved from present duty.
RSD—Report to Rockwell Field, San Diego, Cal.
RTR—Retransferred to organization attached to previous assignment to aviation duty.
RWT—Report to Rich Field, Waco, Tex.
SBI—Report to Scott Field, Belleville, Ill.
SAG—Report to Souther Field, Americus, Ga.
SGS—Report to Camp Sevier, Greenville, S. C.
SLA—Commissioned as Second Lieutenant Air Service, National Army.
SLR—Commissioned as Second Lieutenant, Aviation Section, Signal Reserve Corps.
SLT—Commissioned as Second Lieutenant, Aviation Section, Signal Corps.
SMM—Report to Selfridge Field, Mount Clemens, Mich.
SRC—Report to Columbia School for Radio Officers, New York City.
TFT—Report to Taliaferro Field, Fort Worth, Texas. (When specified in the order, the number of the field is given in parentheses)
TMA—Report to Taylor Field, Montgomery, Ala.
UCB—Report to School of Military Aeronautics, University of California, Berkeley, Cal.
UIU—Report to School of Military Aeronautics, University of Illinois, Urbana, Ill.
UTA—Report to School of Military Aeronautics, University of Texas, Austin, Tex.
VBW—Report to Vancouver Barracks, Washington.
WAC—Report to Aviation Concentration Camp, Waco, Tex.
WCS—Wire to the Chief Signal Officer upon arrival.
WDM—Wire, Director of Military Aeronautics, upon arrival.
WFO—Report to Wilbur Wright Field, Fairfield, Ohio.

Was ist das? A German nightmare seaplane designed, apparently, to be offensive to the vision as well as the enemy. The tractor airscrew can be seen in the front of the small nacelle underneath the gunner's perch. The machine is believed to be called the "Ursinus," possibly because it was built by the motor firm of that name, and is said to have been designed by the Editor of "Flugsport"

Another view of the quaint German seaplane which is faintly reminiscent of an experimental aeroplane built in the early days of the war, and called the "Sparrow"

FOREIGN NEWS

GREAT BRITAIN

On Sept. 8 the sky was overcast, and there were frequent rain storms with high wind. Our aeroplanes carried on their work for the artillery with difficulty, and also accomplished a number of reconnoissances and contact patrols. Five tons of bombs were dropped during the day.

There was no flying at night. The activity of the enemy's machines was very slight, but we brought down five and drove two down out of control. None of our machines are missing.

Owing to continued heavy rainstorms on Sept. 10, aerial observation was very difficult. In spite of a very high wind some work was accomplished during the fine intervals which occurred from time to time.

Several reconnoissances were carried out by our machines, and some photographs were taken. One of our aeroplanes failed to return.

An official statement issued September 14, describing the British aerial activities over the battle area, says:

On September 13 clouds and rain again greatly interfered with operations in the air. During the brighter interval a number of photographs were taken, and our machines made observations whenever possible for the artillery fire.

Contact patrol work had to be carried on at a very low altitude. One enemy machine was brought down in air fighting during the day and two were driven down out of control. At night two hostile night bombing machines were brought down.

Ten tons of bombs were dropped by us in the course of the twenty-four hours. All our machines employed during this period have returned.

In conjunction with the attack by the American First Army the following operations were carried out: On September 13, in addition to the bombing reported in the communique of September 13, nearly a ton of bombs were dropped on the railways at Arnaville and Metz-Sablons. Two enemy aircraft were shot down out of control.

On the night of September 13-14 attacks were carried out on the railway at Courcelles, but owing to the weather results were difficult to observe.

On September 14 the railway at Metz-Sablons and Ehrang and the Buhl aerodrome were attacked with good results. Three direct hits were obtained on the railway at Ehrang and one on a shed at the Buhl aerodrome. Nearly six and one-half tons of bombs were dropped during the day and night. One of our machines is missing.

The statement of September 15 says:

On the battle front, in addition to the bombing reported in yesterday's communique, the following bombing operations were carried out:

Two further attacks were made on Metz-Sablons in the late afternoon and many direct hits were obtained on the railway triangle, on the workshops, the gas works and the barracks. The Buhl aerodrome was also attacked with good results.

Heavy attacks were kept up throughout the night of September 14-15 on Metz-Sablons, Courcelles, Ehrange, Sarbrucken, Kaiserslautern and the aerodromes at Frescaty and Boulay. Many direct hits were obtained on the railway, especially at Metz-Sablons and Courcelles, and several fires were started at Metz, Kaiserslautern, the Saarbrucken station, and the Frescaty aerodrome. Three of our machines failed to return.

This morning the railway triangle at Metz-Sablons was again attacked and many direct hits were obtained. Enemy scouts were active. Bombs were also dropped on the Buhl aerodrome. Three of our machines are missing.

The Daimler Works at Stuttgart were also attacked with good results. During this raid twenty enemy aircraft were encountered and two were destroyed. Our machines all returned safely.

The total weight of bombs dropped during the twenty-four hours was more than twenty-seven tons.

On September 14 the enemy aircraft showed more activity on some parts of the British front than for several days past. In air fighting four hostile machines were destroyed. In addition, two enemy two-seaters were burned on the ground in the course of a successful attack carried out by our airmen from a very low height upon an aerodrome south of Lille. Four German balloons were shot down in flames. Two of our machines are missing.

A good deal of photography and artillery observation work was accomplished, together with a number of contact patrols.

Twenty-one German towns have been bombed by the British independent air force during the month of August. The objectives were railway stations, chemical and other factories and blast furnaces, and the towns included Frankfort, Mannheim, Metz-Sablons, Saarbruck, Thionville, three times each; Burbach, Coblenz, Cologne, Darmstadt, Karlsruhe, Luxembourg, Offenburg and Treves.

The total weight of bombs dropped in these raids was more than 100 tons.

During the last three months the independent air force has made 249 aerial raids over German territory. The extensive damage done has been confirmed by photographs in many cases. The German territory thus brought definitely into the war zone represents a belt in the Rhine Valley approximately 250 miles in length.

On September 15, with the improving weather, there was a marked increase of aerial activity. Enemy machines were encountered in large formations on the German side of the line and there were many combats.

Twenty-nine hostile aeroplanes were destroyed in the air fighting during the day and seven were driven down out of control. In addition, a large enemy night bombing machine was brought down after dark. Sixteen of our machines are missing, including two night flying aeroplanes.

Four enemy aerodromes were successfully attacked and heavily bombed, one by day and three by night. During the twenty-four hours thirty tons of bombs were dropped by us.

Our balloons took advantage of the clear atmosphere to send down many useful observations, and our aeroplanes engaged in reconnaissance, photography and observation for artillery fire carried out much valuable work.

On the battle front on the night of September 15-16 four hostile aerodromes were heavily and repeatedly attacked by our machines with excellent results. Four fires were started, three hostile machines on the ground were wrecked, two hangars were completely demolished and sveral more hangars received direct hits. A transport convoy was hit four times.

The railways at Metz-Sablons were again bombed and a fire started. The railway junctions at Mainz and the sidings at Karlsruhe were successfully attacked.

Very good results were observed on both targets, and at Karlsruhe, where three and a half tons of bombs were dropped, seventeen direct hits were obtained. During the night 350 bombs, totalling sixteen and a half tons in weight, were dropped.

All of our machines returned.

There was great aerial activity all along the British front September 16 and our machines were busily engaged in every department of their work. Photographic reconnaissances, both of forward and distant areas, were carried out with great completeness in spite of strong opposition, and the number of aerial photographs taken exceeds any previously recorded total for one day.

Nearly twenty-four tons of bombs were dropped by day, and fifteen tons the following night, on aerodromes used by the enemy's night flying aeroplanes and on railheads and dumps.

The fighting was intense all along the front throughout the day, combats taking place a considerable distance east of the lines. Forty-five hostile machines were brought down by our airmen. Of these, seven were brought down in one fight by one of our squadrons. Twenty other German machines were driven down out of control. In addition, one hostile aeroplane was shot down by our anti-aircraft guns. One hostile balloon was destroyed.

Sixteen of our machines are missing.

On the afternoon of September 16 our squadrons made two separate attacks on the aeroplane works and chemical factory at Mannheim with excellent results. The enemy attacked our machines over the objectives. Three of our machines are missing.

A German home defence aerodrome at Hagenau was attacked by a squadron and bursts were observed on and near the hangars. One hangar was seen in flames. All our machines returned.

Last night our machines attacked three hostile aerodromes with bombs and machine-gun fire. Good results were obtained.

The railways at Metz-Sablons and Treves were very heavily attacked and three fires were started at Metz-Sablons. Bombs were dropped all around the Treves station. The station at Frankfort was also heavily attacked and bombs were dropped with good effect.

Sixty tons of bombs have been dropped in the last three days.

The official report for September 18 says:

"During the last forty-eight hours Royal Air Force contingents working with the navy have dropped thirteen tons of bombs on the docks at Bruges and on the Maria Alter aerodrome. Eleven enemy machines and a kite balloon were destroyed, and seven machines driven down out of control. Four of our machines are missing.

"A formation of five enemy seaplanes approaching the east coast was met and engaged by two seaplanes and two aeroplanes. One German machine was destroyed, the others retiring eastward."

After their heavy losses on the previous day enemy aircraft were less active yesterday. The weather on the British front was fine, with a strong wind.

Our machines were at work all day carrying out reconnaissances and photography far behind the German lines; observing and reporting the effect of our artillery fire and bombing enemy aerodromes, ammunition dumps and other selected targets. Eleven hostile machines were destroyed and five others driven down out of control. Ten of our machines are missing.

At night we heavily bombed three German aerodromes, where squadrons working in the battle area are located. Three hostile night-bombing machines which came over our line were detected by our searchlight, attacked from the air, and brought down. One of our night-flying aeroplanes is missing. The total weight of bombs dropped by us during the twenty-four hours was twenty-nine and a half tons.

Field Marshall Haig gave out the following on September 19:

"Yesterday the enemy aircraft activity was slight. Four hostile planes were brought down and three others were driven down out of control. Four of our machines are missing.

"Our planes kept in touch with the advancing troops and assisted in the attack of bombing and with machine-gun fire, as well as by reporting many targets to the artillery. During the twenty-four hours sixteen tons of bombs were dropped."

ITALY

A squadron of bombing machines dropped several tons of bombs on the Navy Yard of Pola with very good results on September 20. Two enemy aeroplanes were brought down and three others forced to land out of control.

Major Gabriele D'Annunzio, at the head of the pilots who made the raid on Vienna, was presented by King Victor Emanuel, the High Decoration of "Officer of the Military Order Savoy." A dozen of the British pilots on the Italian front received the Italian silver medal for valor.

After the ceremony there was the largest review yet held of the Italian Flying Corps.

The aerial activity of September 22-24 was handicapped by the bad weather prevailing on the whole front; nevertheless, three enemy aeroplanes were brought down by our pursuit machines.

Major Gabriele D'Annunzio, starting from the Italian front on September 26, flew to Paris, crossing the Alps. It is understood that he will take charge of a very important project.

The official statement issued by the War Office on Sept. 20 says: "Our aviators bombed Pola."

GERMANY

The German official statement says:

"Lieut. Buechner achieved his thirtieth aerial victory.

"On Sept. 23rd Lieut. Rumey gained his forty-first aerial victory."

This statement says that seventy-nine persons were killed and 113 injured during the allied air raids.

The statement of Sept. 26th says:

"Seven aeroplanes were shot down out of enemy squadrons which attacked Frankfort-on-Main and Kaiserlautern."

MODEL NEWS

Edited by John F. McMahon

Model Aeroplane Building as a Step to Aeronautical Engineering

(Construction of a 20-Foot Glider)

THE glider about to be described is for use in getting our first feeling of real flying. Of course the speed will not be as great as would be attained by a powered aeroplane, but it is much the same as the rolling chair used by infants in learning to walk. It leaves the ground but stays at a safe distance and moves so slowly that if an accident should occur, the striking impact would not be great and nothing other than a little shaking up would result.

To fly a glider, the operator can select one of two methods. One is to select some piece of ground a little higher than the surrounding country, face into the wind, run and cast off at the edge of the rise of ground, the glider will then carry you to a distance of about 200 or 300 feet, according to the skill of the operator.

The other method is to fasten ropes to the end of each wing and have it towed by a few men or a motorcycle. This method must not be attempted until the operator has practiced the other style, because there is danger of the motorcycle towing too fast with the result that the glider will shoot high in the air and the operator not knowing how to right it, it will come crashing to the ground with perhaps fatal results.

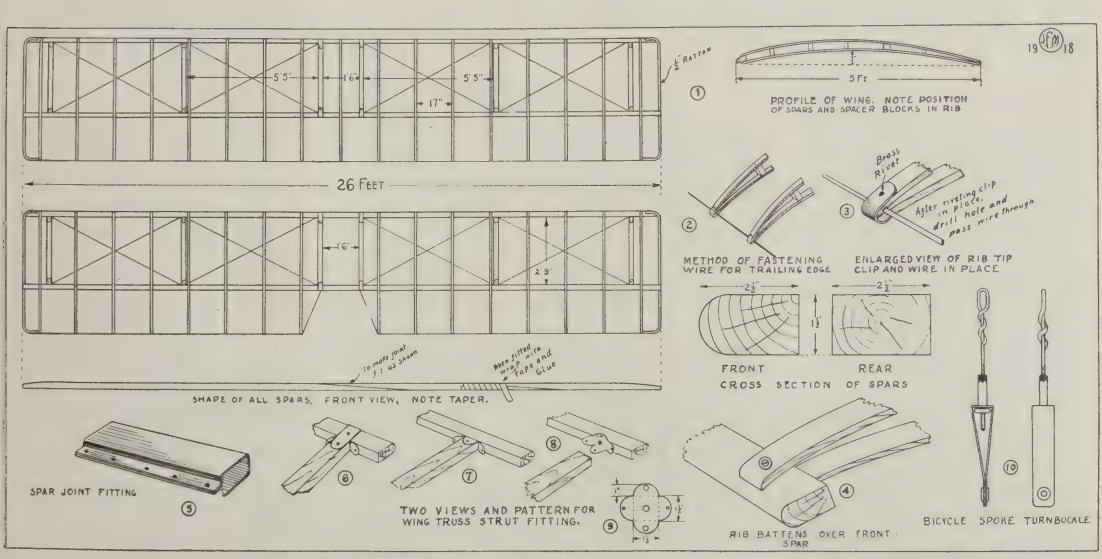
We will take up the operation of a glider fully in a later article.

The glider is made up mainly of spruce of different sizes and thicknesses, which can be purchased cut to the desired sizes at any lumber yard. Of course the finishing work can be easily done by the builder. I don't think it necessary to warn the reader to be more careful when constructing or assembling the different parts, then when building the small models, because we know that this machine is to carry the operator and must be made strong, as well as light as possible. The glider should not weigh more than eighty pounds.

The construction of the wings are somewhat similar to our double surfaced model wings. The main spars are made of spruce 2½" x 1½" and 25 feet 11 inches long. It will not be possible to get a piece of lumber of this length without knots or flaws, so it is necessary to piece it and wrap the joints as shown in the front view of the spar shown below the wings. If the builder is fortunate enough to secure lumber 13 feet long the glider can be made in two halves oarting the middle and joined by a fitting made of heavy gauge sheet iron as shown at the left of the cut.

If this method is employed, the center rib in the wing must be omitted and this part will remain uncovered when the glider is finished. Cross section of the front and rear spars are shown in figures to the right of the wings.

The ribs are made of two strips of spruce ½" x 3/16" and 5 feet 1½" square are glued and nailed between the ribs to hold the strips in shape and to reinforce them.



All ribs should be made before fastening to the spars. When making the ribs, a piece of lumber 2" thick should be cut to the shape of the bottom strip. This is done by drawing a line horizontally and then measuring a distance of 3" from this line. A curve should then be made starting and ending at each end of the line and reaching the height of 3". The lumber is then sawed along this curve, which leaves a mould to work on.

To make the ribs, lay one strip of wood on the mould with the convex side, nail and glue the blocks in place, then lay this part of the rib on the concave side and nail the other strip to the blocks. When all ribs are made, slide them on the rear spar to the proper places and fasten in place. The front spar is then fastened to the front edges of the ribs.

To strengthen the wing it must be reinforced by a sort of bridge truss arrangement. It is then necessary to put struts 1½" square between the spars to take the compression when the wires are tightened. The method of fastening the struts and a pattern for the strut fastening is shown in Figures 7, 8 and 9. The plate is fastened to the spars first, by a 1" wood screw, the top and bottom tongues are then bent out and the strut fastened in place by a 3/16" bolt. The other two tongues are left for fastening the truss wires in place. The truss wire is 16 gauge piano wire. (The strut shown in Fig. 6, is reinforced by another strap around the spars and fastened to the strut. This is done to the four struts in the center of the machine, because these members must take the full weight of the operator in flight.)

To tighten the wires, it is necessary to have some kind of an arrangement to take up the slack. This can be done by making turnbuckles from ordinary bicycle spokes and a strip of 16 gauge sheet metal. The turnbuckle is made as shown in Figure 10. When trussed properly the ends can be put in place. These are made of ⅛" round ratton fastened to the front spar, bent to a convenient curve, fastened to the rear spar and then fastened to the end rib after bending at right angles. When this is finished the trailing edge is fastened in place. This consists of piano wire running through each rib at the rear tip as shown in Figures 2 and 3.

(To be Continued)

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

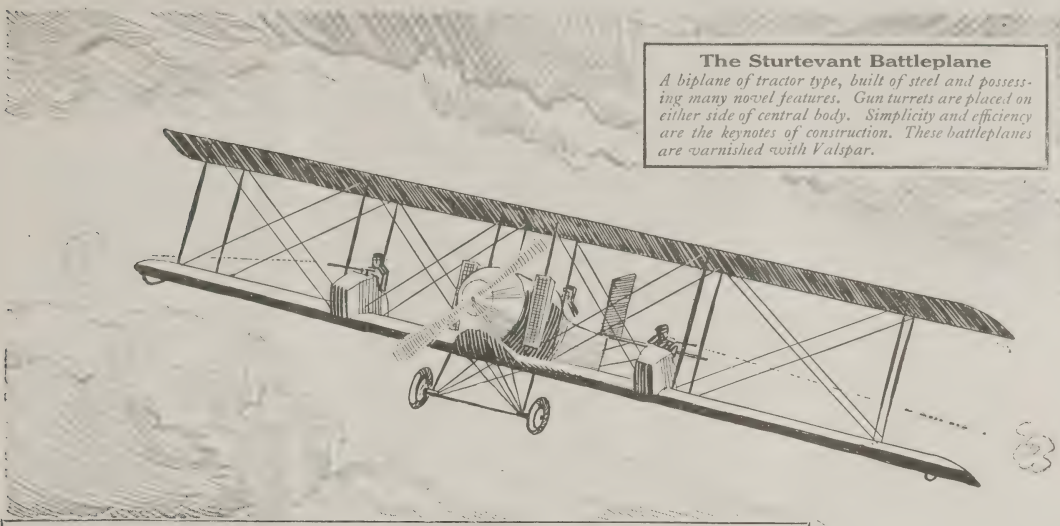
Intelligent Female (to balloon officer of observation sausage): I wonder you don't have a ladder or a fire escape or something of that sort, instead of just having that rope to climb up and down."

Aerodrome Proverbs

It's the last bump that breaks the chassis strut.
A switch off in time saves nine days in the repair shop.

Absent without Leave

Mess President: "Cook that dinner today on the new gasoline stove, Johnson."
Johnson: "Well, sir, I begun to, but it went out."
M. P.: Well, light it again."
Johnson: "Yes, sir, but it's not back yet. It went out through the roof."



And, yea, it
Hath been said
By them of
Frequent times
That forgiveness,
Like garters,
Loose their snap
When they are
Stretched
Too far.
A mother-in-law's
Womanly dignity
Is a thing for
Angels and
Cadets to titter

A night of
It with some of the
Birds and other
Fowls.
* * *
When I got home the
Top Cutter-me
Mother-in-law gave
Me almighty hell
On three charges:
Missing evening
Retreat, being out
In town without
Pass and not
Answering "Heah"
At inspection.
She talked putty
Rough and gave
Me fo' days provost
& confined to
Quarters for a like
Period.
* * *
As reveille blew
I woke up in
A sweat—'twas only
A dream and
The Ramblings of an
Idle Brain, as
Sayeth the Poets
& Poetesses.
Thank Hannah! I was
In my upper bunk
In peaceful ol'
France with
Only the noise of
The cannon and
Other aviation field
Equipment to
Annoy me!

—*Exchange*

The Sturtevant Battleplane
A biplane of tractor type, built of steel and possessing many novel features. Gun turrets are placed on either side of central body. Simplicity and efficiency are the keynotes of construction. These battleplanes are varnished with Valspar.

Valspar protects battleplanes—

For many years Valspar has been the most famous varnish for yachts, ships and boats of all kinds.

Its tough elasticity, its resistance to water, sun, atmospheric and climatic changes, have been amply proved by these years of actual every-day testing in all weathers.

More recently it has been demonstrating these qualities in the still more strenuous air-service of the Allied governments. Today it is unquestionably the standard varnish for both airplanes and seaplanes. Its supremacy is definitely established in both arms of the service.

Because Valspar is a long-oil varnish, of exceptional durability and waterproofness, it protects wood, metal or fabric without checking, cracking, blistering or turning white. It is absolutely reliable under the most exacting conditions, where ordinary varnish would fail entirely.

To purchasing agents and superintendents of production, we will gladly send a copy of our new book, full of valuable information on airplane finishing. Our Airplane Department is also ready to afford any desired information or assistance on request.

VALENTINE & COMPANY, 456 Fourth Avenue, N. Y.

Largest Manufacturers of High-grade Varnishes in the World—ESTABLISHED 1832

New York Chicago Boston Trade VALENTINE'S VARNISHES Mark Toronto London Amsterdam

33 WEST 42d STREET NEW YORK, N. Y.

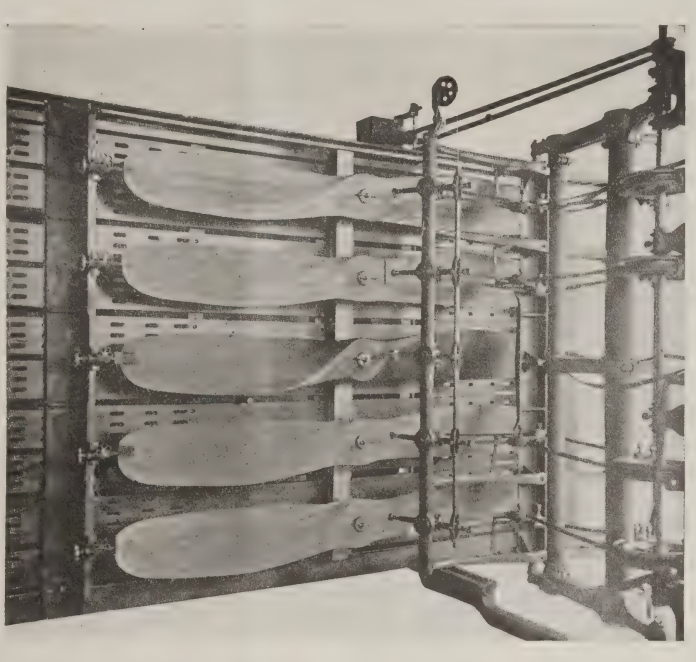
WE SPECIALIZE

3 ply, 5 ply, 9 ply and 15 ply, birch, mahogany, walnut and red gum waterproof veneers. Our products have officially passed Government test of boiling of twenty-four hours and baking twenty-four hours. Capacity 30,000 square feet daily. In an official Government report on sample three and five ply panels submitted by us for test, it was stated—

> **"Boiling tests and salt water soaking tests as follows were made on each specimen: Specimens were boiled for 8 hours, then baked for 24 hours at 100 deg. C.; specimens were soaked in salt water (4% salt by weight) at room temperature for 24 hours and then baked for 24 hours at 100 deg. C.**
>
> **"Results:—The glue held firmly in all tests. Neither the boiling nor the salt water soaking tests caused any indications of separations of the plies of the veneers tested."**
>
> **Dated, March 30th, 1918.**

Laminated wing beams of spruce. We have under contract a supply of aeroplane spruce and could undertake to manufacture 50 sets of 8 wing-beams daily. In an official Government report on a sample wing-beam section submitted by us for test, it was stated —

> **"Conclusion:—These beams carried a much greater transverse load than solid wood beams of the same material and section. The glue joints between web and flanges are stronger in shear than the web section, and the glue had fairly good waterproof qualities. These beams show the superiority of the laminated construction over the solid construction as to strength and great saving in material."**
>
> **Dated, March 11th, 1918.**



We offer single ply birch, maple, walnut, mahogany and red gum in sizes cut to order.

SHIPPER IN CAR LOTS OF

Spruce, Ash, Oak, Birch, Cherry and other manufactured aeroplane lumber.

IMPORTER OF CLAUDEL CARBURETORS

The Curtis Dreadnaught Propeller Cutting Machine, Model 55

THIS machine cuts four blades at a time, and cuts closer and more accurate than any other machine in the market.

It finishes the hub the same as all other parts of the blade.

It cuts with the grain of the wood.

It does not require a metal model; just a regular stock blade is sufficient.

It does not bump over the pattern.

It is manually operated, which gives it the advantage of the human touch required on accurate work.

The hand work required after this machine is from 3½ to 4½ hours on each blade.

It leaves just enough wood for cleaning up.

Curtis Machine Corp.
Jamestown, N. Y.

Cylinder Grinding Machine

For grinding Aeroplane and Automobile Engine Cylinders, as well as other kinds of internal grinding.

Grinds holes from 3 in. up to 7 in. in diameter and 14 in. deep.

Can be equipped with wet-grinding attachment if desired.

This machine was formerly made by Brown & Sharpe Mfg. Company.

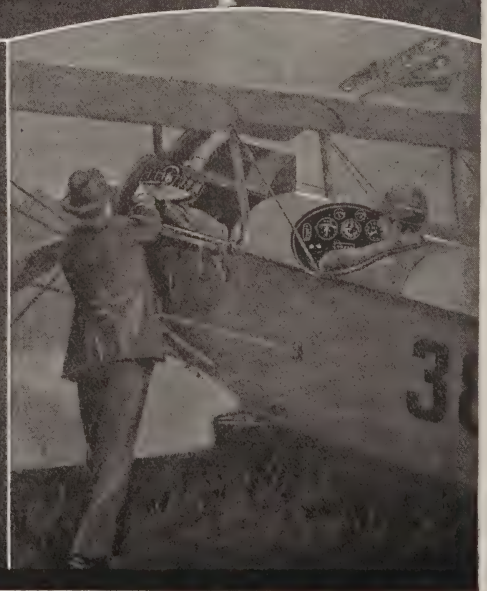
WE USE THE CELEBRATED

LUMA

Radium Luminous Compound



Luminous Dials

Prompt service, highest character of workmanship and uniformly satisfactory results are some of the advantages enjoyed by manufacturers of æronautic instruments who send us their dials to be Luma-lited.

We use Luma exclusively because we believe it to be the world's best luminous material. Luma contains only Radium as its activating agent, no Mesothorium, Radiothorium, Ionium nor Polonium being added.

Our several dial painting factories are fully equipped to handle successfully orders of any size.

Write for estimate and full information.

BOSCH

AMERICA'S SUPREME IGNITION SYSTEM

NOTHING that can be said or printed is half as forceful evidence as to the superiority of Bosch Magneto ignition, as is their actual accomplishments during the past half score years.

In aeronautics especially, their remarkable efficiency has always been accompanied by remarkable reliability.

From basic design down to matters of mere detail, Bosch design and manufacture fully measure up to the exacting requirements of aeronautical needs.

Engineers aiming to follow the approved practice of successful, world famed designers, are offered, without obligation, the assistance that Bosch experience offers thru Bosch resident engineers.

(*Continued from page* 164)

and who is now in Paris, has volunteered to pay the expenses of establishing and maintaining a club in Paris for the Allied aviators during the period of the war, in the name of the Aero Club of America.

Mr. Beaumont was a resident of New York, before going to Paris in connection with Red Cross work. He is sixty-one years of age and a native of Dayton, Ohio.

Major Edmund Gros of the U. S. Air Service, who was one of the three founders of the Lafayette Flying Corps, and is a member of the Foreign Service Committee of the Aero Club of America, recently wrote to the Aero Club recommending the establishing of homes for tired aviators. His recommendation read, in part, as follows:

There is in my estimation, no way in which the Aero Club of America could render greater service to American aviators, and incidentally to the American Army, than by establishing one or more homes, where tired aviators could rest and find amusement and comfort.

The strain which active service brings to bear on the nervous system of a flying man is so great that few resist for very long without showing signs of breaking down.

The pilot himself feels this fatigue coming on, but as a rule will not give in until his symptoms become very marked. For instance in a case recently brought to my notice, one young fellow who had just been through several offensives, cried in a grocery store because the grocer told him he had no more sugar.

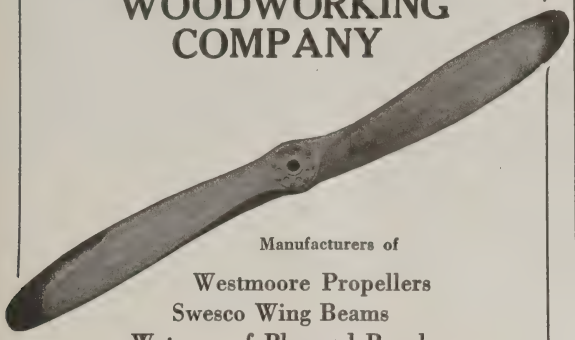
Examples are common where a pilot has been allowed to get in a state of extreme nerve exhaustion before leave was granted him.

It strikes me therefore, that there is a wonderful opportunity for the Aero Club to do good work, in a line which is not followed by other organizations.

Broken down pilots are first sent to a hospital where they are surrounded by illness and suffering. After this they are given a convalescent leave, and allowed to chose their place of rest. It is here that the difficulty begins. If they go to some country place, as likely as not, the food will be bad, the hotel expensive, and unless they meet friends, they will be bored.

If there was a home, run by fine broad-minded women, where there would be considerable liberty, gaiety and enjoyment, the aviator would quickly recover his morale and nervous equilibrium.

To obtain this, the life which he would lead here should be with considerable freedom of movement, Dances, Tennis, Swimming, etc., in a word, an active, home life.



In the case of the aviator whom I mentioned above, I sent him to a small watering place on the West coast of France, where I knew there were young people full of fun and ready to have a good time.

This Aero Club aviator's home would be destined for a special class of men, those who after strenuous work at the front have manifested unmistakable signs of nervous breakdown, whose efficiency is momentarily lost, and who, to be restored to usefulness, require a certain kind of moral nursing.

In accomplishing this task, one would not only be doing a humane thing to the finest specimens of our manhood, but would also contribute directly to the fighting force of our army by quickly returning to a state of efficiency, men who are momentarily useless as combatants.

This recommendation received the unanimous approval of the Foreign Service Committee, the membership of which includes; Ambassador, Wm. G. Sharp, Honorary Chairman; L. G. Bennett, President of the American Chamber of Commerce in Paris; Chairman; Sidney B. Veit, Honorary Secretary; John Weare, Treasurer; Robert W. Bliss; Wm. S. Hogan; Dr. A. L. Hipwell; Major E. L. Gros; Major Wm. Thaw; and G. F. Campbell-Wood and the Aero Club of American acted on their approval.

engine with a new cylinder head (figs. 7 and 8), and also with new cams, including a camshaft reduction of 1:3. In the head is mounted a new transfer valve similar to the suction valve, which establishes the communication between the cylinder and the receiver. In order to avoid excessive valve spring tensions, the valve is provided with a balancing piston (fig. 9) on which acts the pressure of the receiver. The transfer valve is actuated by a com (fig. 10) through a bell crank. Unfortunately, the position of the transfer valve on the opposite side of the camshaft necessitated an extraordinarily long and therefore heavy operating lever, the result being unfavorable inertia forces. The cam has two projections—the one opens the valve to transfer the air into the receiver, and the other to transfer it back into the cylinder. The double opening is also necessary with the suction valve, and accordingly this cam (fig. 11) has also two projections.

Fig. 12 shows a better solution of the problem. Suction and transfer valves are combined. The connection between the receiver and the outside air is governed by a concentric sleeve valve fitted above the mushroom valve in the cylinder head. This sleeve valve has only to assure air tightness against the receiver pressure (about 1.5 atm.) The mushroom valve is opened once only and remains open during the first four strokes. The sleeve valve establishes communication of the cylinder with the outside air and the receiver alternately. This design is in course of construction, and it is proposed to repeat the tests when completed.

During the tests the engine was coupled with a dynamo (figs. 13 and 14), the efficiency of which was previously determined accurately.

In all 100 tests have been carried out with different oils, at different loads, compressions, and different needle valves, while during small intervals (five to eight minutes) indicator diagrams (figs. 15 to 18) were taken with strong and weak springs. In order to determine the heat carried away by the cooling water, the amount of water and its temperatures at the inlet and outlet was measured.

The heat carried away by the exhaust gases was also measured. This was effected with a water-cooled silencer and calorimeter illustrated in figs. 19 and 20. The amount of water had been weighed separately, and the temperatures of the water registered at the inlet and outlet. The flow of water to the calorimeter was so regulated that the exhaust gases reached approximately the surrounding temperature.

Table II. gives the results of one series of the tests. During this particular series Galician crude petroleum was employed, the higher calorific value of which was 10,395 and the lower calorific value was 9,795 Th.U./kg. The consumption figures have been converted to the mean calorific value of 10,000 Th.U./kg.

The consumption was good at all loads. With such an overload as to bring the total output to about 47 h.p. the exhaust became somewhat impure. The load could be brought up to 53 h.p., however, with a smoking exhaust. This load can therefore be considered only permissible temporarily.

The simple plate diffuser was not adequately dimensioned to cope with the double amount of oil necessary for each charge. Experience in this direction was lacking to obviate the defect, and for this reason the fuel consumption was adversely affected. There is, however, no reason why the combustion could not be effected just as completely as in the four or two-stroke cycle engine.

In the heat balance the upper calorific value has to be taken, because the exhaust gases are cooled down to almost the surrounding temperatures, and it will be seen that the sum of the measured heat quantities (indicated power plus exhaust gas plus cooling water heat) is smaller than the calorific value of the oil consumed.

Uncle Sam, We Are Here!

WHEN Uncle Sam finally saw the importance of striking Germany through the air, in the Summer of 1917, and he wanted to place orders for about 25,000 aeroplanes, 40,000 motors, and the necessary equipment to build a real Air Service, he looked around and found a very meager aeronautic industry—meager because there had never been enough business on which to develop.

Then Uncle Sam called on the other industries for help and their answer was like General Pershing's answer when he landed in France. General Pershing said: "Lafayette, we are coming." The industries said: "Uncle Sam, we are coming."

On July 14th, 1918, General Pershing went to Lafayette's grave and said simply "Lafayette, we are here!" Only four words, but much more eloquent than a book.

Now that American battleplanes equipped with Liberty and Hispano Suiza Engines are actually helping the Allies' Advance, and, as the War Department announces, 6,600 training planes and 12,500 training engines have been produced, the Aeronautic Industry can say: "Uncle Sam, we are here!"

Believing that there is no better way of carrying this idea "across" than to paraphrase General Pershing's statements, as above, AERIAL AGE will issue a special number on October 21st, to be called the **"Uncle Sam, we are here"** Number.

In this number we will give a review of the status of the Aeronautic Industry and of the splendid outlook for quantity production. This number carries out the policy of President Wilson to do everything possible to cheer up our Allies and cast gloom in Germany, by showing that Uncle Sam is in this fight to win and that he is getting into a state of production and will soon be in a position to strike with both fists as well as with both feet.

Your firm is one of those who can say: "Uncle Sam, we are here."

Put the punch behind your advertising copy, and have it in our hands not later than October 15th, and we will do the rest.

VOL. VIII NEW YORK, OCTOBER 14, 1918 NO. 5

IS GERMANY'S DEMAND FOR PEACE A TRICK TO DEFEAT THE FOURTH LIBERTY LOAN AND CAUSE U. S. TO STOP SENDING SOLDIERS OVERSEAS?

THIS is the question we must ask ourselves—and we must not relax an instant from the work of producing war materials.

Let there be no pause in the production of aircraft. To-day's (October 6) despatches in telling of the attacks of German aviators on American troops on the Argonne front say:

"Our pursuit squadron tonight sought out the foe beyond the Kriemhild line and over our own lines as well, but still his airmen, singly and in groups, skimmed above our troops, sometimes at a recklessly low altitude."

We are dealing with a deceitful, resourceful enemy, let us beware.

Germany felt certain that our tonnage would never permit our sending overseas half a million men and she was not afraid of that number. She felt certain that we could not convoy our ships and that the output of aircraft, submarines, and artillery would be negligible. It did not occur to Germany that England would be in a position to transport one million Americans to France and to do seven-tenths of the convoying of troopships, protecting them against U-boat attacks.

If Germany could defeat the Fourth Liberty Loan and stop or retard the sending over of more soldiers and equipment or cause the United States to pause in its work of producing war material, she could then prepare throughout the winter months, so as to be ready next spring for a new offensive.

But the nation with one voice has answered the Germans as they should be answered and as President Wilson answered Austria recently.

Following are quotations from the leading newspapers throughout the country:

NEW YORK

No Peace with the Hohenzollern

From the New York *Times*

If Germany wants peace, let her do away with her irresponsible, braggart Kaiser and speak by a Government of her own people to the Governments of the allied peoples. It is not from Prince Maximilian, answerable only to imperial authority, but from a minister responsible to the German people that Germany's plea for peace must come.

President Wilson can be trusted to make an answer to these overtures which will leave no doubt as to the determination of Germany's foes to pursue their victories until she can fight no more, until surrender is forced upon her, and with it security against any further disturbances of the peace from that quarter.

"Autocracy Knows It Is Whipped"

From the New York *World*

It has taken the Imperial German Government more than four years to learn that it is easier to begin a war than to end it. When it staged the conflict such a thing as defeat was not considered. Now it finds its armies overmastered, its subjects at home sullen or revolutionary, its allies beaten or disheartened, and the vast delusion that it could not be conquered everlastingly shattered. To save what it can from the wreck, to preserve the dynasty, to restore as far as possible the lost prestige of militarism and to prepare for another day—what further motive can have inspired it and its Austrian vassal in renewing so soon and in phrases so little changed a proposal for a negotiated peace?

The answer to this question, we believe, is that autocracy is whipped and knows it is whipped, and that presently it will be compelled to acknowledge the fact.

Still "Force to the Utmost"

From the New York *Tribune*

They address their overtures to us, pretending to accept in principle the conditions of peace laid down by President Wilson. But they are wrong. We are not the peace makers. We are the war makers. It is true that we have laid down certain abstract conditions of peace, but these concern only our allies and ourselves exclusively, and are not open to Germany for discussion.

We have laid down one condition of war—one only—and that is to use force, force to the utmost, force without stint or limit, until we shall have destroyed forever in this world the indecent, intolerable, criminal thing that now holds out its dripping hand.

Acknowledgment of Defeat

From the New York *Herald*

It is Foch and Pershing and Haig and Diaz and d'Esperey and the valiant men of their commands, and the people back home who are giving them such splendid support, who are making for peace—the right sort of peace—but unconsciously Prince Maximilian and Baron Burian may be helping. The Hun is cracking. In these desperate appeals for peace will not the men at the front see an acknowledgment of defeat by the Governments upon which they have pinned their faith and whose word they have accepted with blind faith in their omnipotence? . . .

There will be no armistice. There will be no negotiations until Germany prefaces its plea with unconditional surrender. We have just begun to fight!

ALBANY, N. Y.

"Strikes Us as Only Funny"

From the *Knickerbocker Press*

Talk of peace from the Kaiser is momentous news. But except as news it is of no importance. We do not want to talk to the Kaiser. From him we want one thing first, unconditional surrender, and what happens afterward we will decide for ourselves. The Kaiser will not be there. His futile scurrying around to save his skin strikes us as only funny. Let him give up his arms and his armies and get back into Germany where he belongs, joining restitution to penitence, and guaranteeing both by a humility that cannot be questioned, and thereafter there may be a peace conference, but it will not be one with a German present.

BOSTON
Beware of Empty Talk
From *The Herald*

The Austro-German proposals for an armistice can have no success. An armistice would be of great military advantage to Germany, Austria-Hungary, and Turkey, enabling them to rest and reorganize their armies and construct new means of offense and defense. Not for one day, not for one hour, nor for one instant should continued occupation of the invaded territories be permitted by the Powers, whose very first purpose is to free them from the invaders. Then let us beware of calling a halt to listen to empty talk which is intended to flatter and dupe. The proper course was taken with Bulgaria. Unconditional surrender is the door to real peace negotiations.

Question of Germany's Fitness
From the Boston *Globe*

Revelations may occur overnight. Revolutions do not. And it will take more than Prince Maximilian's belief that Germany is now fit for decent nations to associate with, or to do anything but war against, to make her so. For it is not the kind of peace we make with Germany that matters so much as the kind of Germany with which we make peace.

Merely Ask for Armistice
From the Boston *Post*

It is impossible to regard this plea for an armistice as anything but a species of trickery either to gain military time, with armies hard pressed by the master genius, or to get around a peace table holding the better cards for the game. In fact, they do not ask for peace; they do not sue; they merely ask for a cessation of hostilities in order "to start without delay negotiations for peace"—and the world knows what such a proceeding would mean to the unscrupulous scoundrels who would, as things are today, speak for Germany in such a council. Armistice? A thousand times no.

BUFFALO
Must Be No Armistice
From the Buffalo *Express*

The *Express* regards the proposal as a "Kamerad" cry and thinks it evidence that the German army is beaten on the present front. There must be no armistice during which Germany could extricate her army and reorganize it on the short front of the German border, thereby prolonging the war two or three years. . . . If they want peace, let them seek it in the manner that Bulgaria did.

Same Deceptive Game
From the Buffalo *Courier*

The latest output of peace talk from Berlin is merely a part of the same deceptive game, under the guise of a new Chancellor with a curiosity-exciting advertisement of a new policy of moderation and concession, a policy of come into the spider's parlor and talk it over. No, the people of the United States have their eyes fixed steadfastly upon the battlefields, where they expect to see the winning of the victory that will enable the winners to dictate the terms of peace. Smash on, smash on!

PROVIDENCE, R. I.
Enemy Is Facing Justice
From the Providence *Journal*

It seems incredible that Germany should believe that her mouthings about the rights of nations are going to bring the Allies to kiss her bloodstained hands at the moment when she is facing the justice which comes sooner or later to those who violate the laws of God and man.

PHILADELPHIA
German Perfidy Known
From the Philadelphia *Public Ledger*

There is no occasion for the Allies to answer in detail the peace offer of the new German Chancellor. The Kaiser himself has answered it. His proclamation to the army and navy is in the old arrogant vein. "The Macedonian front has crumbled. Our front has not been broken and it will not be." The retreat in Belgium and France leaves him still boastful and unrepentant. If he foresees the end he will not admit it. He is still to dictate conditions. "It will be only an honorable peace for which we extend our hand." What is honor to him and his Government? We have learned from bitter experience the perfidy of both.

Why Negotiate?
From the Philadelphia *Record*

If the Central Powers are ready to stop fighting, let them stop and ask the Allies for terms. If they are not yet ready for that, they had better keep still and go on with their fighting. . . . Why should the Allies negotiate with them? They have plenty of men and plenty of money and munitions to carry on until the Central Powers make an unconditional surrender.

PITTSBURGH
Russia's Fate a Warning
From the Pittsburgh *Dispatch*

The German high command showed in its dealings with Russia that it has no more respect for an armistice than for a treaty. It cannot be trusted either in peace or war. Therefore, no armistice until the Germans are back in Germany. Prince Maximilian's peace offer is the same old trick in a new guise. Anything for an armistice that will save the German military situation and for negotiation that will befog the issue.

CLEVELAND
Utter Surrender Only
From the Cleveland *Plain Dealer*

There is but one possible termination to the war. The fighters will never pause until Potsdam is beaten down into the dust, until the Germany that seeks terms is a non-Potsdam Germany. Germany can have the peace that has come to Bulgaria. She can have the peace of utter surrender, the peace that is based on safe assurance of future decency. Other peace for Germany there can never be.

DETROIT
Example Set by Bulgaria
From the Detroit *Free Press*

The utterances of the President of the United States and of the Entente statesmen give us guarantee that the position taken toward Bulgaria when the Sofia Government asked for an armistice provides a forecast of the position the Entente will take toward Bulgaria's erstwhile ally and master. Don't relax. Don't quit until President Wilson announces that victory is ours.

TROY, N. Y.
No Dealings with Hohenzollerns
From the Troy *Record*

The Hohenzollern Noah has sent another dove from the ark with an olive branch in its mouth. It is a pretty ritual and can do no harm to the cause of freedom. For the Allies will have no dealings with the Hohenzollerns on Prince Max's terms or any others. When Germany itself offers unconditional surrender, talk of an armistice will be tolerable.

ST. LOUIS
Peace Talk Useless Now
From the *Globe-Democrat*

It is useless for the Central Powers to talk of peace when their talons clutch the land which they have grasped and while they hold the people of the countries they have overrun in enslavement. Ending the war is a mere incident in the achievement of the great purpose which has become the fundamental issue of the struggle.

Must Follow Bulgaria's Example
From the *Republic*

Austria has already been told that before its invitation to a peace conference is accepted the conditions already laid down by the Allies must be agreed to, not merely as a basis of discussion, but a basis of agrement. Austria can have an armistice if she agrees to terms similar to those agreed to by Bulgaria.

LOUISVILLE, KY.
America Has But One Answer
From the Louisville *Courier-Journal*

Whether the time for the peace conference is now or later, whether the reports are part of the giant propaganda styled "The Kaiser's Peace Drive," or whether they are the result of the downfall of the military colossus of Europe, the people of America have but one answer: Unconditional surrender. Military autocracy and its ambitions must be felled forever. The long line of allied fighting men from the North Sea to Colmar, moving in a trail of priceless blood toward the Rhine, will not find their home nations making terms behind them.

SAVANNAH, GA.
Must Lay Down Their Arms
From the Savannah *Morning News*

It seems to the *Morning News* that the answer of the President of the United States to this "offer" of peace should be that the United States cannot treat with the Kaiser. The German armies must lay down their arms before peace talk begins. The democratic world has the chance now to rid itself of Hohenzollernism. If this generation does not seize this opportunity it will deserve the condemnation of posterity. Let there be no "next war." Let's finish the business this time.

(*Continued on page* 235)

THE NEWS OF THE WEEK

To Berlin Via Airline

(*Written exclusively for* AERIAL AGE WEEKLY.)

The aeroplane typifies this war just as the phalanx typified the wars of Alexander the Great. This war has become a war in the air. Both sides are fighting for the supremacy of the skies, and America intends to help win it for the Allies. For that reason the United States is building thousands of aeroplanes. More than we possess will be needed to carry the war into Germany.

It takes vast sums of money to build aeroplanes in quantities sufficient to make sure of the sky battle. It also takes money for ships to combat the menace of the submarine—and money for our guns and all that land warfare necessitates in order to crush German militarism.

This money the United States *Government proposes to raise* by the Fourth Liberty Loan Campaign for *six billions of dollars*. The success of the campaign rests on the understanding of the people that this money is to be devoted solely to the nations' solemn purpose of liberating the world from the threat of German militarism.

The war has taken the aeroplane out of the experimental stage and made it a practical instrument of warfare and a useful means of transportation in times of peace.

We must have a never-ending procession of aeroplanes, an aerial Brooklyn Bridge, from America to Berlin. There must be aeroplanes tearing across the sky, winging their way over the sea into Germany, with Berlin as their journey's end.

So lend the Government your money—with Liberty Bonds as your security with interest—that sufficient quantities of aeroplanes may be built to crush Teuton vandalism and liberate the world from the threat of German militarism.

Flew from Aberdeen, Md., to New York

Lieut. E. M. Ronne, U. S. A. S., and Lieut. C. H. Roberts, U. S. A. S., recently flew from the Aberdeen proving grounds, Maryland, to New York City, a distance of about 185 miles, in two hours and fifteen minutes. On October fourth Lieut. Roberts and Ensign Davis, U. S. N., flew back to Aberdeen.

Need Mechanics for Air Service

Trade Test Board No. 2 has sent out the following statement: "The Government is now calling for skilled mechanics between the ages of eighteen and forty-six in the following trades. Motor mechanics, instrument repairers, coppersmiths, carpenters, ignition repair men, propeller makers, blacksmiths, cabinet makers, fabric workers. Mechanics wishing to answer the call and enter the United States air service may apply to Lieut. Billker, ninth floor of 104 Broad Street, any day except Sunday, between the hours of 8:30 in the morning and 5 o'clock in the afternoon."

Kaiser Hid in Cellar During Mannheim Raid

Geneva.—Emperor William, Field Marshal Duke Albrecht of Wurttemberg, and Prince Stephen of Schaumburg-Lippe were in Mannheim when British airmen raided the city.

The royal party, according to the *Democrate* of Geneva, was staying in the Royal Palace and the Emperor and his staff promptly took refuge in the cellar, remaining there twenty minutes. The palace was not hit, as it had been in a previous raid, but bombs fell in the vicinity.

France Honors U. S. Airman

Paris.—Lieut. W. Vernon Booth, Jr., of the American Flying Corps, was cited in the *Journal Officiel* on September 29 as a pilot of splendid courage. The citation says:

Seriously wounded during a fight with four enemy planes and his own plane on fire, he had the presence of mind, despite severe burns, to extinguish the fire and land between the lines, forty yards from the enemy trenches. He regained the French line through a heavy gun and machine gun fire.

Lieut. Booth died in a Scottish hospital near the fighting front early in July from injuries sustained in an aerial combat over the German lines. The injuries necessitated the amputation of a leg. In Paris last April, Lieut. Booth married Miss Ethel Forgan, daughter of a Chicago financier.

Benefit for Air Corps

White Sulphur Springs, W. Va.—Seven hundred dollars was raised on September 28 for the athletic and musical equipment fund of the National Aeronautic Committee, when official films were shown by Augustus Post, secretary of the Aero Club of America. Lieut. Reid Benham gave a short address. Mrs. Edward W. McKenna, chairman of the entertainment committee for the association, was in charge, assisted by Ethel Barrymore, Miss Josephine H. McClure, Mrs. David Stevenson and Mrs. J. Howard Slocum.

LIEUTENANT FRANK LUKE, JR., DESTROYS THREE GERMAN BALLOONS IN THIRTY-FIVE MINUTES

The photo shows Lieutenant F. Luke, Jr., who at dusk on the 17th of last month brought down three enemy balloons in the surprisingly short time of thirty-five minutes. Luke comes from Phoenix, Ariz., and he has done some wonderful work as a "bird man". These additional three bring his total for three days up to eleven. Eleven enemy balloons in three days! Lieutenant Luke has decidedly brought honor to his native city by his accomplishment in his air fighting on the Lorraine front

Germany Drops Its Plan to Punish Our Aviators

With the American Army in France.—A captured document says that the German decision regarding the courtmartialing of American aviators caught dropping propaganda pamphlets has been rescinded and that in the future only aviators having propaganda in their possession will be dealt with as "special cases."

Lieut. Luke "Hates" Balloons

Lieut. F. Luke, of Phoenix, Ariz., fattened his record of enemy balloon destruction by shooting down two additional balloons, making a total of eleven in four days. In addition he brought down two aeroplanes in that period.

One of the Lieutenant's victories over an enemy plane was confirmed by himself. He landed by the side of the fallen machine to make sure that its occupants did not escape and turned them over to the French. He then returned to his squadron with the confirmation papers in his pocket.

All of the eleven balloons were accounted for by means of incendiary bullets. The majority of the attacks on the balloons were made at the greatest personal risk to the flier because he was the objective of quantities of the type of anti-aircraft projectiles called "flaming onions," which set an aeroplane ablaze if they hit it accurately and which must be nimbly dodged in the air.

On the flight during which Lieut. Luke brought down three enemy balloons and an aeroplane, his gasoline became exhausted and he was forced to depend upon the small emergency tank. Lieut. Luke turned on this supply, sufficient only for ten minutes, and though on the German side of the lines he went after his two opponents in Fokker machines.

Hughes Resumes Hearings

Washington.—Hearings in the Department of Justice aeroplane investigation have been resumed after a recess of several weeks devoted to transcribing records of testimony.

Army officials, civil officials and representatives of aeroplane manufacturing concerns are to be heard here by Charles E. Hughes and Attorney General Gregory, and these officials expect to begin next week the task of compiling the final report. This probably will be completed and sent to President Wilson in about three weeks.

Prince Demands War Role

London.—The Prince of Wales has figured in many stories which concern his insistence on having a real part in the war, regardless of the danger to himself.

The Prince recently appeared on the Italian front and explained to the commanding officer of a British flying squadron that he had obtained permission from his father to accompany one of the fighting pilots over the Austrian lines.

One of the crack British airmen was just leaving on a strafing mission and reluctantly yielded to orders for the Prince to accompany him. The machine flew very low, using machine guns on the Austrians, to the great satisfaction of the Prince.

Must Fly in Planes They Declare O. K.

Washington.—Government inspectors of aeroplanes and engines who pronounce machines safe and ready for flight will be required henceforth to accompany the pilot on the initial test in the air. Likewise mechanics repairing aircraft will accompany pilots on first flights after the work is pronounced done. The idea, according to W. C. Potter, acting director of aircraft production, is to give the inspectors and mechanics "a proper appreciation of their responsibility."

"I know no better way of impressing upon these men the importance of their work," said Mr. Potter, "than by giving them a first hand demonstration of the very great stresses and strains put upon aeroplanes and engines."

D'Annunzio in New Flight

Rome.—Gabriele d'Annunzio, the Italian author-aviator, who on September 26 flew from Turin to Chalons, behind the French front, a distance of about 290 miles, made a return flight from the French front to Milan in three hours and ten minutes.

Aeroplane's Last Tribute

Hempstead, L. I.—While thirty-six aeroplanes hovered overhead dropping flowers, the body of Major Whitten J. East, commander of Mitchel Aviation Field, who was killed on October 2 in an automobile accident near Hazelhurst Field, was taken to the railroad station for transportation to the home of his parents in Sanatobia, Miss. A military escort went with the body. Just before the flyers took to the air, Major East's machine, "The Fighting Cock," was wheeled out to the starting line on Mitchel Field. It was draped in black and there was a wreath of roses on the propeller. One by one the "ships" ascended until "The Fighting Cock" stood alone on the wide field.

Downed 4 Times, U. S. Flyer Kept On

Shot down four times in a day, an American aviator named Allen, from California, landed safely each time and ended his day's work by capturing a squad of Germans single handed during the advance in the St. Mihiel salient.

Lieut. Robert Burton, of the Royal Flying Corps, is the authority for the story.

Lieut. Burton, himself a flyer, took part in the drive. He was shot down and is now on his way to his home in Manitoba with a broken leg.

"Some of your American aviators," he said, "flew for thirty-six hours, only descending for gasoline and bombs and ammunition, and they have demonstrated themselves as being in the top rank of the aviators of the world."

U. S. Flyers Down 33 Enemy Planes

With the American Army Northwest of Verdun—American aviators again demonstrated on September 28 that they are the masters of the air on this sector. They engaged in 52 combats and brought down 33 enemy machines without the loss of one American pilot.

The German airmen appear to have lost the daring which had characterized their work of the previous days, and did not venture across the American line with reconnoissance aeroplanes after they had been attacked once by the American machines. The German balloons were hastily lowered in the face of an American attack and did not appear again during the day.

One of the American pursuit groups engaged in 23 combats at low altitudes and brought down three enemy machines. Another pursuit wing had 17 battles in two sorties along the line. A third group dropped bombs on Romagne and Cunel and engaged in battles with German machines, bringing down six of them.

Americans Keep Up Victories in the Air

With the American Army northwest of Verdun.—Aerial activity continues despite the rainy weather. American pursuit groups making sorties from early morning until dark have accounted for twenty German machines and seventeen balloons in the last three days.

The American pilots continue to fly low over the battlefield and harass the troops and supply movements. American bombing squadrons got good results yesterday at Grandpre and at Marcq, southeast of the former place.

American Headquarters in France—The outstanding achievement of the American Army in the offensive is undoubtedly to the credit of its aviators, who have done all that was expected of them and much more.

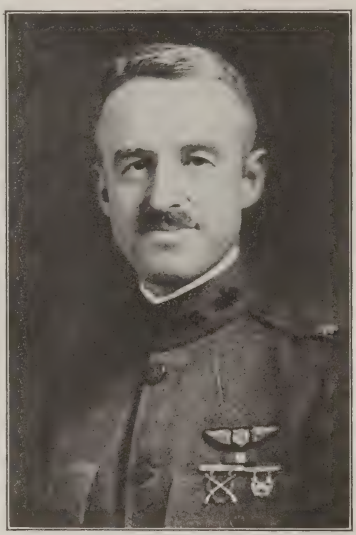
General Pershing's report on September 28's operations stated that the Americans had "brought down twelve balloons and more than sixty enemy planes, while less than a third of that number of our planes were missing."

On September 28 the distance covered by the aeroplanes of a single wing of the service amounted to 44,150 miles. They fought fifty combats and destroyed nineteen machines without loss to themselves.

One patrol met ten enemy aeroplanes between Charpantery and Ivoiry, sent down one in flames, caused five to crash and drove down two out of control.

Another patrol, diving through a hole in the clouds to drop bombs, came upon seven Fokkers which were almost immediately joined by seven more. The Americans immediately got rid of their bombs and attacked the Fokkers. During a twenty-minute mix-up, which took the combatants from Sommerance to Liny, seven enemy aeroplanes were destroyed and the remainder scattered in all directions.

In addition to these successes the German balloons were literally swept from the sky. Indeed, the maintenance of a single balloon in the air is taxing all the enemy's ingenuity, for these cheerful American youngsters are by no means content with shooting down the balloons at their maximum altitude. Nothing pleases them more than to get a balloon just as it is brought down for the night, or is about to rise in the morning.



Lieut. Frank Luke, of Phoenix, Ariz., who the other day brought down three aeroplanes and two balloons in ten minutes, is an expert at getting the balloons "in their beds," dropping within 150 feet of the berth to do it and being blissfully indifferent to the riddling of his wings with bullets. In one instance he pounced upon a balloon being placidly towed to its position behind its lorry. Before the drivers were aware of it the gasbag was in flames behind them.

One pursuit group has sixty-five victims to its credit within three weeks after its arrival at the front, thirty-five of these being balloons.

The German balloon has become a rarity on this front any time after noon, and those that survive the day generally perish at nightfall, for it is the twilight period at both ends of the day that is the most favorable time for attack.

An American officer descending in a parachute after his observation balloon had been set on fire by a German aviator has had the experience of being fired upon and having his parachute pierced by machine gun bullets during the descent. When the observer saw the German aeroplane approaching he went over the side of the basket. A second afterward the balloon burst into flames from incendiary bullets fired from the German machine.

The observer was astonished to see the German turn and begin firing on him. Five bullets pierced the parachute, but the observer landed unharmed.

Colonel T. H. Bane is in charge of the Technical Section of the Division of Military Aeronautics, the organization which passes on designs of aircraft and accessories which it receives from both the Aircraft Board and from outsiders. This section is now moving from Washington to Dayton, Ohio. This move brings the entire section closer to its experimental field at Fairfield, Ohio

American Official

The Americans with the British and French dominated the air, Gen. Pershing reports. This fact is believed to have had undoubted effect on the military operations. Gen. Pershing's report follows:

American aviators have kept command of the air. They have brought down twelve balloons and more than sixty enemy planes, while less than a third of that number of our planes are missing. In conjunction with French and British aviators, they have, notwithstanding unfavorable weather, rendered valuable service and successfully executed many missions.

Since September 26 our aviators have shot down more than 100 hostile planes and twenty-one balloons.

Second Lieutenant George L. Bradford, Caproni Pilot at Mineola, L. I.

The D. H. 4

(Statement by Major General Wm. L. Kenly)

A captain of the Air Service, recently arrived from France, has reported to me that the first de Haviland 4 planes with Liberty motors arrived from the United States at stations in France as early as May 13, 1918, and since that date have been coming in ever increasing quantities. This officer left the assembling station in France on August 20. He said that it had been necessary to make some changes on the first planes received, but that each succeeding shipment evidenced better care, and, in general, when he left these aeroplanes were very satisfactory.

In his report he also said: "The performance of the planes was very good, and the plane and motor has become very popular with our pilots. We obtained approximately 130 miles per hour at ground level with one plane, and had without any special preparation obtained an altitude of 10,000 feet in 10 minutes and 21 seconds, full load, excepting bombs. We were able to loop, dive and otherwise stunt these planes exactly as well as we would any chasse plane.

"When I left the post, the planes were arriving at the rate of 15 to 18 per day. The cars were unloaded by our steam crane, and fuselages unpacked in one bay (platform), wings in another bay, and assembly was progressive, similar to the method used in automobile construction.

"After gun test, engine test, and final assembly, the compasses were tested and corrected for permanent magetnism. The machines were then sent to the flying field and were given test flight. After final approval they were then dispatched to stations for assignment to squadron.

"Air-test pilots and ferry pilots were all of the opinion that the plane was excellent. The French ministry thought so well of the Liberty motor that the Under Secretary of State for Aviation, Monsieur Dumesnil, informed me that the French would gladly take every motor we could produce which we could not use ourselves. I was also given the same information by Capt. de Haviland, the designer of the de Haviland plane.

"Lieut. Col. Warwick Wright, Royal Air Force, stated to me that the method of packing the plane was considered by the British to be so good that it could not be improved upon. Out of 750 cases which I inspected, I only discovered one in which the contents were badly damaged."

De Haviland 9 in Record Flight

Flying from McCook Field, Dayton, Ohio, to Bolling Field, Anacostia, D. C., with no stops, a de Haviland 9 plane, equipped with a Liberty engine, made the distance from field to field in three hours and five minutes. Taking the time of actual flight from a point over the city of Dayton to a point over Washington, the time was two hours and fifty minutes, or at approximately 143 miles an hour. The distance between these two cities is estimated at 430 miles, and it takes the fastest train on the Pennsylvania Railroad from 4:50 in the afternoon to 9:00 in the morning on the next day to make this distance.

Caleb Bragg, the civilian pilot, who flew the plane, is attached to the Engineering Department of the Bureau of Aircraft Production. He carried as passenger an engineer officer. The pilot travelled by compass at a high altitude and reported that he had no difficulty in holding his course the entire distance. He also stated that the atmosphere was clear and that he had the advantage of a favorable wind.

Captain Bartlett, Famous Explorer, and Two Aviators, Sold For $40,000 Liberty Bonds

Capt. Robert A. Bartlett, the famous explorer who participated in five Arctic expeditions, and was Admiral Peary's captain in the dash to the North Pole, and two Army aviators, were sold for $40,000 of Liberty Bonds by Mrs. Plummer, of the Liberty Loan Committee.

The sale took place at Terrace Gardens on Sunday, Oct. 6. The Aero Club of America arranged for Capt. Bartlett and two aviators to be present to carry out Mrs. Plummer's novel idea of selling bonds by "selling" Capt. Bartlett and the two aviators.

The plan was also successful the day before when Mrs. Plummer sold two Army aviators sent to her by the Aero Club of America for $25,000.

The bids for Capt. Bartlett were especially lively. In introducing him Mrs. Plummer stated that Capt. Bartlett, who is in the Transport Service, stationed at Hoboken, holds an exceptional record of being accomplished not only in the exploration line, but also in war work. She told how Capt. Bartlett last winter was selected to perform the difficult task of taking the cruiser "Favorite" out of the ice and read the following letter from Secretary of the Navy Daniels commending Capt. Bartlett for accomplishing this difficult task.

Capt. Bartlett, in his capacity of Captain in the Transport Service, has had a great deal to do with sending troops overseas, but for obvious reasons the Capt. will not talk on the subject.

After the lively bidding Capt. Bartlett was "sold" for $25,000 for tea and the two Army Aviators for $5,000 and $10,000 respectively.

The AIRCRAFT TRADE REVIEW

Canada Buys Flying Boat for Fire Patrol

In line with the decision announced some time ago to improve the system of forest protection, the British Columbia Provincial Government has contracted with the Hoffar Motor Boat Co., of Vancouver, for the construction of a patrol flying boat to be utilized for forest patrol.

Some two years ago this up-to-date method of forest protection was the subject of discussion at a gathering of Northwest lumbermen at Portland, and the idea of an air force of fire wardens was strongly advocated as both practical, economical and efficient. The great stretch of country that an airship could keep guard over, and the ability to distinguish the first beginnings of fire and ripidly get help to the spot to prevent its spread, were factors that appeared to be especially within the province of an air patrol. The idea has been seized upon by British Columbia, and will within a month or two be put into operation.

At first it was thought possible to arrange with the Imperial Government for the leasing a machine from the naval force, one of the obsolete hydroaeroplanes. But this idea has been abandoned in favor of the purchase of a flying boat type, which will be better adapted to the purpose. The machine contemplated will carry the pilot and one fire warden, it will have a wing spread of forty-two feet, and chord of five feet, will develop 100 horse-power, and have a speed of seventy-eight miles per hour, and a climbing capacity of about 3,000 feet in ten minutes.

Britain Is Using the Liberty Motor

(From the British Bureau of Information.)

The engine has always proved to be the limiting factor in the production of aeroplanes. Machines themselves can always be produced in quantities considerably in excess of engines. Large numbers of Liberty engines have been ordered by Great Britain from this country for installation in British machines. The Liberty engine has been described as excellent, and its performances on British testing grounds have been reported as being highly satisfactory.

The present Rolls-Royce engine was designed during the first fortnight of the war, and its horsepower was to have been approximately 250. It took 18 months to develop an engine which would give best results in the air and it has only been within the last six or eight months that this engine has been produced in any quantities, so the United States have done well in designing and obtaining an output of an aeroplane engine in the space of 14 months.

The Liberty engine has been submitted to a thorough test in England and France and in the opinion of experts it is sound and will be greatly improved upon after a few months' use under active service conditions. The Rolls-Royce, though at the moment considerably more reliable, gives slightly inferior performance, but it is as well to remember that the Liberty engine is not the last word in aerial motor construction, and that other experimental engines have been designed and manufactured which excel even the Liberty. Since, however, the Liberty engine has now been put on a productive basis, and great numbers are being turned out daily, we want as many of them as we can get; otherwise, by the spring of next year, we shall have many machines in storage without engines.

In the early days of the war the British expeditionary forces went over to France with some 60 odd machines of every type, which were used for every purpose. Nowadays there are special types of machines built to carry out certain functions, and among them are the following:

Fighter—high altitude—Single seater machines, giving the highest possible performance, which attack all enemy machines that may cross our lines.

Fighter—low altitude—Single seater machines, giving the highest possible performance, which attack all enemy machines that may cross our lines.

Fighter—low altitude—Single seater armored machines for low flying work, and attacking infantry formations on the ground.

Fighter—reconnaissance—Usually a two seater machine of high performance, which flies a considerable distance behind the enemy's lines, and is used for reconnaissance work or protecting bombing machines.

Corps reconnaissance—Two seater machines of moderate performance, which do photographic work and artillery observation.

Day bomber—A high performance long range machine, with large bomb carrying capacity.

Night bomber—Similar to the day bomber, but with greater carrying capacity and less speed.

Personal Pars

Graham W. Brogan has been appointed advertising manager of the Duesenberg Motors Corp., Elizabeth, N. J. He was formerly assistant to the general sales manager.

To Make Aeroplane Parts

Milwaukee, Wis.—The Lochman-Mayhew High Speed Propeller Co. has been organized at Milwaukee to engage in the manufacture of aircraft and hydroaeroplane parts. Articles of incorporation have been filed and give the capital stock as $1,000, which is to be increased later. The principals in the new organization are Emil R. Lochman, owner of the Lochman Machine Co., and William H. Mayhew, first vice-president of the Mayhew company, cabinet and furniture manufacturer.

Range of Travel Governing Factor in Aeroplane Future

Detroit.—Range of travel is the greatest problem which must be solved in determining the future of the aeroplane industry, according to C. F. Kettering, president of Delco and the S. A. E. President Kettering's address was given on the occasion of the first Detroit Section meeting for the year, held at the Hotel Pontchartrain on September 20.

The topic, "The Future of the Aeroplane Industry After the War," was of popular interest in this section, as shown by an attendance of 600 local S. A. E. members and their friends. Mr. Kettering largely repeated the address he gave before the Cleveland Section.

Inspection of Aircraft Factories Complete

The War Department authorizes the following: W. C. Potter, Acting Director of the Bureau of Aircraft Production, who has returned from an inspection of factories engaged in the manufacture of engines and planes, announced that the output of Liberty engines was fully up to expectation and had reached quantity production. Planes were now going ahead rapidly, he said, and were being shipped in trainload lots daily.

Aerial Posts in Morocco

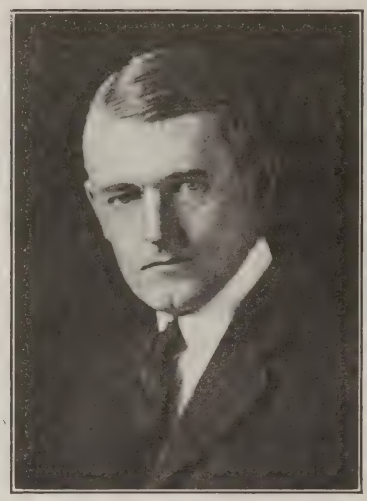
In connection with the inauguration of aerial mails in France, it is pointed out that for over a year aeroplanes have been officially used in Morocco for linking up the various units. Each sub-division has a squadron at its disposal, the airmen ensuring a service between the chief town of the sub-division and distant outposts. They carry the ordinary mails, urgent despatches, and telegrams impossible to send by wire. Finally, they see that certain posts are kept in funds. All these activities are carried out automatically, without interferring with the normal service of the bombing, photographic, and patrol squadrons. It is suggested that in future it might be possible, by means of an agreement between the Morocco Protectorate and the Government of Algeria to establish aerial postal communication with the great North African colony, which would benefit no less than Morocco by the economy in time and expense thus assured.

Goodyear Engineer Goes to Government

William S. Wolfe, assistant chief experimental engineer of the Goodyear Tire & Rubber Co., Akron, Ohio, has entered the service of the maintenance division of the United States Government Motor Transport Corps, with headquarters at Washington, D. C. His six years' experience in tire development with the Goodyear company well equips him for his present duties in assisting in looking after the maintenance of all tires, rims and wheels in the motor transport service.

New Directors for Standard Aircraft

Elizabeth, N. J.—Joseph A. Bower, vice-president of the Liberty National Bank of New York, and Henry J. Fuller, vice-president of the Fairbanks-Morse Co., have been elected directors of the Standard Aircraft Corp. and the Standard Aero Corp. of New York.



Franklin to Make Hispano-Suiza Parts

Syracuse.—The H. H. Franklin Mfg. Co. has received a contract from the Wright-Martin Aircraft Corp. for parts of Hispano-Suiza engines.

Women have taken up numerous kinds of munition work. Here is shown some of the work they are doing in the aircraft factories

Second Assistant Secretary of War John D. Ryan, Acting Director of Aircraft Production W. C. Potter, and Major General William S. Kenly, Director of Military Aeronautics

Officers of the Air Service Clubs Association

The Army Air Service announces the organization of the Air Service Clubs Association, which will incorporate all local Air Service Clubs recently organized at some of the flying fields and training stations.

The purpose of the Association is to promote the efficiency of the Air Service; to foster esprit de corps by maintaining its best standards and traditions, to disseminate professional knowledge and provide means for social activities at all places where members are stationed.

All officers of the various branches of the Air Service, civilian employees who are heads of departments of the Air Service and all foreign officers on duty with the Air Service are eligible to membership.

The second meeting of the Association was held in the Interior Building at Washington, on Tuesday, October 2, and was attended by about 300 officers of the Air Service stationed at Washington. Major General Wm. L. Kenly, Chief of the Division of Military Aeronautics, presided. Captain J. H. Packard, head of the Aeronautical Information Branch of the Air Service, acted as Secretary. Following the adoption of the constitution, an election of officers was held, and the following officers were elected:

Major General Wm. L. Kenly, President; W. C. Potter, 1st Vice-President; Col. G. C. Brant,, 2nd Vice-President; Col. G. C. Edgar, Treasurer; Lt. Col. H. S. Brown, Assistant Treasurer; Captain John H. Packard, Secretary, and 1st Lieut. Tom Poe, Assistant Secretary. John D. Ryan, Assistant Secretary of War, was elected chairman of the Board of Control, and the following were elected members of the Board of Control: Col. H. H. Arnold, Col. W. E. Gillmore, Col. C. A. Seonne, and Mr. A. A. Landan, for one year; Col. Arthur Woods, Col. F. R. Kenney, Col. G. H. Crabtree, and Mr. C. W. Nash, for two years; and Col. A. L. Fuller, Lt. Col. B. F. Castle, Lt. Col. Millard F. Harman, Jr., and Major Wm. R. Malone for three years.

It is the purpose of the Air Service Clubs Association to issue a magazine periodically and to organize clubs at all Air Service flying fields and stations.

Members of Association Will Enjoy Privileges of Aero Club of America and Affiliated Aero Clubs in All Allied Countries

The members of the Air Service Clubs' Association will enjoy the privileges of the Aero Club of America and affiliated aero clubs in all allied countries. Through this co-operation with the Aero Club of America the members of the Air Service Clubs' Association will enjoy the privileges of the club house in New York, the new Allied Aviators' Club of the Aero Club of America in Paris, the Aero Club of France, the Royal Aero Club of Great Britain, the Royal Aero Club of Italy, etc., etc.

General Kenly Witnesses Test of New Oxygen Apparatus

A new style oxygen apparatus, designed to enable aviators to fly at high altitudes, was given an official try-out in connection with the War Department at Grant Park, Chicago, on Sunday, September 8th, before a group of prominent officials of the air service of the government. Among those who witnessed the test were Major General W. L. Kenly, Director of Military Aeronautics; Brigadier General T. C. Lyster, M. C., of the Air Service Division; Surgeon General's office; Lieutenant Colonel Isaac Jones, M. C.; Lieutenant Colonel C. K. Rhinehardt, and Lieutenant Colonel E. R. Lewis, M. C.

The flight was made by Lieutenant M. B. Kelleher and State Senator Albert C. Clark of Illinois in one of the new model De Haviland 4 aeroplanes, equipped with a Liberty motor. In view of the nature of the flight, unusual precautions were taken to have the plane in first class condition. Before the machine was permitted to go up, Lieutenant Kelleher and Senator Clark were given a thorough physical examination by General Lyster personally.

According to the official report of the flight, the aeroplane left the ground at 12:55 P. M. The pilot took a southerly course mounting to fifteen thousand feet in seventeen minutes. At nine thousand feet it was necessary to detour around a large cloud bank so that the machine would not become moistened and affected by the low temperature in higher altitude. Slight motor trouble impeded for a few minutes the upward flight of the machine but the source was found quickly and corrected.

It took the aeroplane thirty-five minutes to climb from fifteen thousand to twenty-three thousand five hundred feet during which time, the report continued, exceptionally fine atmospheric conditions were encountered. A temperature of seventeen below zero was recorded at this altitude.

As soon as the rarity of the air became noticeable the flow of oxygen in the apparatus was permitted to start. The device functioned perfectly from the start, Lieutenant Kelleher and Senator Clark reported. Breathing was as natural, they said, as on the ground.

The pilot was compelled to start the descent to earth at the height of 23,500 feet, as the danger signal showed on the apparatus. At this height, the pilot and passenger said, they were able to breathe with ease by means of the device.

The aeroplane descended at the rate of a thousand feet a minute. The descent from the maximum altitude to the earth took twenty-five minutes. Both pilot and passenger experienced slight physical discomfort for a time by reason of the extremes of temperature.

In the opinion of Lieutenant Kelleher, the maximum altitude had not been reached. Additional tests may be made in the future to determine the effectiveness of the oxygen apparatus at greater heights in the air. Lieutenant Kelleher was enthusiastic over the performance of the De Haviland 4.

Aero Club's Annual Meeting

THE annual meeting of the club will be held at the club house, 297 Madison Avenue, New York City, on the second Monday in November, 1918, at 8:30 P. M.

Whereas a large part of the members of the Aero Club of America are in Government service and their addresses changed constantly, and that it takes longer for mail to reach them; and Whereas, the Government has issued instructions that Christmas presents for men overseas shall be mailed before November 12, therefore, the system of transportation of mail may be congested in the latter part of October and early in November, and Whereas, it is a patriotic duty of the Club to assist the Government and our members by mailing any notices or reports before the October and November rush; the Executive Committee, acting under Article 3, Section 2, of the Constitution, resolved to send out notices of the annual meeting to non-residenet members and to members who are known to be in Government service immediately.

Following are the nominees for officers and governors: For President, Alan R. Hawley; for Vice-President, Henry A. Wise Wood; for Second Vice-Presideent, Godfrey L. Cabot; for Third Vice-President, Rear Admiral Bradley A. Fiske; for Fourth Vice-President, Chas. Jerome Edwards. For Governors, Class A, Term Expiring 1922, Lieut.-Col. James A. Blair, U. S. A.; Henry Woodhouse, Allan A. Ryan, Rear Admiral Bradley A. Fiske. Class A, Term Expiring 1921, William Hawley. Governors, Class B, Major Albert B. Lambert, U. S. A.; Henry B. Joy, Lieut. Godfrey L. Cabot, U. S. Navy; George M. Myers, John Hays Hammond, Jr., Alberto Santos-Dumont, Brig.-General Robert K. Evans, U. S. A.; Major Max C. Fleischman, U. S. A. For Treasurer, Lieut.-Col. Charles Elliot Warren.

It is proposed to amend Chapter IX of the By-laws to meet the exigencies of war and enable the club to better protect the welfare of the United States, Allied Countries and the Aero Club of America.

The activities of the Aero Club of America during the past year have been extensive. The Army and Navy membership of the club has increased by over 350, due to the popularity of the club with both branches of the Service. A considerable number of military aviators applied for memeership from France, their desire to become members has been created by learning of the club's remarkable work in the assisting of the building of our Air Forces, and in helping the members of the Air Service in every possible way in the United States as well as overseas.

The club has assisted and is assisting in the building of the Air Service from every standpoint. Its efforts to make Congress recognize the necessity of a substantial Air Service and its efforts which resulted in training 300 aviators at private expense, who were taken in the Army and Navy upon America's entering the war, and who were the first 300 aviators to be sent overseas, are matters of history, thoroughly appreciated by the American and Allied Governments.

The club's care of the members of the Air Service begins with giving advice to candidates who wish to join the Service, directing them to the proper authorities and supplying them with any information which may speed up their entering the service and their becoming efficient. From the time they join the Service to the time they are ready to go overseas, the club acts as their adviser, and when it becomes necessary it helps them in other ways. During the early part of the year it become necessary for the club to represent the Army and Navy aviator's before Congress, preventing the cutting down of the aviator's pay. During the past winter and early spring the club assisted in looking after the welfare of members of the Air Service who need clothing and equipment while training and when going overseas.

The club looks after the welfare of the aviators overseas through its Foreign Service Committee, which has headquarters in Paris and which looks after the interests of the Air Service as closely as the club does in the United States, supplying aeronautic books and magazines, aeronautic maps, athletic equipment, games, etc., etc., and otherwise contributing in every way possible to their general comfort. The funds for this work have been procured under the auspices of the club.

The Foreign Service Committee also assists in locating aviators who are missing or prisoners, notifying parents, and represents the club and parents, whenever possible, at the funerals of those who have died in service.

When an aviator distinguishes himself, he is awarded the Aero Club of America's Medal of Honor, which is very much appreciated and sought after, not only by the American, but also by the Allied aviators. The club has received personal letters of appreciation of Medals from the two premier French Aces, Lieut. Fonck and Lieut. Nungesser, who called in person at the offices of the Foreign Service Committee to express their appreciation. While they were at the office, an enormous crowd of admirers gathered outside, and when the two aviators with the members of the Foreign Service Committee drove through the streets they were showered with roses.

The letters from American and Allied officers and from the highest American and Allied authorities, and from parents and aviators, and from patriotic Americans, praising the patriotic work of the Aero Club, would fill many books. They are being preserved, and it is possible that after the war they will be reproduced in book form, to make a historic record of the club's contribution to the prosecution of the war.

The club has continued its constructive activities for the extending and upbuilding of our Air Forces, fostering the developments of the aeronautic industry and the establishing and extending of the Aerial Mail Service, and educating the nation to its aeronautic task. It has also been active in the Liberty Loan, War Savings Stamps and Red Cross Campaigns.

The club has 800 members in the Service, all serving as commissioned officers, with a few exceptions, who are working with civilian status in different departments of the Government.

Aerial League of America Elections

THE election of directors of the Aerial League of America was held at 297 Madison Avenue, New York, on September 30.

The following directors were unanimously elected, over one thousand members voting in person or by proxy.

Directors, term of office to expire in August 1922: Rear Admiral Robert E. Peary, Alan R. Hawley, Henry Woodhouse.

Directors, term of office to expire in August, 1921: Henry A. Wise Wood, Charles Jerome Edwards, Augustus Post.

Directors, term of office to expire 1920: Brigadier General Robert K. Evans, U. S. A., Mrs. Henry A. Wise Wood, Mrs. William A. Bartlett. Directors, term of office to expire in August, 1919: Hon. Murray Hulbert, John Hays Hammond, Jr., Mrs. Marie E. Peary Stafford.

The League during the past year has done an enormous amount of patriotic work. It had a Float in the First Liberty Loan Parade in New York, and its officers and many of the members delivered addresses and participated actively in other ways in each of the Liberty Loan, War Savings Stamps, and Red Cross campaigns.

The League contributed largely to the success of the French Aerial Warfare Exhibit. One of the League's officers, Mr. Henry Woodhouse, was elected by the French authorities to be the Honorary Director of the Exhibit, and has acted in this capacity since last March, making all the arrangements to send this wonderful exhibit through the United States. As a result, not only has great interest been created in winning the war, in building our air forces, and in the Liberty Loan and in the Red Cross, but over $50,000 has been raised for the orphans of French aviators and maimed aviators.

The League has conducted a very extensive educational campaign, sending speakers to deliver addresses and showing aeronautic films to different parts of the country. It also took a prominent part in the establishing and making a success of the Aerial Mail Service, which has an important value from a military as well as a commercial standpoint, and supplied aeronautic literature to army and navy aviation stations.

These are only some of the important things accomplished during the past year by the League, the offices of which have become the clearing house to which officers and men in the Air Service, and men, women, and boys and girls write for advice and information.

On motion it was resolved to elect to honorary membership of the League Second Assistant Secretary of War John D. Ryan, Major General William L. Kenly, Director of Military Aeronautics, Second Assistant Postmaster Otto Praeger and Captain B. B. Lipsner.

A vote of thanks was expressed to Mr. Henry Woodhouse for his energetic work on behalf of the League. By his work Mr. Woodhonse has put the League on a self-supporting basis and membership of the League up to over 4,000 members, and extending its work overseas.

A vote of thanks was also extended for the hearty and substantial co-operation given to the League by officials of the Aero Club of America, especially by Messrs. Alan R. Hawley, Henry A. Wise Wood, and Augustus Post.

A hearty vote of thanks was extended to the Aero Club of America and its officials, not only for the assistance given to the League, but also for the inspiring example set by the club in every line of patriotic and aeronautic endeavor.

Expressions of appreciation were voted to Mrs. William A. Bartlett, chairman, and Mrs. Eliot Butler Whiting, Mrs. C. Lansing Baldwin, and Mrs. John H. Booth, members of the Aviation Committee of the National Special Aid Society; and to Mrs. Charles A. Van Rensselaer, Mrs. Henry A. Wise Wood, Miss Alice Carpenter, Miss Amy Grant, and Miss Portia Willis for their splendid work in looking after the welfare of our aviators.

MILITARY AEROSTATICS

By Lieut. H. K. BLACK, R. F. C., C. F. A.

A VERY necessary thing for a balloon bed is dryness. This, of course, is a relative term in France, and so long as a balloon bed is well drained that is about all that can be expected. The bed can be trenched around the same as a tent, but a word of advice, if you trench around a balloon bed, be very sure that you cover the trench with duck boards of some kind. Otherwise sometime, when the crew is holding down the balloon two or three are going to fall into the trench or rather step into it, and then there is going to be trouble. I once knew of a balloon blowing away just from that, and several of the crew who held on till they were well off the ground fell thirty feet or so and were badly smashed up.

However, when the site of the balloon bed has been decided upon,—as I said before it should be sheltered and drained, a gentle slope is not a bad position,—the preparation is an important part of the subsequent success of the bed. The bed must be very smooth. If it is so naturally, so much the better, but if it is lumpy, or rocky, or has small almost buried roots, these must be removed before proceeding further. In France, on several occasions, we removed roots and stumps by blasting. We found this very satisfactory. It not only removed the roots and stones but it also stirred up the subsoil in such a manner that drainage was facilitated. The ground after the blasting should be ploughed a bit and the roots taken out, put back in the holes and the whole covered with earth. The earth when smoothed should be covered with broken rock or small gravel. In France, particularly in the coal region, the slag from the mines makes an ideal bottom of the bed. A layer of slag broken into small pieces should be used for a top layer and then a top dressing of fine sand laid on. The top layer and the top dressing should be crowned slightly in the center. On top of this prepared bed the ground cloth of heavy tarpaulin or canvas should be laid and stretched tight. The cloth should be made fast to the ridge wire around the edge of the bed. This ridge wire is a thin steel cable which forms the periphery of the actual bed itself. It is fastened very securely by means of screw pickets screwed into the earth and one needn't be afraid of getting it too secure for it has a very heavy strain to bear. I have seen a four-foot screw picket, yes, several of them, torn out of the ground like a rotten tooth when a wind storm caught the balloon.

Of course a balloon offers a wonderful target for the wind when it is on its bed and it is almost unbelievable what a strain the ridge wire is under. One storm we had, I remember, we had the balloon weighted down with sandbags until we thought the bridles of the rigging would break. We put canvas bridles over the balloon, we weighted the mooring lines, we did everything we could think of to keep the gas bag on her bed, yet all our efforts were unavailing. An extra gust of wind hit her broadside and the balloon broke the mooring lines, the canvas bridles, tore the ridge wire out of the ground, bringing with it the screw pickets and numerous straight wooden pickets.

Incidentally, here it might be remarked that it is standard practice to fasten the rip cord securely to a separate picket driven well into the earth. On this occasion that did not do us any good. The rip cord simply tore the picket out of the ground and the balloon did not rip. There was so much weight on the gas bag, somewhere in the neighborhood of a ton, that she couldn't rise even when she did get away. She floundered along the ground with the wind, treating several tents which were in her path very much the same as if she had been a tank instead of a well brought up civilized balloon. Next she bumped through an artillery horse lines, shedding sandbags en route, much to the consternation of the horses, who just naturally stampeded. Finally the old sausage charged a tree with the evident intention of flattening it out. The tree, however, proved to be an old customer who had been through several battles and was still standing. The sharp, jagged branches crashed through the envelope, the gas rushed out whistling, the sausage shuddered, and in a very few seconds a perfectly good balloon was hanging, a mass of shredded fabric, entirely deflated, on the old tree. Yes, the ridge wire should be put down securely.

Stakes are driven, out from the sides of the bed, and also at the ends for the mooring lines.

It is very important in connection with bedding down a balloon, that the bed be kept absolutely clean. Small stones, twigs, even a little bit of mud or clay, will soon wear a hole in the fabric of a balloon, particularly if the balloon is not absolutely tight on its bed. This is seldom the case, as almost always there is a little regular chafing movement of a sausage on its bed. To bag a balloon down to its bed so tightly that there is no possibility of movement necessitates so much sand on the rigging as constitutes a strain on it. The valve cord must be let go of course else the valve would act from the increase of internal pressure. Then, of course, with the valve let go, the pressure on the interior of the envelope is apt to rise to or beyond the straining point.

The saddle referred to previously is a canvas strip or in some cases a canvas sheet which is put over the top of the balloon and moored securely to the ground outside the ridge wire. It is of great assistance in keeping a balloon on its bed during a wind storm. During the windy season, however, and in fact almost any time, a screen is a very necessary thing. This screen is naturally placed in those cases where a balloon is bedded down among trees, or between avenues of trees. In cases where a balloon is bedded down in the open, however, it is necessary to erect a screen. Practice only will tell one what kind of a screen is best.

(To be continued)

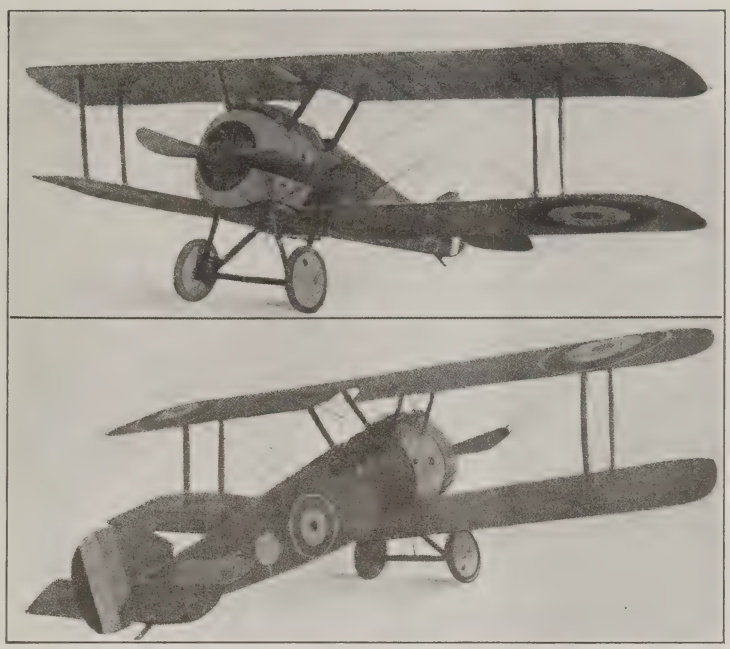
Laying out a French observation balloon in France. The ground cloth is spread on the bed and the balloon removed from its covering and stretched out, unfolded from the centre outward and the rigging attached. It will be noted that the bed is sited in a well sheltered position. The men work on the balloon bed either in their stocking feet or else in soft rubbersoled shoes. The filling hose may be seen running toward the middle of the balloon. The sand bags seen in the left background are used for holding the balloon on its bed, and not, as some people seem to think, as a protection from fire. In the far background may be seen some very typical dugouts; in fact the whole scene is one which is very common in France

THE SOPWITH "CAMEL"

THE following facts and photograph of the Sopwith "Camel" have been translated from a German contemporary:

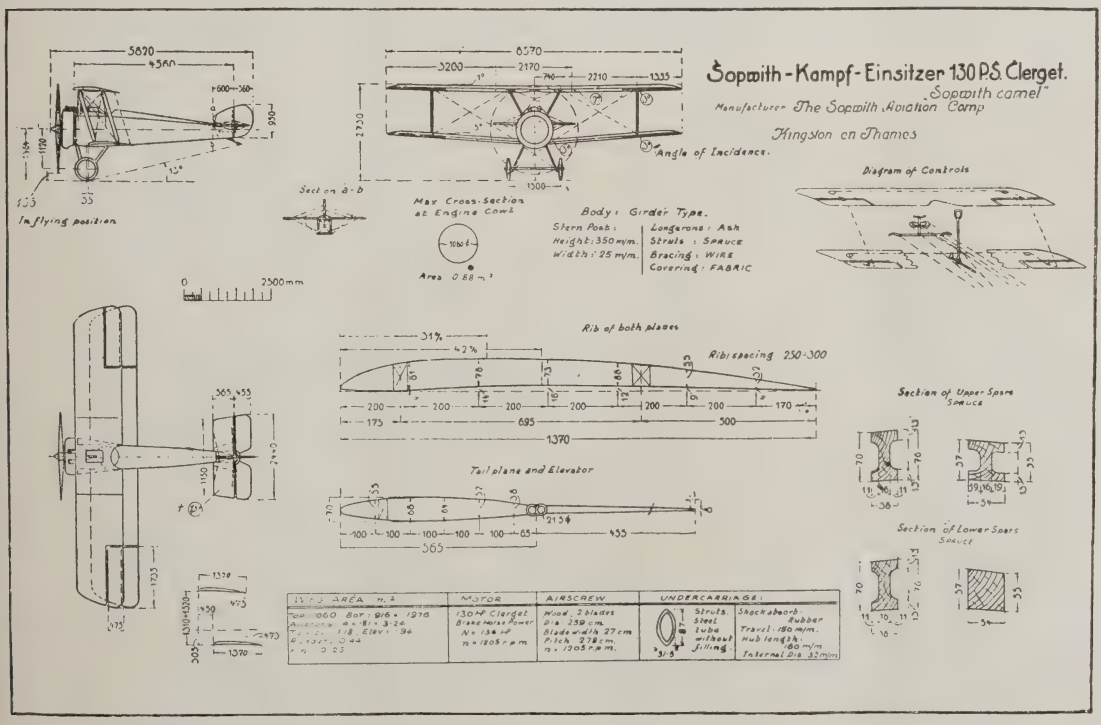
This machine, built by the Sopwith Aviation Co., Ltd., of Kingston-on-Thames, carries the designation F.1 B. 6290. It is a single-strutter machine and is a development of the Sopwith "Pup," from which, however, it differs in many details, apart from the greater power of its engine.

As in the older type, the wings and tail plane with elevator are of trapezoidal plan form, but the greatest span occurs at the trailing edge. The top plane centre-section has a span of 2.17m., while the strut attachments are only 1.48m. apart. As the petrol pressure tank and gravity tank are placed rather far aft, the pilot's seat is placed immediately behind the motor, underneath the top plane centre-section. In order to provide a better view, a rectangular opening is cut in the centre section. The longitudinal edges of this opening are provided with three-ply plates projecting beyond the wing profile so as to reduce the amount of air flowing over the edges. To facilitate getting into and out of the machine the trailing edge of the centre-section has been cut away. Upper and lower planes have an equal span of 8.57m., and an equal chord of 1.37m. The aspect ratio is therefore 6.25 against the aspect ratio of 5.15 of the older type.



The wing spars, which are made of spruce, are spindled out to an I section, with the exception of the bottom rear spar, which is left solid. The gap between the planes is 1.31m. at the tips and 1.52m. near the body. (In the older single-seater the gaps were 1m. and 0.86m., respectively.) The upper plane is staggered forward 0.45m. There is no sweepback. The dihedral angle of the top plane is 178 deg. and of the bottom plane 170 deg. The angle of incidence of the top plane is 2 deg. at the centre-section, 3 deg. at the tip. The bottom plane has a uniform angle of incidence of 3 deg.

The inter-plane struts, which are of solid spruce of Streamline section, are, as in all Sopwith machines, placed with their ends in steel shoes welded to the fittings on the wing spars, and are provided with no further attachment. The lift wires and landing wires, of which the former are in duplicate, are in the form of stream-line wires.



Non-balanced ailerons are fitted to the rear spars of both planes. The wing fabric, which is sewn on to the ribs, is cream colored underneath, and the top surface, as well as the body fabric, is painted a redish brown. The body, which is of the usual girder type with four longerons, has a rounded top. The undercarriage is of the usual Sopwith type. A divided aluminum axle rests in a stream-line covering of wood. The axle hinges are braced from the fuselage.

The tail plane, which is deeply cambered on both sides, is rigidly attached to the upper body longerons, with an angle of incidence of 1.5 deg. The tail plane trimming gear hitherto fitted to all Sopwith machines has been abandoned, in spite of the fact that the petrol tanks are placed behind the pilot's seat. The fin and rudder are of the usual characteristic Sopwith form.

The 130 h.p. Clerget motor, which is built by Gwynnes, Ltd., develops about 134 h.p. at 1,200

Two views of the Sopwith "Camel"

r.p.m. According to a plate in the pilot's cockpit the revolutions of the engine are not to exceed 1,250 r.p.m.

In the pilot's cockpit are the following instruments, &c.:

In the centre on the instrument board: Monometer, with safety valve, clock, pressure gauge, altimeter, compass, two switches, revolutions indicator, and pulsometer. On the right: The hand-pump (air). On the left: Control levers for pressure and gravity petrol tanks, petrol tap, throttle lever, petrol level indicator for pressure tank, Bowden cable for bomb release. A propeller air pump for the pressure tank is mounted on the starboard chassis strut. Two fixed Vickers guns are mounted on top of the fuselage. Their locks and feed block levers are inside the body covering. Between them is a telescopic sight. In a bomb rack under the body can be carried four bombs, the Bowden controls for which are placed to the left of the pilot. There is no bomb sight fitted.

The weight of the machine empty was ascertained to be 430 kg. With tanks full the weight of the fuel is 150 kg. With pilot and armament the useful load would then amount to 290 kg. It is therefore to be assumed that the weight of about 50 kg. of bombs is only carried when the tanks are not full. Assuming a useful load of 290 kg. the total weight "all up" amounts to 720 kg. As the wing area is 19.76m², the unloading is 36.5 kg. per sq. m., and the loading per h.p is 720; 134 = 5.37 lbs./h.p. The corresponding loadings for the Sopwith "Pup" were 23.4 and 6.6, respectively. The "Camel" has, therefore, a higher wing loading, but a considerably smaller loading per h.p.

THE A. E. G. ARMORED BIPLANE

THE Technical Department of the British Air Ministry has issued the following report and description of the A. E. G. Armored Biplane:

This aeroplane is designed for the purpose of carrying out offensive patrols against infantry, and is furnished with armor, which affords protection for its personnel. This armor appears, however, to be more or less experimental.

In general construction it closely follows the lines of the A. E. G. Twin Engined Bomber G. 105, reported on in I. C. 606, though the arrangement of the power plant is, of course, entirely different.

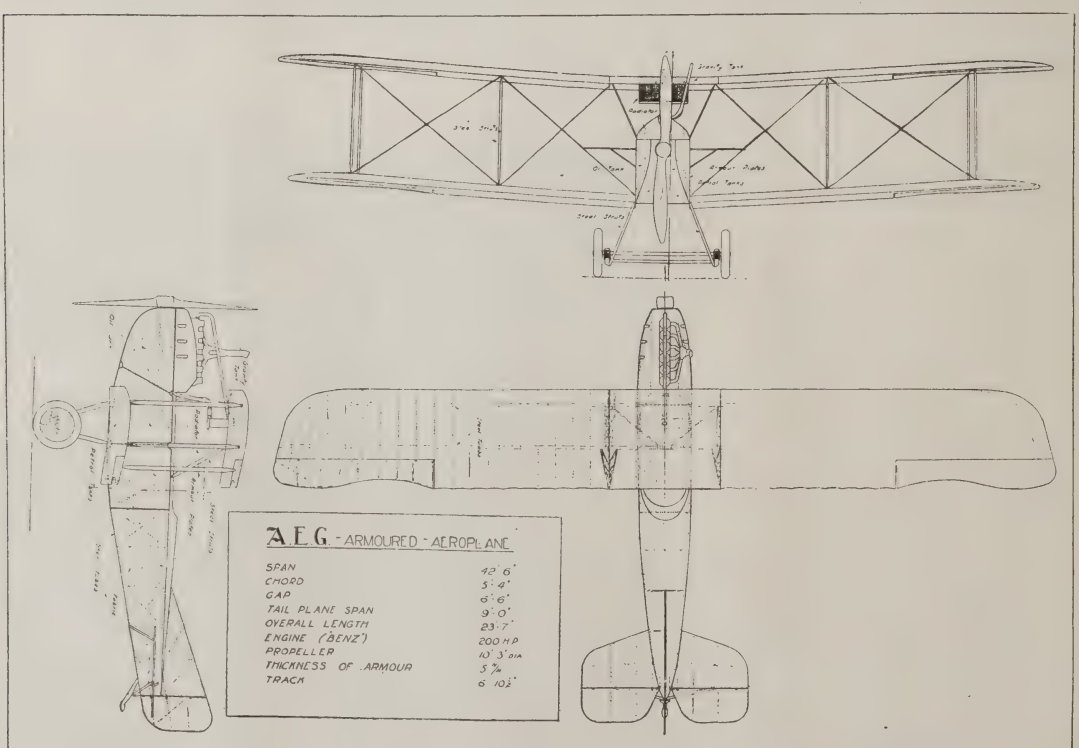
A steel tubular construction is used practically throughout. The machine was badly crashed, and some details are, therefore, not available; but the General Arrangement Drawings at the end of this report may be regarded as substantially accurate.

The leading particulars of the macchine are as follows:

Area of upper wings	190.4 sq. ft.
Area of lower wings	168 sq. ft.
Total area of wings	358.4 sq. ft.
Area of upper aileron	11.2 sq. ft.
Area of lower aileron	10 sq. ft.
Area of tail plane	9.4 sq. ft.
Area of fin	7.6 sq. ft.
Area of rudder	6 sq. ft.
Horizontal area of body	48.6 sq. ft.
Side area of body	54.8 sq. ft.
Cross sectional area of body	14.4 sq. ft.
Area of side armor	33 sq. ft.
Area of bottom armor	29.4 sq. ft.
Area of armor bulkhead	10.4 sq. ft.
Engine, 200 h.p. "Benz."	
Crew—pilot and gunner	360 lbs.
Armament—three guns.	
Petrol capacity	38 gallons
Oil capacity	3 gallons

The manner in which the wings are constructed is exactly as shown in the report of the A. E. G. Bomber—i. e., the spars consist of two steel tubes 40 mm. in diameter by 0.75 mm. thick. At their ends the upper and lower surfaces of the spares are chamfered away, and flat plates welded in position, so as to provide a taper within the washed-out portions of the wing tips. The wings were, unfortunately, so badly damaged that no accurate drawing of their section can be taken, but there is evidence that this very closely follows the section of the bomber, which has already been published. The ribs are of wood, and between each main rim is placed a half-rib joining the front spar to the semi-circular section wooden strip which forms the leading edge. The wing construction is strengthened by two light steel tubes passing through the ribs close behind and parallel to the leading spar, which are used for housing the aileron control wires. The bracing against drag consists of wires and transverse steel tubes welded in position. At the inner end of the wings special reinforced ribs of light gauge steel tube are provided. The spars are attached to the fuselage by plain pin joints.

The centre section of the upper surface is constructed in a similar manner to that of the wings, except that it is considerably reinforced, and the spars are larger in diameter. The leading spar has a diameter of 51 mm. and the rear spar 45 mm. The centre section is secured to the fuselage by a system of stream-lined steel struts, the feet of which terminate in ballends dropped into sockets, and there bolted in position.



The centre section contains an auxiliary gravity petrol tank, and also the radiator, and is, therefore, substantially braced with steel tube transverse members.

The wings are set with a dihedral angle of approximately 6 deg.

The aileron framework is of light steel tube throughout, the tube forming the trailing edge being flattened into an eliptical section. The ribs are fixed by welding. The framework of the ailerons on the upper wing is reinforced by diagonal bracing of light tube.

These are of light steel tube streamline in section, tapered at each end, and terminating in a socket which abuts against a ball-headed pedestal carried on the wing spars; through the socket and the ball is passed a small bolt. The manner in which this attachment is carried out is exactly similar to that described in the report on the A. E. G. Bomber.

The whole of the fuselage is built up of steel tubes welded together, and having affixed at their junctions sheet steel lugs, which serve as the anchorage for the bracing wires. The diameter of the longerons and of the frame verticals is 20 mm., except the last three members adjacent to the tail, of which the diameter is 16 mm. The welding throughout the fuselage appears to be of very high quality. In Fig. 2 is illustrated a joint, which occurs in the fuselage immediately in front of the pilot's cockpit. The longeron is, from this point to the rear of the gunner's cockpit, fitted with a wooden strip taped in position. This joint shows the method in which the cross bracing wires are furnished with an anchorage. In one or two points in the frame con-

struction the bracing wire lies in the same plane as the transverse tube, and to allow for this a diagonal hole is drilled through the tube, and filled in with a small steel tube welded in place.

This consists of a triangulated arrangement of steel tubes carrying hollow rectangular section steel bearers, on which the crank chamber is slung. The bearers are well trussed both in the vertical and horizontal planes, and are shown in dotted lines in the General Arrangement Drawings. The engine bearers themselves are 2 mm. in thickness, and have an approximate sections of 2 1/16 ins. by 1½ in.

The empennage possesses no particular points of interest, the planes having the usual tubular framework. The tail plane is not fitted with any trimming gear, but a method of adjustment is provided. This is shown in Fig. 3, which is self-explanatory. The diagonal struts which proceed from the base of the fuselage to the tail plane spar are fitted at each end with a method of adjustment shown in Fig. 4, allowing them to be extended as required according to the particular socket which is used to carry the leading edge of the tail plane. Neither the elevators nor the rudder are balanced. The rudder post is mounted on the end of the fuselage, as shown in Fig. 5, in which it will be seen that the vertical frame tube of the fin is very stoutly attached to the frame by a triangulated foot.

THE HANNOVERANER BIPLANE

THE Technical Division of the British Air Ministry have issued the following report on the Hannoveraner biplane:

This machine was brought down by anti-aircraft fire near Lestrem, on March 29, 1918. As will be seen from the photographs, it is of highly characteristic design, and possesses numerous features of interest.

On labels protected by celluloid, and on the upper surfaces of the wings and fuselage, are identification marks with the date 15/2/18, showing that this machine is of recent construction.

Generally speaking, the construction is of wood throughout, steel being used sparingly, except in the interplane struts, landing chassis struts, centre section and some details of the tail.

Judged by contemporary British standards of design, the Hannoveraner biplane reaches a fairly high level, the construction throughout being sound, and the finish quite good.

The performance of the machine is not by any means bad.

The leading particulars of the machine are as follows:—

Weight Empty, 1,732 lbs.
Total Weight, 2,572 lbs.
Area of Upper Wings, 217.6 sq. ft.
Area of Lower Wings, 142.4 sq. ft.
Total Area of Wings, 360.0 sq. ft.
Loading per sq. ft. of Wing Surface, 7.29 lbs.
Area of Aileron, each, 16.4 sq. ft.
Area of Balance of Aileron, 1.6 sq. ft.
Area of Top Plane or Tail, 10.0 sq. ft.
Area of Bottom Plane of Tail, 19.2 sq. ft.
Total Area of Tail Plane, 29.2 sq. ft.
Area of Fin, 6.5 sq. ft. approx.
Area of Rudder, 6.4 sq. ft.
Area of Elevators, 22.0 sq. ft.
Horizontal Area of Body, 53.2 sq. ft.
Vertical Area of Body, 91.6 sq. ft.
Total Weight per h.p., 14.3 lbs. per h.p.
Crew, Pilot and Observer.
Armament, 1 Spandau firing through propeller.
1 Parabellum on ring mounting.
Engine, Opel Argus, 180 h.p.
Petrol Capacity, 37¼ gallons.
Oil Capacity, 3 gallons.

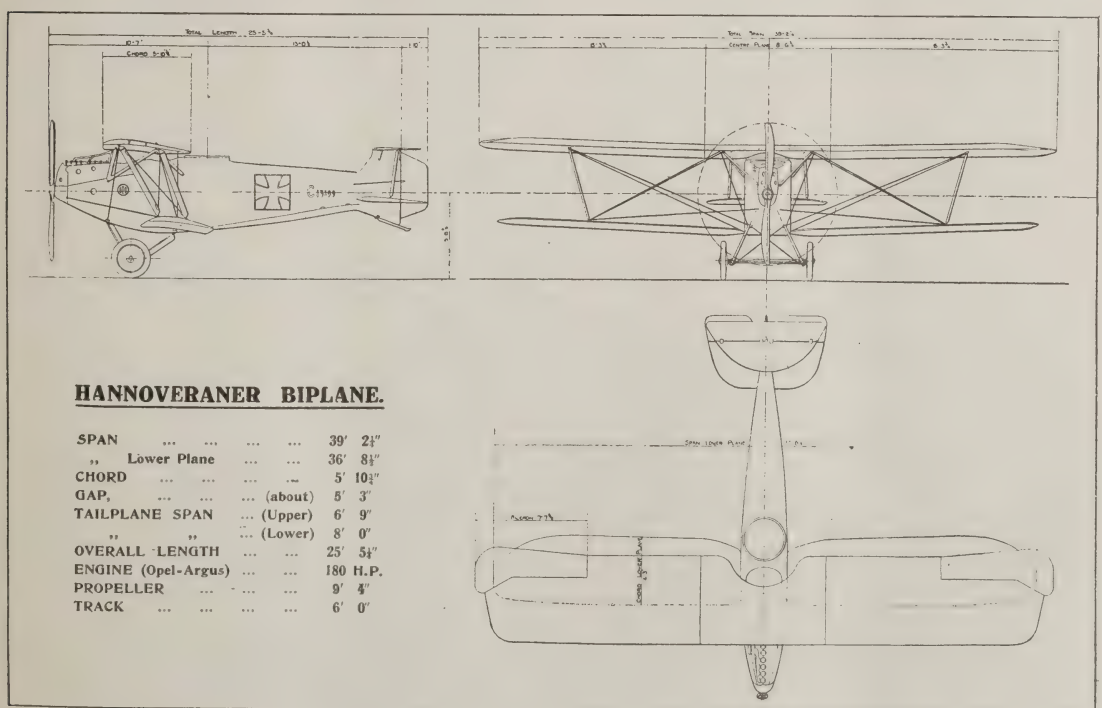
PERFORMANCE.

(a) Climb to 5,000 feet, 7 mins.
Rate of climb in ft. per min, 590.
Indicated air speed, 68.
Revolutions of Engine, 1,495.
(b) Climb to 10,000 ft., 18 mins.
Rate of climb in ft. per min., 340.
Indicated air speed, 65.
Revolutions of Engine, 1,475.
(c) Climb to 13,000 ft., 29 mins., 45 secs.
Rate of climb in ft. per min., 190.
Indicated air speed, 62.
Revolutions of Engine, 1,445.

SPEED.

At 10,000 ft. 96 miles an hour; Revolutions, 1,565.
At 13,000 89½ miles an hour; Revolutions, 1,520.
Service ceiling at which rate of climb is 100 ft. per min., 15,000.
Estimated absolute ceiling, 16,500.
Greatest height reached, 14,400 in 39 mins. 10 secs.
Rate of climb at this height, 120 ft. per min.
Air endurance, about 2½ hours at full speed at 10,000 ft., including climb to this height.
Military load, 545 lbs.

The machine is nose-heavy with the engine off, and slightly tail-heavy with the engine on. It tends to turn to the left with the engine on.



The machine is generally light on controls, except that the elevator seems rather insufficient at slow speeds. It is not very tiring to fly, and pulls up very quickly on landing.

The view is particularly good for both pilot and observer. The former sits with his eyes on a level with the top plane, and also enjoys a good view below him on account of the narrow chord of the lower plane.

The general arrangement of the Hannoveraner wings is somewhat reminiscent of the R.E.8 except, of course, that the bottom planes have no ailerons. The upper wings are practically flat in end elevation, but the lower have pronounced dihedral angles of 2.7 deg., and are set with a positive stagger of 2 ft. 7½ ins. The chord of the upper plane is 5 ft. 10¾ ins., and that of the lower plane 4 ft. 3 ins. In flying position, therefor, the trailing edge of the lower plane is slightly in advance of that of the upper plane. The angles of incidence marked on the manufacturer's rigging diagram, which is fixed to the side of the fuselage, and stamped on the fabric of the wing, are as follows:—

Lower Wings	5½ deg. at fuselage.
	5 deg. at struts.
Top Wings	5 deg. throughout.

The lower wings are carried direct from the bottom edge of the fuselage, the roots of the upper planes being carried on a rigidly constructed centre section, which embraces the radiator and the gravity feed petrol tank. The rearward portion of the centre section is cut away immediately over the pilot's seat, and at this point the wing is about 1 ft. above the upper surface of the fuselage. The lower plane has no very pronounced wash-out, but this feature is more noticeable in the upper plane, and is enhanced by the design of the ailerons, the tips of which are set at a slightly negative angle. This gives the characteristic German appearance to the aeroplane when seen in flight.

TEST OF 300 H. P. MERCEDES ENGINE

(April 5, 1918)

Calibration and Endurance Tests

The Maybach engine (No. 1261) after several slight repairs had been carried out to the cylinders and propeller hub flange and coupling, was erected on a test bed, coupled to a Heenan and Froude dynamometer, and submitted to the following power and consumption tes.s, including a one hour's duration test at normal speed. The results of the calibration tests are as follows:

R. P. M.	1,200	1,300	1,400	1,500
B. H. P.	258	279	294.5	304.5
Brake, M. E. P.	120.5	120.3	118	113.9
Petrol consumption in pints, B. H. P. hour	.53	.52	.526	.545

One Hour Test

At the conclusion of the above tests a run of one hour's duration at normal revolutions (1,400 r.p.m) was carried out with the following results:

Average B.H.P.	290.
Petrol consumption	20 gallons = .55 pint per B.H.P. hour
Oil consumption	11 pints = .038 pint per B.H.P. hour
Oil pressure	5 lbs./sq. in.
Oil temperature	67° C.
Water temperature (inlet)	57° C.
Water temperature (outlet)	68° C.

Valve Timing During Tests

Inlet.	Exhaust.
O. 8°E.	O. 33°E.
C. 35°L.	C. 7°L.
Magneto advance	38°E.

Running was steady at all speeds between 900 and 1,400 r.p.m., but owing to the fact that the propeller hub flange on the crankshaft was damaged, and was running slightly out of truth, the vibration became excessive above 1,400 r.p.m.

Considerable trouble was experienced with the water connection between the cylinders on the exhaust side. The running became unsteady below 900 r.p.m.

Distribution

Owing to the exhaust manifold being fitted as part of the engine starting gear, it was not possible to form an idea of the distribution.

F. G. C. Ap.D. (L.).
May, 1918.

J. G. Weir,
Lieutenant-Colonel,
Controller, Technical Department.

General Data

Make of engine and rated h.p.	Maybach 300 h.p.
Type number	1261.
Number and arrangement of cylinders	Six vertical.
Bore	165.0 mm. = 6.50 in.
Stroke	180.0 = 7.09 in.
Stroke/bore ratio	1.09 : 1.
Area of one piston	213.825 sq. cm. = 33.2 sq. in.
Total piston area of engine	1282.95 sq. cm. = 199.2 sq. in.
Swept volume of one cylinder	3848.85 cu. cm. = 235.3 cu. in.
Total swept volume of engine	23093.1 cu. cm. = 1412.0 cu. in.
Clearance volume of one cylinder	778.9 cu. cm. = 47.54 cu. in.
Compression ratio	5.95 : 1.
Normal b.h.p. and speed	294.0 b.h.p. at 1,400 r.p.m.
Maxium b.h.p. and sped	304.5 b.h.p. at 1,500 r.p.m.
Normal b.m.e.p.	117.7 lbs. per sq. in. at 1,400 r.p.m.
Maximum b.m.e.p.	120.5 lbs. per sq. in. at 1,200 r.p.m.
Piston speed	1654.0 ft. per min. at 1,400 r.p.m.
Mechanical efficiency (calculated)	86.0%.
Indicated mean pressure (calculated)	137.0 lbs. sq. in.
Fuel consumption per b.h.p. hour	0.526 pint = 0.473 lbs.
Brake thermal efficiency	28.9%.
Indicated thermal efficiency	33.6%.
Air standard efficiency	51.0%.
Relative efficiency	65.9%.
Cu. in, of swept volume, per b.h.p.	4.80 c. in.
Sq. in. of piston area per b.h.p.	0.678 sq. in.
H.p. per cu. ft. of swept volume	360.0 b.h.p.
H.p. per sq. ft. of piston area	212.4 b.h.p.
Direction of rotation of crankshaft.	Anti-clockwise (facing propeller)
Direction of rotation of propeller	Anti-clockwise (facing propeller)
Type of valve gear	overhead valve rocker and push rods.
Type of starting gear	Maybach of special design.
Number of carburettors	Two Maybach.
Bore of main jets	Variable from 0.0 to 2.5 mm.
Bore of pilot jets	Variable from 0.0 to 1.1 mm.
Fuel consumption per hour	19.33 gallons.

Valve Areas and Gas Velocities

Diameters	
Induction pipe	62.0 mm. = 2.44 in.
Inlet port	45 × 67 mm. = 1.77 × 2.64 in.
Exhaust port	45 × 67 mm. = 1.77 × 2.64 in.
Exhaust branch pipes	66.0 mm. = 2.60 in. (approx.).
Cross Sectional Areas.	
Induction pipe	29.26 sq. cm. = 4.67 sq. in.
Inlet port	30.15 sq. cm. = 4.67 sq. in.
Inlet valve (π dh.)	4.416 sq. in. (total).
Exhaust valve (π dh.)	4.366 sq. in. (total).
Exhaust port	30.15 sq. cm. = 4.67 sq. in.
Exhaust branch pipes	34.11 sq. cm. = 5.31 sq. in.
Gas Velocities.	
Induction pipe	196.1 ft. per sec.
Inlet port	196.1 ft. per sec.
Inlet valve	208.0 ft. per sec.
Exhaust value	210.0 ft. per sec.
Exhaust port	196.1 ft. per sec.
Exhaust branch pipes	172.5 ft. per sec.

(INLET VALVES (Two per cylinder).

Outside diameter	54.0 mm. = 2.126 in.
Port diameter (in cylinder head)	48.0 mm. = 1.89 in.
Width of seating	3.5 mm. = 0.137 in.
Angle of seating	30°
Radius under valve head	20.0 mm. = 0.787 in.
Lift of valve	9.45 mm. = 0.372 in.
Diameter of stem	11.0 mm. = 0.433 in.
Over-all length of valve	136.5 mm. = 5.373 in.
Number of springs per valve	One.
Free length of spring	52.5 mm. = 2.066 in.
Length of spring in position (no lift)	39.5 mm. = 1.55 in.
Mean diameter of coils	51.0 mm. = 2.00 in.

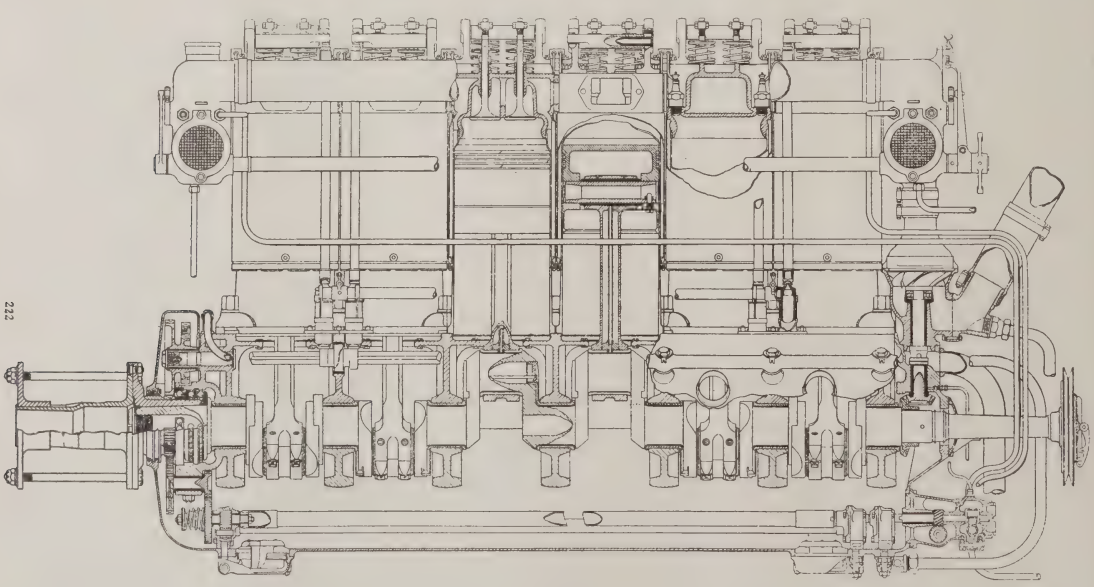

FIG. 49
GENERAL SECTIONAL ARRANGEMENT OF THE 300 h.p. MAYBACH ENGINE

Gauge of wire	No. 6 b.w.g.
Ratio length of spring/lift of valve	4.17 : 1.
Weight of valve complete with spring	0.843 lb.
Weight of spring bare	0.281 lb.
Inlet valve opens, deg. on crank	8° early.
Inlet valve closes, deg. on crank	35° late.
Period of induction	223°
Inlet tappet clearance	0.3 mm. = 0.012 in.

Connecting Rod

Length between centres	310.0 mm. = 12.205 in.
Ratio. Connecting rod/crank throw	3.44 : 1.
Little end bearing type	Floating cast-iron bush.
Floating bush, diameter, inside	38.0 mm. = 1.496 in.
Floating bush, diameter, outside	44.3 mm. = 1.743 in.
Floating bush, effective length inside	93.0 mm. = 3.661 in.
Floating bush, projected area of bearing on gudgeon pin	35.35 sq. cm. = 5.48 sq. in.
Ratio. Piston area/projected area of little end bearing	6.06 : 1.
Big end bearing. Type	Bronze shell lined white metal.
Big end bearing. Diameter	66.0 mm. = 2.598 in.
Big end bearing. Length (actual)	73.56 mm. = 2.893 in.
Big end bearing. Length (effective)	65.5 mm. = 2.580 in.
Big end bearing. Projected area	43.23 sq. cm. = 6.700 sq. in.
Ratio. Piston area/projected area of big end bearing	4.96 : 1.
Number of big end bolts	Four.
Full diameter of bolts	14.0 mm. = 0.551 in.
Diameter at bottom of threads	12.0 mm. = 0.472 in.
Total cross sectional area, bottom of threads	4.520 sq. cm. = 0.70 sq. in.
Pitch of threads	1.5 mm.
Total load on bolts at 1,400 r.p.m.	5,824 lbs.
Total load on bolts at 1,600 r.p.m.	7,602 lbs.
Stress per sq. in. at 1,400 r.p.m.	8,320 lbs. sq. in.
Stress per sq. in. at 1,600 r.p.m.	10,860 lbs. sq. in.

Crankshaft

Number and type of main bearings	Seven bronze shell lined white metal.
Cylinder centres	187.0 mm = 7.362 in.
Crank-pins.	
Outside diameter	66.00 mm. = 2.598 in.
Inside diameter	38.0 mm. = 1.496 in.
Length	74.0 mm. = 2.913 in.
Journals.	
Outside diameter	66.0 mm. = 2.598 in.
Inside diameter	36.0 mm. = 1.417 in.
Length, propeller end	67.0 mm. = 2.638 in.
Length, rear end	67.0 mm. = 2.638 in.
Length, centre	67.0 mm. = 2.638 in.
Length, intermediate	67.0 mm. = 2.638 in.
Crank Webs.	
Width	95.0 mm. = 3.740 in.
Thickness	23.0 mm. = 0.906 in.
Radius at ends of journals and crank-pins	4.5 mm. = 0.171 in.
Weight of complete shaft	99.9 lbs.

Working Clearances

Piston clearance, top (total)	0.75 mm. = 0.029 in.
Piston clearance, bottom (total)	0.25 mm. = 0.009 in.
Side clearance of connecting rod in piston (total)	11.8 mm. = 0.464 in.
Side clearance of big end on crank-pin (total)	0.44 mm. = 0.0173 in.
End clearance of crankshaft in main bearings	3.0 mm. = 0.118 in.
Clearance of valve stem in guide (inlet)	0.12 mm.= 0.00472 in.
Clearance of valve stem in guide (exhaust)	0.15 mm.= 0.0059 in.

Lubrication System

Number and type of oil pumps	Three, rotary gear.
Oil consumption per hour	11.0 pints.
Oil consumption per b.h.p. hour	0.037 pints.
Oil temperature	65° Centigrade.
Oil pressure	5.0 lbs. per sq. in.
Specific gravity of oil	0.899 s.p.g.
Ratio. Pump speed/crankshaft speed	1 : 2.
Pump delivery (calculated at 100% volumetric efficiency)	91 gallons per hour at normal engine revs.

Ignition

Number and type of magnetos	Two Bosch.
Firing sequence of engine	1-5-3-6-2-4.
Ignition timing (fully advanced)	38° early.
Number of plugs per cylinder	Two.
Type of plugs	Bosch 3 point.
Ratio. Magneto speed/engine speed	1.5 : 1.

Cooling System

Number and type of water pumps	One centrifugal.
Diameter of inlet pipe	54.0 mm. = 2.126 in.
Diameter of outlet pipe	50.0 mm. = 1.966 in.
Diameter of rotor	111.0 mm. = 4.36 in.
Water capacity of one cylinder	1284.0 cu. cm.
Number and type of radiators	One, semi-circular honeycomb.
Ratio. Water pump speed/engine speed	2 : 1.
Water temperature, inlet	57° Centigrade.
Water temperature, outlet	68° Centigrade.

Petrol Pump

Number and type of petrol pumps	One Maybach, double acting.
Bore	15.0 mm. = 0.59 in.
Stroke	17 mm. = 0.66 in.
Normal delivery	264 pints per hour at 800 r.p.m.
Maximum delivery	630 pints per hour at 1,275 r.p.m.
Ratio. Pump speed/crankshaft speed	1 : 2.

Weights

Weight of complete engine, dry, with propeller boss and exhaust manifold	911 lbs.
Weight per b.h.p., ditto	3.10 lbs.
Weight of fuel per hour	139 lbs.
Weight of oil per hour (s.p.g. 0.899)	12.36 lbs.
Total weight of fuel and oil per hour	151.36 lbs.
Gross weight of engine in running order, less fuel and oil (cooling system at 0.65 lbs. per b.h.p.)	1102.0 lbs.
Weight per b.h.p., ditto	3.79 lbs.
Gross weight of engine in running order, with fuel and oil for six hours (tankage at 10% weight of fuel and oil)	2100.9 lbs.
Weight per b.h.p., ditto	7.14 lbs.

General Analysis of Weights

Description of Part	No. per set	Average unit in lbs.	Weight of complete set in lbs.	Percentage of total weight

CAPTAIN SCHROEDER ESTABLISHES WORLD ALTITUDE RECORD

THE Contest Committee of the Aero Club of America has homologated the world's altitude record made by Captain R. W. Schroeder, in a Bristol fighter equipped with 300 H. P. Hispano-Suiza motor, of 28,900 feet above sea level, during a flight on September 18, 1918, at Wilbur Wright Field, Fairfield, Ohio, near Dayton.

Nothing was more fitting. While the Allies' aviators overseas are beating the Germans on the various fronts, an American aviator, Captain R. W. Schroeder, U. S. Air Service, beats the German aeroplane altitude record.

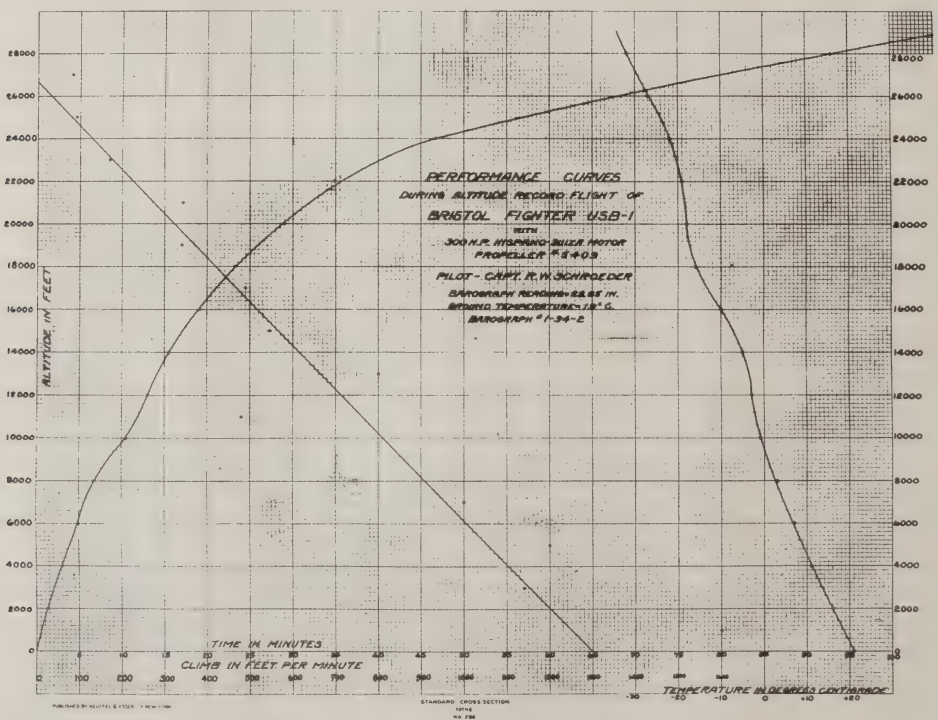
Captain Schroeder left the ground at 1:45 P. M., September 18, 1918, and reached his highest point in 105 minutes, which would have been at about 3:30 P. M. It took him about twenty minutes to descend, landing about 200 miles from where he started, at about 3:50 P. M.

Captain Schroeder is in charge of all Performance Tests at the Wilbur Wright Station and his duties require him to go to 21,000 and 22,000 feet quite often, and he generally goes without oxygen. In this record climb, he got along well up to 25,000 feet without oxygen. He used no anti-freezing mixture and his maximum water temperature was 85 degrees centigrade at the start minimum and of 60 degrees centigrade at the highest altitude. The temperature of the air was 32 degrees centigrade below zero.

The reports, including the two barograph charts, duly calibrated and corrected; the performance curves, and the temperature record were certified to by Lieut. George B. Patterson, O. I. C. Performance Tests Reports and the instruments were calibrated by the Bureau of Standards, and adjusted locally at the McCook Field Laboratory and personally installed on the aeroplane by Lieut. Patterson.

The previous American altitude record was made by Caleb Bragg at Mineola, L. I., September 20, 1917, in a Wright Martin, Model V machine, when he reached the altitude of 20,250 feet, and the last world's record of the International Aeronautic Federation made by G. Legagneux in France on the 28th of December, 1913, was 6,120 meters (20,258 feet). In July, 1914, a German aviator was reported as having flown to 26,200 feet, but the record was never submitted for homologation.

This world's record, made by Captain Ruddy W. Schroeder, is the first world's aeroplane altitude record held by an American since the world's altitude record made by Lincoln Beachey, at Chicago, Ill., during the International Meet, August 20, 1911, when he reached the height of 11,642 feet (3,548 meters).



Under the rules of the International Aeronautic Federation, the international aeronautic body which controls all aeronautic sports and gives the necessary official recognition to records, a pilot must hold the International Aviator's certificate to have his record recognized. This certificate is issued in the United States by the Aero Club of America, which is the Federation's sole representative in this country. Captain Schroeder held the F. A. I. certificate at the time he made the record, therefore his record will be accepted by all the countries affiliated with the International Aeronautic Federation and the Pan-American Aeronautic Federation, which represents the twenty Latin-American republics.

Under the rules of the Federation to establish an altitude record it is necessary to beat the old record by at least 100 meters. Captain Schroeder, therefore, beat the record by a good margin and has gone higher than the highest of mountains, with the exception of the highest peak of the Himalaya, which rises to 29,002 feet.

Captain Schroeder is a veteran in the aeronautic movement. He is an old time member of the Aero Club of Illinois and well known for his ability as an aviator and aeronautic engineer.

Capt. R. W. Schroeder who made the new altitude record

Aero Mail Scores 100% for September

The record of the Air Mail Service between Washington, Philadelphia and New York for the month of September was 100% perfect.

The operation of the aeroplanes, constructed for the Post Office Department, by civilian pilots of the postal service was inaugurated August 12. The record of all the flights from this date to the first of September, except two, was 100% perfect, the score of two flights being reduced to 99% by reason of forced landings.

The September report covers the first full month of operation under entirely civilian organization, and the round trip flight was made each day without a break in the service. The distance covered by these flights was 11,351 miles; the total time consumed 156 hours and 9 minutes, and the total weight of mail carried was 15,199 lbs.

During the month there were but three forced landings and these were not such as to interrupt the flights.

AERIAL MAIL OPERATION FOR THE MONTH OF SEPTEMBER, 1918

Date	*Miles flown*	*Hrs. of flying*		*Mail carried*		*Percent of Performance*	*Arrival*	
		hrs.	*min.*	*A.*	*O.*		*Wash.*	*N. Y.*

Total	11,351	156	09	874¾	14,325			

NOTE—Number of hours of dead flying for the month, 14 hrs., 40 min.

Explanation of Tabulation:

1. *Miles flown:*
   Leg from Washington to Philadelphia.... 128 miles
   Leg from Philadelphia to New York..... 90 miles
   Miles flown for the day; whether one,two, three or four legs of the trip have been made. The aim is to get exactly the number of miles flown in connection with the mail service each day. Therefore, mileage of partial trips should be indicated.
2. *Hours of flying:* To include the actual hours and minutes machine is in the air with mail.
3. *Mail carried:* In this column, under A, give pounds of aeroplane mail; and under O, give pounds of ordinary mail.
4. *Percent of Performance:* Round trip Washington-New York consists of four legs, each leg valued at 25% if completed by aeroplane and not by train before close of day.

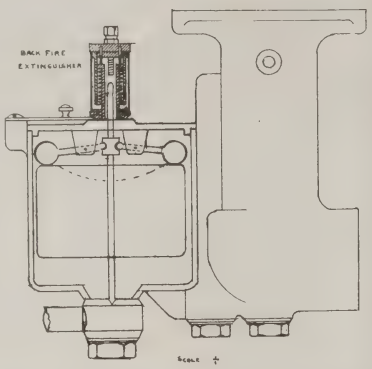
PERFORMANCE OF AVIATORS DURING THE MONTH OF SEPTEMBER, 1918.

Total possible number of flights	100
Total possilbe mileage	10,900
Total perfect (uninterrupted) flights made	97
Total interrupted flights made	3
Total flights defaulted on account of weather	0

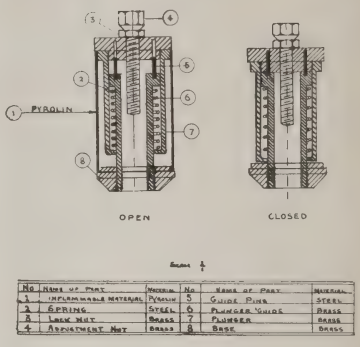
Pilot	*Perfect Flights*		*Forced Landings Interrupted Flights*	*Uncompleted Flights*	*Total Flights*	
	No.	*Miles*			*No*	*Miles*
Dana C. DeHart	32	4388	2 (a)	0	34	3706
Robert F. Shank	33	3616	1 (b)	0	34	3706
Maurice A. Newton	30	3270	0	0	30	3270
Max Miller	2	218	0	0	2	218
Total	97	10,592	3	0	100	10,900

Cause of Forced Landings:

(a) DeHart, September 18th, compass disturbances in storm; September 21st, ignition trouble.

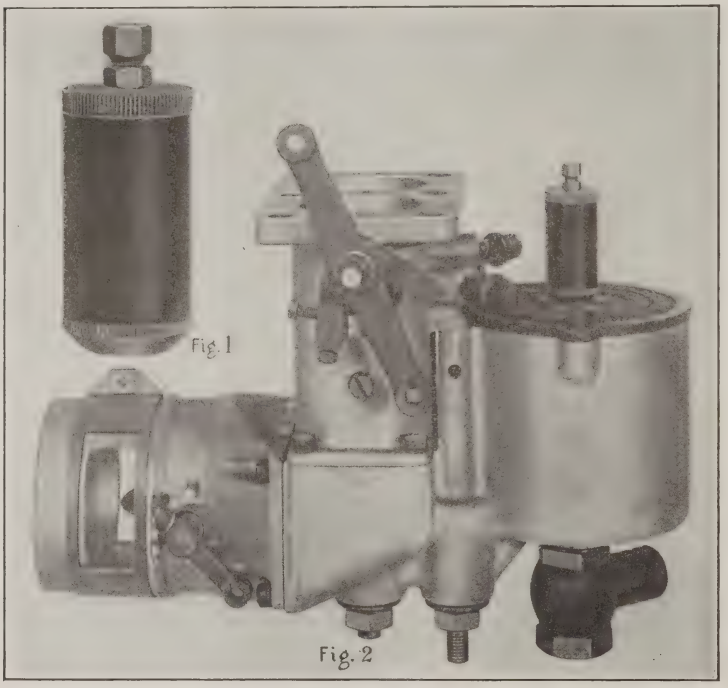


(b) Shank, September 24th, water-system trouble.



A BACK-FIRE EXTINGUISHER

MR. HAROLD SUCKERT, a well-known carburetor expert and engineer, has designed the Back-fire Extinguisher shown in the accompanying sketches and plates.



While it is not claimed that it will prevent back fires, which are unavoidable, it is claimed and has been demonstrated, that this simple device will shut off the gasoline from the tank, the moment a back fire sets fire to the carburetor, thus making possible the prevention of serious accidents. The device can be attached to any type of carburetor, either on aeroplanes, automobiles or motor boats, its action is as follows:

It is screwed on the top of the carburetor float chamber, directly over the intake needle valve, which extends up into the body of the device, within an eighth of an inch of the bottom of the adjustable rod No. 4, which is carried by the plunger No. 7. The spring No. 2, which is under compression, surrounds the plunger guide No. 6, which screws onto the top of the carburetor float chamber. This spring is kept under compression by a highly inflammable perforated collar of Pyrolin, which flashes instantly on coming into contact with any flame. This immediately releases the tension on the spring, which causes the plunger No. 7 to seat on the base No. 8, thus forcing the intake needle valve firmly against its seat, shutting off all flow of gasoline from the tank.

No.	Name of Part	Material	No.	Name of Part	Material
1	Inflammable Material	Pyralin	5	Guide Pins	Steel
2	Spring	Steel	6	Plunger Guide	Brass
3	Lock Nut	Brass	7	Plunger	Brass
4	Adjustment Nut	Brass	8	Base	Brass

It is a well-known fact that any contingency which causes the motor to race, such as a broken propeller blade or particularly rarified strata of air, draws the fuel out of the float chamber faster than it can be supplied. This invariably causes a back fire, due to too thin a mixture. When this occurs, the float is usually down, and the gas line fully open. The gasoline under pressure is forced into the flame, and this usually spells disaster.

The Back-fire Extinguisher does automatically what the operator is supposed to do manually, shuts off the supply from the tank.

This does not necessarily put the engine out of commission as there is a connection to the dash board which permits the driver to immediately raise the device to its original position, and continue his flight.

A supply of Pyrolin collars is furnished with each device. The Back-fire Extinguisher is controlled by W. H. de Fontaine of 1697 Broadway, New York, formerly President of the H and N Carburetor Company, who has offered it to the United States Government and her Allies.

THIRD ANNUAL REPORT OF THE NATIONAL ADVISORY COMMITTEE ON AERONAUTICS

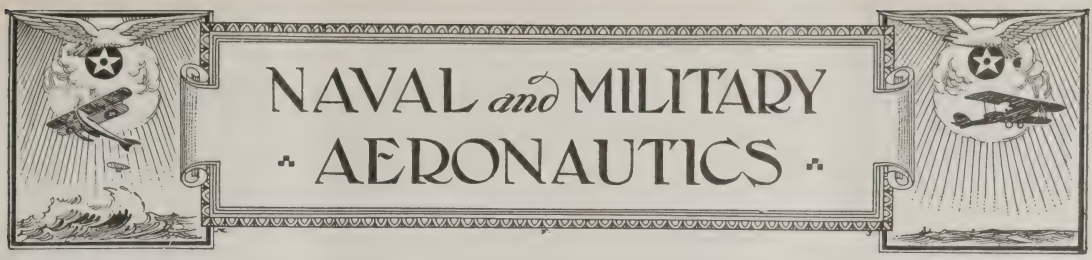
Physical Problems

(*Concluded from page* 175)

BESIDE the more general problems, the following problems of a physical, rather than an aeronautical nature, are of particular interest, and under same the following progress is noted:

A. *Noncorrosive materials.*—For the production of iron and steel, investigations of zinc coatings produced by the hot dip, sherardizing, and electroplating processes have been carried on at the Bureau of Standards. Investigations are under way to determine the relative resistance to corrosion by these processes and also the effect on the physical properties of steel as influenced by such processes. Various methods of testing these products as by accelerated tests, such as the salt-spray test, measurements of thickness and quantity of coating are being studied to develop adequate specifications for these materials.

Some work has also been done in connection with the following additional rust-proof processes: Copper and nickel plating; Parker process (which consists in treating with phosphoric acid and final oiling); the magnetic oxide coating such as Bon Tempi process, which may or may not be oiled; lead coating as produced by the Lohman hot-dip process; tin coating; metallic coatings produced by the metal-spraying process; inert coating, such as paint, japan, and baked enamels.



The great variation in thickness and weight of the metallic coatings produced under commercial conditions are such as to make it difficult if not impossible to determine their value by these measurements alone. Some standard accelerated corrosion tests are therefore necessary before uniformly protected coatings can be specified.

B. *Flat and cambered surfaces.*—The committee has obtained reports of several tests conducted at the National Physical Laboratory of Great Britain, which contain valuable information on stabilizers, elevators, and rudders.

Accurate data can be obtained from Report No. 17, previously referred to, as to variations to be made in tail surfaces, viz: size; position, both longitudinal and vertical; angles of tail plane to wing; aspect ratio; and sections, flat and cambered.

C. *Terminal connections.*— Tests have been made on two forms of terminal connection, one a sleeve allowing the forming of a solderless loop and the other a turnbuckle by means of which a cable or wire may be loosened without unscrewing the turnbuckle barrel. The tests thus far are not

(*Continued on page* 239)

Key to Abbreviations

AAD—Assigned to active duty.
ABC—Report to Army Balloon School, Arcadia, Cal.
ADO—Report to Aviation Supply Depot, Dayton, Ohio.
ADT—Report to Aviation Supply Depot, Dallas, Texas.
AFO—Report to Aviation Supply Depot, Fairfield, O.
AGC—Report to Aviation Supply Depot, Garden City, L. I., N. Y.
AHT—Report to Aerial Gunnery School, Houston, Texas.
AIR—Transferred to the Air Service, National Army, without change in rank or date of commission.
ALF—Report to Camp Alfred Vail, Little Silver, N. J.
AMV—Report to Aviation General Supply Depot, Morrison, Va.
AOV—Report to School for Aerial Observers, Hampton, Va.
APR—Report to School of Aerial Photography, Rochester, N. Y.
ARV—Report to Aviation Supply Depot, Richmond, Va.
ASM—Report to Aviation Mechanics' Training School, St. Paul, Minn.
BFT—Report to Barron Field, Fort Worth, Texas.
BRN—Report to Bakers Field, Rochester, N. Y.
BST—Report to Brooks Field, San Antonio, Tex.
CAF—Report to Carlstrom Field, Arcadia, Fla.
CAP—Commissioned as Captain, Aviation Section, Signal Corps.
CDT—Report to Aviation Concentration Camp, Dallas, Texas.
CFT—Report to Carruthers Field, Fort Worth, Texas.
CGC—Report to Aviation Concentration Camp, Garden City, L. I., N. Y.
CGS—Report to Aviation Concentration Camp, Greenville, S. C.
CIT—Report to Radio School, Carnegie Institute of Technology, Pittsburgh, Pa.
CJS—Report to Camp Jackson, Columbia, S. C.
CJW—Report to Camp John Wise, San Antonio, Texas.
CLR—Commissioned as Colonel, Aviation Section, Signal Reserve Corps.
CMV—Report to Aviation Concentration Camp, Morrison, Va.
CPA—Commissioned as Captain Air Service, National Army.
CPR—Commissioned as Captain, Aviation Section, Signal Reserve Corps.
CRI—Report to Chanute Field, Rantoul, Ill.
CSO—Report to the Chief Signal Officer, Washington, D. C.
CUI—Report to School of Military Aeronautics, Cornell University, Ithaca, N. Y.
CWT—Report to Call Field, Wichita Falls, Texas
DAF—Report to Dorr Field, Arcadia, Fla.
DAP—Report to Director of Aircraft Production, Washington, D. C.
DIK—Report to Camp Dick, Dallas, Tex.
DIS—Honorably discharged from service.
DMA—Report to Director of MilitaryAeronautics, Washington, D. C.
ELA—Report to Eberts Field, Loanoke, Ark.
EOT—Report to Ellington Field, Olcott, Texas.
FLA—Commissioned as First Lieutenant Air Service, National Army.
FLR—Commissioned as First Lieutenant, Aviation Section, Signal Reserve Corps.
FLT—Commissioned as First Lieutenant, Aviation Section, Signal Corps.
FOB—Report to Fort Omaha Balloon School, Omaha, Neb.
FRF—On duty requiring regular and frequent aerial flights.
FSO—Report to Fort Sill School for Aerial Observers, Fort Sill, Okla.
GIT—Report to School of Military Aeronautics, Georgia Institute of Technology, Augusta, Ga.
GLC—Report to Gerstner Field, Lake Charles, La.
HHN—Reprt to Hazelhurst Field, Mineola, L. I., N. Y.
JMA—Rated as Junior Military Aviator.
JRC—Report to Jackson Field, Riverside, Cal.
KST—Report to Kelly Field, So. San Antonio, Tex. (When specified in the order, the number of the field is given in parentheses)
LDT—Report to Love Field, Dallas, Tex.
LHV—Report to Langley Field, Hampton, Va.
MAC—Report to March Field, Allesandro, Cal.
MAJ—Commissioned as Major, Aviation Section, Signal Corps.
MAT—Report to Mather Field, Sacramento, Cal.
MDO—Report to McCook Field, Dayton, Ohio.
MIT—Report to School of Military Aeronautics, Massachusetts Institute of Technology, Boston, Mass.
MJA—Commissioned as Major Air Service, National Army.
MJR—Commissioned as Major, Aviation Section, Signal Reserve Corps.
MSC—Report to Radio School, Maryland State Agricultural College, College Park, Md.
OBS—Attached to the Aeronautical Service as Observers.
OSU—Report to School of Military Aeronautics, Ohio State University, Columbus, Ohio.
PFO—Report to Post Field, Fort Sill, Okla.
PMT—Report to Park Field, Millington, Tenn.
PUP—Report to School of Military Aeronautics, Princeton University, Princeton, N. J.
PWM—Report to Payne Field, West Point, Miss.
REL—Relieved from present duty.
RSD—Report to Rockwell Field, San Diego, Cal.
RTR—Retransferred to organization attached to previous assignment to aviation duty.
RWT—Report to Rich Field, Waco, Tex.
SBI—Report to Scott Field, Belleville, Ill.
SAG—Report to Souther Field, Americus, Ga.
SGS—Report to Camp Sevier, Greenville, S. C.
SLA—Commissioned as Second Lieutenant Air Service, National Army.
SLR—Commissioned as Second Lieutenant, Aviation Section, Signal Reserve Corps.
SLT—Commissioned as Second Lieutenant, Aviation Section, Signal Corps.
SMM—Report to Selfridge Field, Mount Clemens, Mich.
SRC—Report to Columbia School for Radio Officers, New York City.
TFT—Report to Taliaferro Field, Fort Worth, Texas. (When specified in the order, the number of the field is given in parentheses)
TMA—Report to Taylor Field, Montgomery, Ala.
UCB—Report to School of Military Aeronautics, University of California, Berkeley, Cal.
UIU—Report to School of Military Aeronautics, University of Illinois, Urbana, Ill.
UTA—Report to School of Military Aeronautics, University of Texas, Austin, Tex.
VBW—Report to Vancouver Barracks, Washington.
WAC—Report to Aviation Concentration Camp, Waco, Tex.
WCS—Wire to the Chief Signal Officer upon arrival.
WDM—Wire, Director of Military Aeronautics, upon arrival.
WFO—Report to Wilbur Wright Field, Fairfield, Ohio.

Notes

Note 1—Report to places mentioned in order named for temporary duty.

Note 2—Report to Students' Army Training School, Univ. of Ark., Fayetteville, Ark.

Note 3—Report to Students' Army Training School, Valparaiso Unit., Valparaiso, Ind.

Note 4—Report to Students' Army Training School, Purdue Univ., Lafayette, Ind.

Note 5—Report to Students' Army Training School, Univ. of Me., Orono, Maine.

Note 6—Report to Students' Army Training School, Iowa State College, Ames, Iowa.

Note 7—Report to Students' Army Training School, Univ. of Cinn., Cincinnati, Ohio.

Note 8—Report to Students' Army Training School, Carnegie Tech., Pittsburgh, Pa.

Note 9—Report to Students' Army Training School, Boston College, Boston, Mass.

Note 10—Report to Students' Army Training School, Ind. Chamber of Commerce, Indianapolis, Ind.

Note 11—Report to Aviation Repair Depot, Indianapolis, Ind.

Note 12—Report to Dis. Mgr. Finance, Yeon Bldg., Portland, Ore.

Note 13—Report to Aviation Gen. Supply Depot, Middletown, Pa.

Note 14—Report to Acceptance Park, Detroit, Mich. Wire DAP.

Note 15—Report to Chief Technical Division, Dayton, O.

Note 16—Report to Production Dept., Saving and Trust Bldg., Dayton, O.

Note 17—Report to Dis. Mgr., 480 Lexington Ave., New York City.

Note 18—Report to Dis. Mgr., Aircraft Production, Dayton, O.

FOREIGN NEWS

GREAT BRITAIN

A report from Saloniki on Sept. 19 says: "Four of our scouts engaged fourteen enemy machines and crashed two of them to the ground. One of our machines is missing.

"Clouds and a strong wind interfered with air work on Sept. 18 and observation was carried on with difficulty. Squadrons working on the 3d and 4th Army fronts kept in close touch with the troops, reported positions of enemy batteries and delivered ammunition to machine gunners in the forward areas.

"Five and a half tons of explosives were dropped and two hostile machines were downed and two sent down out of control. None of our machines is missing. Night flying was impossible."

The British air forces have dropped sixty tons of bombs on German territory in five days. This exceeds the record for any previous for.-night.

These long distance raids have been directed chiefly against poison gas and aeroplane factories at Mannheim, the Daimler works at Stuttgart, the railway station at Frankfort and the docks and sidings at Karlsruhe. Their destructive effect is shown by photographs.

Aerial assaults over the battle area have been numerous. Acting in conjunction with the Franco-American offensive thirty-five separate raids were made between September 13 and 16 against important enemy aerodromes and vital railway junctions. Thirteen of them were against the Metz-Sablon railroad.

Altogether British airmen have dropped 120 tons of bombs upon the western battle front in the course of a week exclusive of the explosives dropped in Germany. Nineteen tons were dropped on Bruges, Ostend and other German coastal defences in air fighting, during which seventeen enemy machines were destroyed and nine disabled, while five British planes were lost. The number of German machines destroyed altogether in the week was 101, while thirty-seven were disabled. The British losses totalled fifty.

The allied independent air force dropped bombs on Sept. 20 on Mannheim, Karlsruhe, Boulay, Frescaty and Morhange, according to an official statement issued by the British Government.

Explosives were dropped on the Lanz works at Mannheim, on wharves and factories at Karlsruhe, on blast furnaces at the Burbach works and on aerodromes at Boulay, Frescaty and Morhange. One German machine was brought down. One allied machine is missing.

On the front held by Field Marshal Haig nineteen German aeroplanes have been accounted for by British airmen, while the British themselves have lost eleven machines, according to Marshal Haig's report, which says:

"Despite low clouds and frequent showers our aeroplanes carried out useful work in all departments Friday.

"Sixteen hostile machines were downed and three sent down out of control. Eleven of ours are missing.

"Twenty-six and a half tons of bombs were dropped during the twenty-four hours.

"Eleven tons of bombs were dropped on Sept. 22. Eight enemy planes were destroyed. Four of ours are missing.

"That night four tons of bombs were dropped on the Valenciennes aerodrome.

"The Greeks co-operated in the bombing of Constantinople on Sept. 20 and 21 and dropped thousands of leaflets into Stamboul.

"A balloon, shot down in flames in the European operations set fire to three hangars, which were burned out."

Machines of the British Independent Air Force dropped nearly sixteen tons of bombs on German aerodromes and on blast furnaces in the Metz region on Sept. 21, it was officially announced.

The blast furnaces attacked were those at Hagendingen and Rombach. Four enemy aerodromes were bombed by the raiders.

Fifty-three hostile aeroplanes were accounted for by British aviators on Sept. 24, acording to the official announcement. Thirty-one of these were destroyed and twenty-two were driven down. Ten British machines failed to return. More than 2,000 photographs were taken and 12½ tons of bombs dropped in twenty-four hours.

British aeroplanes dropped bombs on Sept. 25 on the German city of Frankfort, according to an official statement issued by the War Office. Five enemy machines were shot down. Four British aeroplanes are missing.

Another communication says: "On Sept. 25 ten enemy machines were brought down. In twenty-four hours we dropped thirty-five tons of bombs on aerodromes and railways."

The German aerodromes at Buhl, twenty-five miles southwest of Karlsruhe, and Kaiserslauterm, between Metz and Mannheim, have been bombed by machines of the British Independent Air Force. Fighting took place during the expedition, with the result that two enemy machines were destroyed. Three of the British machines have not been located.

British aeroplanes on September 25 dropped bombs on the German city of Frankfort, according to an official statement issued by the War Office. Five enemy machines were shot down. Four British aeroplanes are missing.

The following official communication dealing with the operations of the British independent air force was issued on September 27:

"In conjunction with the Franco-American operations Thursday our machines in the afternoon attacked the railways of Metz-Sablon and Audun-le-Roman with good results. Large numbers of enemy aeroplanes were encountered and bitter fighting took place.

"Two enemy machines were destroyed and one was sent down out of control. Six of ours failed to return.

"On the night of September 26 in heavy attacks on the Metz-Sablon region many direct hits were observed. The railways of Mezieres and Thionville and the Frescati aerodrome were attacked. There were several direct hits on the Thionville station and junction. All our machines returned."

Another communication, dealing with operations over other parts of the fighting front and behind the lines, says:

"Our machines on September 26 carried out a large number of reconnoissance flights and manoeuvres for observing the effect of our artillery fire.

"More than twenty tons of bombs were dropped on railheads and billets. In a raid on an enemy aerodrome several hangars were set on fire and a hostile machine was destroyed on the ground, and seven others which attempted to repel the attacking squadron were shot down. Four hostile machines were destroyed on other parts of the front. Five of our machines were missing during the day. Little flying was possible at night."

The British aerial communication of September 28 says:

Our machines were active on every part of the front throughout Friday that kept close watch from the air on the course of the various operations. Bombing patrols carried out at a low altitude along the battle front attacks on enemy troops and transports at the canal crossings and along the roads, and heavily engaged the enemy with machine gun fire.

Four machines, working in coöperation with the artillery, reported a great number of targets and observed the fall of the rounds. Many explosions and fires were observed in hostile battery positions. Over a thousand photographs were taken during the day.

In addition to extensive bombing just beyond the lines, several enemy aerodromes and a number of railway junctions were attacked with excellent effect. Thirty tons of bombs were dropped by us in the day and eighteen and a half tons at night.

Twenty-two German machines and eight balloons were shot down by our airmen. Twenty enemy machines were driven down out of control in the course of the air fighting. Another machine was destroyed by anti-aircraft fire. Nineteen of our machines are missing.

In the last week the British airmen have undertaken important offensive operations in no fewer than six separate theatres of war, ranging from the coast of Flanders to the fringes of the Syrian Desert.

On the northern coastal sector destructive aid raids were made upon the German submarine, naval and aircraft stations in Belgium. On the battlefront in France there was intense air fighting between La Bassée and Péronne on the St. Quentin road. On the Rhine front sixteen bombing raids were made by the R. A. F. Independent Force into Germany. On the Salonica front there was much low-height bombing and machine-gun fighting from the air on the roads to Strumnitza. The Aegean front was chosen for a double raid upon Constantinople, causing damage to the station and military buildings at Nagara and Stamboul. The Palestine front was marked by great British aerial activity, resulting in heavy destruction of enemy transport stores and war material, and heavy casualties to the retreating enemy.

Two points of unusual interest stand out in this fighting, the increasingly important part played by aerial reconnoissance in preparing the way for an offensive, and the striking power of modern aircraft to intensify the disorder in the rear of a defeated army. Thus, in Palestine, contingents of the Royal Air Force and the Australian Flying Corps have been carrying out reconnoissance upon a wide scale over the maritime plain stretching from Mount Carmel to the Shechem-Joppa road, as well as over Samaria and the Valley of the Jordon from the edge of the Judean Plateau to the Sea of Galilee. Excellent aerial photographs were taken, which proved of very great value to the British Staff. Other aerial contingents, crossing the eastern range of hills, attacked vigorously the enemy centres at Amman and Deraa, in the Hedjaz Railway.

These operations were preliminary to the offensive at the end of the week. Acting in close coöperation with the infantry and cavalry, British airmen on the night of September 18 heavily bombed the vital railway junction at El Afules, south of Nazareth, thus hindering the dispatch of reinforcements from the north and adding enormously to the difficulties of the enemy. Throughout the following day British aeroplanes bombed the enemy's headquarters and harassed his retreat by firing many thousands of rounds and dropping more than eleven tons of bombs behind his lines.

Nablus, the strategic centre of Samaria, was heavily attacked by air from the commencement of the offensive, and on September 21 and 22, as the Turkish retreat developed into a rout, British airmen inflicted very heavy casualties and enormous material damage upon the enemy in the congested mountain roads, notably on those leading to the famous Damieh Ford across the Jordan.

Scarcely less disastrous to the enemy were the operations of the British airmen on the Salonica front. Here, as in Palestine, a large number of reconnoissance and bombing raids were carried out prior to the offensive on September 18. On the morning of the 21st aeroplanes brought timely advice of the impending retirement of the enemy, extensive fires being observed at Hudova station behind the lines, while later in the day the Kosturino-Sturza road was seen to be densely packed with troops and transports, hurrying to the rear. Squadrons of British airmen continuously attacked these from a low height, causing much material destruction and many casualties.

The work of the airmen in the battle zone is described by Field Marshal Haig in his report of September 29 as follows:

"The air force coöperated in every phase of Saturday's operations. Patrols carried out flights far behind the German lines, reconnoitering roads and railroads by day and night. In spite of the clouds and rain, successful observation for the artillery was accomplished. The location of advancing troops was constantly reported to the headquarters of all formations. Enemy troops were bombed and machine-gunned from extremely low heights and heavy casualties were inflicted.

ITALY

The aerial activity was handicapped by the bad weather prevailing on the whole front during the last week, nevertheless numerous bombardments were made by our squadrons on the important deposits of the enemy. The enemy's aerial activity did not amount to anything.

Italian Headquarters publish the following summary of both the Italian and Austrian losses during the last big drive from the 20th of June until the last of July.

(from the 20th of June until the 1st of July)

Austrian machines brought down	150
Austrian balloons brought down	5
Italian machines lost	16

(During the month of July)

Austrian machines brought down	109
Austrian balloons brought down	2
Italian machines lost	4

These numbers show the great superiority of the Italian Aviation compared with the Austrian, and it is increasing each day.

The statements of the prisoners continuously confirm the terrible effects of the Italian Aviation in the bombardment work and in the machine-gun attacks on the soldiers.

Entire forces were destroyed by machine-gun fire from special armored aeroplanes at a very low altitude.

The Italian Aviators carry on with great success on the discouraged Austrian population a propaganda by means of pamphlets.

MODEL NEWS

Edited by John F. McMahon

Model Aeroplane Building as a Step to Aeronautical Engineering

When wings are finished, the struts should be made. These are made of spruce 2" x 1", 4' 10" long and corners rounded off to an oval shape. The ends of the struts are tapered to 1" square, after which they are bound by cotton tape and glued to prevent splitting when the eye-screw is inserted. This eye-screw is standard ¼" diameter and can be purchased in any hardware store. The size of the eye should be at least 5/16" and no more than ⅜" in diameter. One of these eye-screws is screwed into each end of the strut as far as it will go as shown in Figure 6.

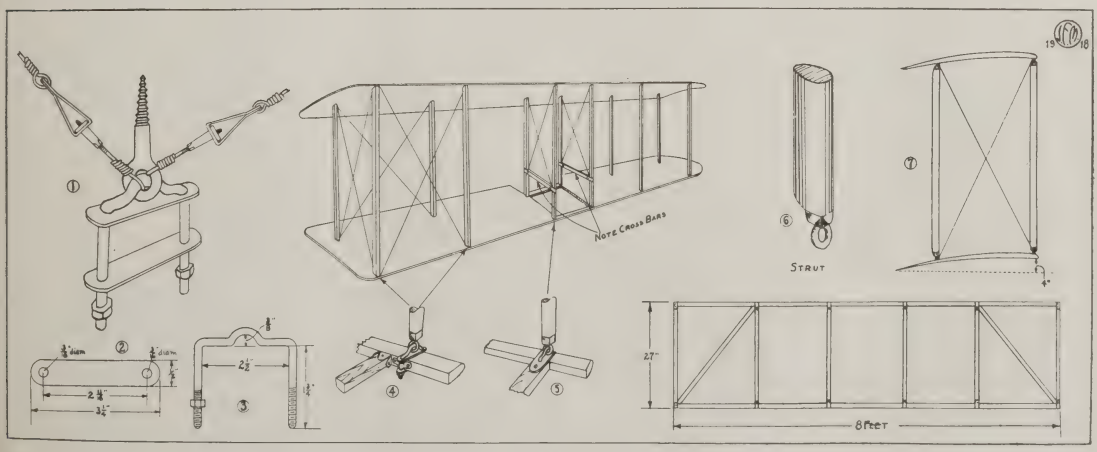
The strut connection to the wing spar is shown at the right, Figure 1. The reader can see just how it is made and the assembling. The sort of "U" bolt which is used as the clamp is made from a piece of 3/16" drill rod, threaded at each end. A standard size die for threading these ends can be purchased cheaply and the Lexagon nuts as well. Each piece of drill rod is 6⅜" long. After threading each end the piece should be bent to the shape shown in Figure 3. Two plates of iron or steel 1/16" thick to the dimensions given in Figure 2. These plates are placed over and under the wing spar. When set up on the wings the bracing wires or turnbuckles are fastened to the eye-screw and "U" bolt as shown in the sketch, Figure 1. The reader will note that the strut fittings for the eight outer struts are fastened alongside the bracing strut in the wing, while the four center struts are fastener directly over or in line with the wing-bracing struts. When placed over the struts it is necessary to drill a 3/16" hole through the metal straps 2 19/32" from the outside edge of the wing spars. No top plate is needed on the center strut fittings as the metal strap will keep them from crushing the wing beam. On the outer strut fittings it is necessary to have something to keep them from moving out of place when a strain is on the bracing wires. A fitting for this purpose is made from a piece of 1/16" thick steel or iron about 1½" long and ½" wide with two 3/16" holes at each end. This plate is bent in the centre and then flattened to the ends to allow it to be screwed to the wing beams, as shown in Figure 4. The inside prong of "U" bolt is then shoved through this fitting and bolted in place. Arrows point from Figures 4 and 5 to show the fittings that apply to the struts. Of course, the rear strut fittings are identical with the front ones.

The plane should be set up before covering to see how things fit, as it is easier to make corrections when covering is not on. When set up, the leading edge of the planes should be 4" higher than the trailing edge, to give it the necessary angle for flying. See Figure 7.

It is necessary to have some sort of support for the operator, so we will place two bars of spruce, 2" x 1", between the two centre struts and fasten them in place with metal straps. Notice that the bracing wires don't go to the bottom fittings in this case instead the end at the cross bars, so as not to interfere with the operator, as he will use these bars to support his weight by hooking his arms over them when in flight. This will be shown later.

The method of bracing is shown in the large sketch. The wires are fastened to each strut fitting and cross to the opposite one, above or below, as the case may be. Some of the bracing wires are left out of the sketch for clearness.

When the reader is satisfied that everything fits correctly, he can cover the planes with some thin, white material, such as muslin, and then dope it with a mixture of 1 pound of powdered glue, 1 ounce of alum, 2 ounces of glycerine, and boiled in enough water to allow it to be painted on with a brush.



The material should be cut in pieces 10' 6" long and sawed together side by side until the width is over 26' or the length of the planes.

To cover, fasten the cloth to the front wing spar with small tacks. The covering is then brought back, so that the two ends of the cloth double over one another and are fastened at the trailing edge. The strut fittings are not in place when covering is applied, but holes are made for them in the covering.

The tail plane is made of ½" square spruce, as shown in the lower right hand side of the cut.

The cross pieces are fastened to the long strips by thin metal straps and small nails.

(To be continued)

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

"The Hymn of Hate"—Offensive Patrol

Onward, Baby Nieuports,
Flying out to war,
Lewis guns all loaded
Engines all a'roar.
See, the Flight Commander
Leads against the foe,
Five machines with engines revving
Cylinders a'glow.
Onward, Baby Nieuports,
Flying out to war,
Lewis guns all loaded
Engines all a'roar.

At the sign of triumph
The wily Hun doth flee.
"Dive then, Baby Nieuports,
Dive to victory."
Albatrosses quiver,
Engines glowing red,
Crack! crack! crack! behind them,
Pumping them with lead.

See the Albatros's
Tanks begin to leak,
As the guns of Nieuports
One and all do speak.
Diving ever downwards,
Every wily Hun,
Into flames they're bursting.
"Nieuports—you have won."

Pull your joy-sticks backwards
Zoom towards the skies.
Up to fifteen thousand
Fast the Nieuports rise
Guns once more are silent,
All their rounds are loosed,
Now they're flying Westwards—
Flying home to roost.

Welcome, Bristol Fighters,
Who towards us soar,
Blend with ours your engines
As we homewards roar,
"We have done much battle
With the Albatros,
Never will they fly again
Now they bite the moss."
Onward, Nieuports, Bristols,
Flying out to war,
Lewis guns all loaded
Vickers guns galore.

—The Aeroplane.

Extracts from the Letters of My Chum in France

It is cold and misty, and when it is not misty it is windy, and when it is neither, it rains and so on, but mist from the marshes is the worst by far. So sometimes we sits and thinks and cusses and smokes; and sometimes we just sits.

This morning I stalled machine all round aerodrome. Wind screen completely frozen over; had to take machines to 1,000 feet, lean out and clean screen. Same day got in hot air over factory chimneys. Hell.

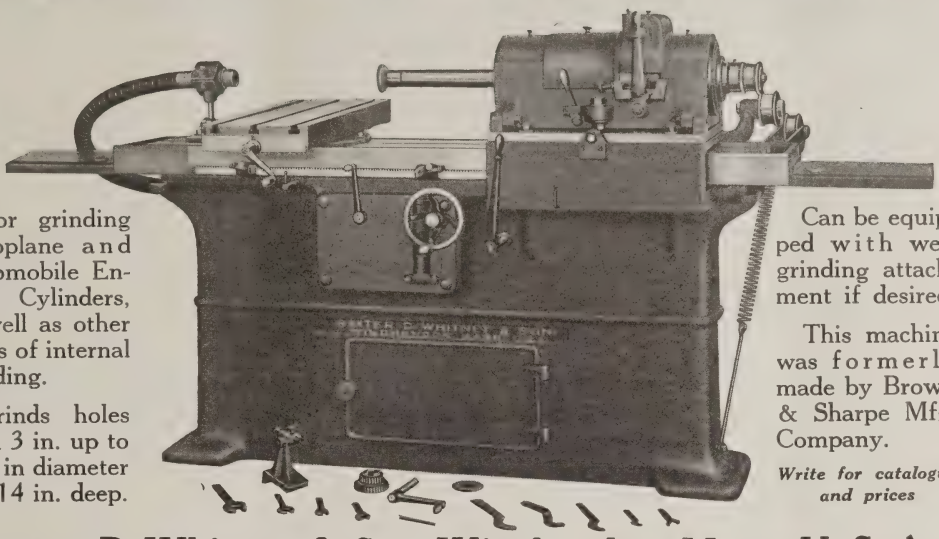
Second solo on new type. Sideslipped through not having flying speed on a turn. Ghastly sensation.

Dunno why the other squadron was mentioned in despatches. They have about seven of our chaps there. Maybe that was why, or perhaps the General lost some money at Bridge to the C. O., or perhaps they drew lots for it.

One could hear the bang of the big guns as they fired salvos under us, and at times we got bumps from the shells passing close to us. I don't know how close they were, but they were not fired at us.

Was sent out photographing, had a dozen shots at it and then, as I reached a height of 6,000 feet, I thought I would try to do my first loop. I shoved the nose down, 70, 80, 90, 100 m. p. h. The pitot tube would not register any higher; the liquid went out at the top—pulled the joystick back into my tummy and up went the nose—Gee—how slowly it seemed to go. Ah, she's over at last. Cheer-o. Now I'll write home and tell them. No, I must do another. If I did only one, they would think I had funked it after the first shot. Down goes the nose again, then up-up slower, slower. By Jove, she's going to stick at the top of the loop this time—I grip the joystick with both hands. Ah, she's over. Now I'll get off to the aerodrome and show them how to do it. I was quite bucked at having done it and it was a curious sensation, to say the least. I have been warmly congratulated; they were d—d good loops.

As I was going out of the aerodrome, I flew over a passing car and we waved merrily to each other. Then I chased the car, slowed my engine and dived at it, and a little later flew at it again. The driver must have been watching me too closely, for he went into the ditch. My passenger was awfully bucked about it.



Well, I have very little news for you this time. To let you down lightly, I will tell you that I am having several new walking sticks made, and you, with your usual Sherlock Holmes intelligence, you will deduce, quite accurately, that I have carefully and conscientiously reduced a B. E. 2c. to its molecular constituents—in other words, crashed it.

OUI, THIS IS FRANCE

By "Alex"

Cylinder Grinding Machine

For grinding Aeroplane and Automobile Engine Cylinders, as well as other kinds of internal grinding.

Grinds holes from 3 in. up to 7 in. in diameter and 14 in. deep.

Can be equipped with wet-grinding attachment if desired.

This machine was formerly made by Brown & Sharpe Mfg. Company.

RESISTAL EYETECTS

STANDARDIZED BY THE U. S. NAVY

A special test of RESISTAL AVIATOR EYETECTS was conducted on September 18th by the U. S. Bureau of Standards. This test was both optical and physical. The official report of the Bureau of Standards found that the surfaces of the lenses were flat to within about a dozen wave lengths of sodium light and therefore would not magnify the image nor trouble the user by distorting his vision. One fact of great importance, they said, was **that the lenses gave off no splinters when broken.**

NAVY AVIATORS ARE SUPPLIED BY THE NAVY DEPARTMENT WITH RESISTAL EYETECTS

Send for Booklet telling of many aviators' experiences, for free test pieces of RESISTAL lenses and for the three complete Reports of the U. S. Bureau of Standards.

RESISTAL S. & B. N.Y.

EXPORT IMPORT

33 WEST 42d STREET NEW YORK, N. Y.

WE SPECIALIZE

3 ply, 5 ply, 9 ply and 15 ply, birch, mahogany, walnut and red gum waterproof veneers. Our products have officially passed Government test of boiling of twenty-four hours and baking twenty-four hours. Capacity 30,000 square feet daily. In an official Government report on sample three and five ply panels submitted by us for test, it was stated—

> **"Boiling tests and salt water soaking tests as follows were made on each specimen: Specimens were boiled for 8 hours, then baked for 24 hours at 100 deg. C.; specimens were soaked in salt water (4% salt by weight) at room temperature for 24 hours and then baked for 24 hours at 100 deg. C.**
>
> **"Results:—The glue held firmly in all tests. Neither the boiling nor the salt water soaking tests caused any indications of separations of the plies of the veneers tested."**
>
> **Dated, March 30th, 1918.**

Laminated wing beams of spruce. We have under contract a supply of aeroplane spruce and could undertake to manufacture 50 sets of 8 wing-beams daily. In an official Government report on a sample wing-beam section submitted by us for test, it was stated —

> **"Conclusion:—These beams carried a much greater transverse load than solid wood beams of the same material and section. The glue joints between web and flanges are stronger in shear than the web section, and the glue had fairly good waterproof qualities. These beams show the superiority of the laminated construction over the solid construction as to strength and great saving in material."**
>
> **Dated, March 11th, 1918.**

We offer single ply birch, maple, walnut, mahogany and red gum in sizes cut to order.

SHIPPER IN CAR LOTS OF

Spruce, Ash, Oak, Birch, Cherry and other manufactured aeroplane lumber.

IMPORTER OF CLAUDEL CARBURETORS

(*Continued from page* 212)

ROCHESTER, N. Y.

Kaiser Trying to Save Throne

From the *Democrat and Chronicle*

The Kaiser is trying to save his throne. He is seeking to end the war before his people find out that he has lost it. He does not want peace. He wants an armistice of a dozen years in which to get ready for another war. He has got himself into a bad hole, and he is trying to crawl out of it. The Germans can give only one acceptable guarantee that they really want peace—that is, the unconditional surrender of the German army and the German navy.

SPRINGFIELD, MASS.

Surrender and Reparation

From the Springfield *Union*

When Germany and her allies are prepared to make an unconditional surrender, then will it be time to discuss matters of territorial settlement in accordance with the principles of essential justice. A peace of concessions to Germany cannot be other than a dangerous peace for the future safety of civilization. Unconditional surrender and reparation for her crimes, so far as such reparation can be made by the payment of indemnities, should be our answer to the Huns' cry for peace.

CHICAGO

No Potsdam Peace Wanted

From *The Tribune*

Potsdam has rested its fate on power. The Allies will rest their fate on power. Potsdam has never kept faith. The Allies will make peace when Potsdam cannot be faithless to it. All the world longs for peace, but the Allies want no Potsdam peace, and will fight until peace is our peace. There is but one answer to such offers of parley as have been made or are predicted. That answer is our redoubled efforts against the enemy. We can rely upon that answer from our fighting men, and we at home must back them with a singleness of purpose matching theirs. All that we can give is little to what they are giving. But let us give with a will. Let the answer of the American people be the answer of the victorious army.

BALTIMORE

Exterminating a Criminal

From the Baltimore *Sun*

Absolute surrender is the sine qua non for peace, the condition precedent to the consideration of terms. The fact to be kept constantly in mind is that this is not a war against a nation or a combination of nations, but against a great criminal which has deliberately organized to conquer and plunder the world.

No Peace by Negotiations

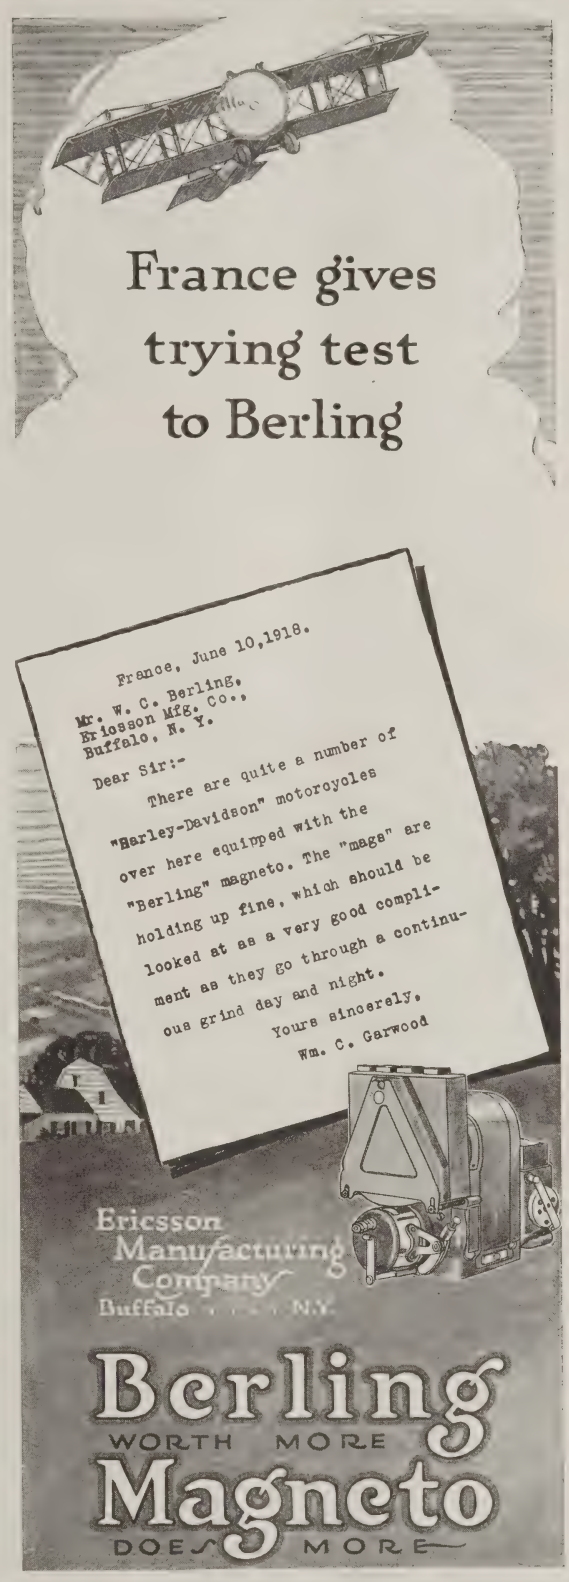
From the Baltimore *American*

There can be no peace by negotiations with the Central Powers as at present organized. This suggestion cannot be put too nakedly or bluntly. It is time for shirtsleeve directness. The United States is preparing to put all of its tremendous potency into the smashing of Hunism. Our getting into this war is no bluff, and Hunism will not be permitted to turn it into a bluff.

CINCINNATI

"On to Berlin"

From the Cincinnati *Enquirer*



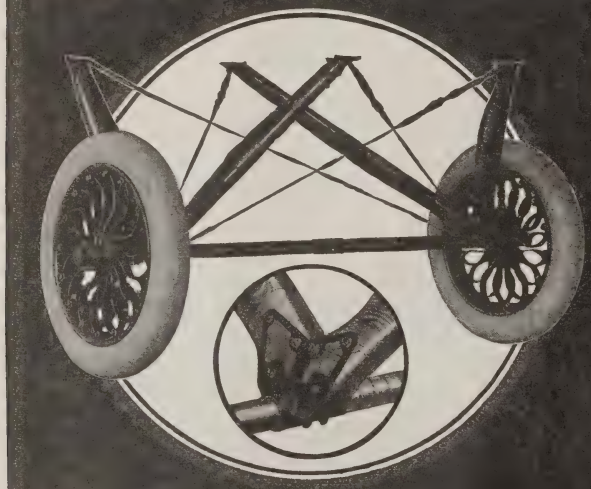
Unconditional surrender will dominate all peace terms considered by America and her allies. The only peace terms that will be accepted will be dictated with the flags of all the Allies floating triumphantly in Berlin. Terms so clearly and forcibly stated by President Wilson, ratified by each and every one of the nations warring against Prussianism—these terms, and these alone, will be accepted at the proper time and place. Restoration and indemnification of Belgium, restitution of devastated France, recognition of independent Poland—these are only a few of the essential, vital and acceptable terms of peace that must be considered at any conference of the Allies. "On to Berlin."

INDIANAPOLIS

Militarism Must Be Crushed

From the Indianapolis *Star*

Militarism must be crushed. That cannot be accomplished by compromise or negotiations; the militarists must lay down their arms, surrender unconditionally, so that there can be no doubt either in the Teutonic mind or elsewhere that the German war machine and the spirit that made it possible has been broken.



Thomas

Rapid Balance at Nominal Cost.

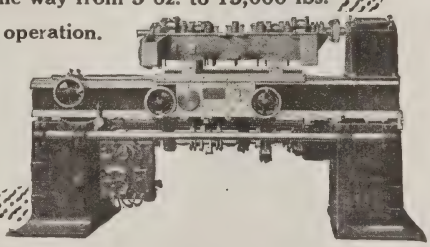
The old fashioned cut and try method of obtaining running balance—especially with turbine rotors, motor-generator sets, having two armatures mounted on one shaft or with other very long rotating elements—often required efforts extending for days or even weeks, accompanied by much "higher mathematics" regarding critical speeds, etc.

These difficulties have been so multiplied by the modern tendency toward constantly higher speeds that they almost determined the limitations of the designing engineer. With the advent, however, of the

CARWEN DYNAMIC BALANCING MACHINE

These problems have been solved by a direct, straightforward procedure, which quickly determines the exact amount of metal to be removed from, or added to, any rotating element to put it in exact running balance. It also locates positively where this change should be made.

With ordinary shop skill and a "Carwen", 100 armatures (or crankshafts) can be put in precise running balance—not mere static balance—in an 8 hour day.



Made in sizes suitable for balancing objects weighing all the way from 5 oz. to 15,000 lbs.

Send for illustrated booklet that describes principle and operation.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912, of AERIAL AGE WEEKLY, published weekly at New York, N. Y., for October 1, 1918, State of New York, County of New York, ss: Before me, a Notary Public, in and for the State and county aforesaid, personally appeared G. Douglas Wardrop, who, having been duly sworn according to law, deposes and says that he is the Business Manager of the AERIAL AGE WEEKLY, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are: Publisher, Aerial Age Co., Inc., 280 Madison Avenue, New York; Editor, Henry Woodhouse, 280 Madison Avenue, New York; Managing Editor, G. Douglas Wardrop, 280 Madison Avenue, New York; Business Manager, G. Douglas Wardrop, 280 Madison Avenue, New York.

2. That the owners are: (Give names and addresses of individual owners, or, if a corporation, give its name and names and addresses of stockholders owning or holding 1 per cent or more of the total amount of stock.): Aerial Age Co., Inc., 280 Madison Avenue, New York; Henry Woodhouse, 280 Madison Avenue, New York; G. Douglas Wardrop, 280 Madison Avenue, New York.

3. That the known bondholders, mortgages, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: (If there are none, so state.) None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholders or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

5. That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown above is: (This information is required from daily publications only.)

G. DOUGLAS WARDROP,
Business Manager.

Sworn to and subscribed before me this 27th day of September, 1918.

(Seal) JOHN J. HALEY,
Notary Public, New York Co., No. 18.
(My commission expires March 30, 1920.)

(*Continued from page* 216)

wholly conclusive as to the special value of these connections, and further tests are contemplated.

D. *Characteristics of constructive materials.*—A number of tests on materials entering into aeroplane construction have been made, and in particular satisfactory progress is reported in the development of a cotton substitute for linen aeroplane fabric. (See Report No. 22, pt. 1.) An extended investigation has also been carried on relating to the physical characteristics of balloon fabrics and with special reference to the factors which enter into the strength, durability, and gas-tightness of such fabrics. Specifications for balloon fabrics have been furnished to the Army and Navy covering fabrics of the same general type as are now being used, and with the addition of certain refinements relating to uniformity of construction and finish considered from the viewpoint of the influence of the fabric on the gas-retaining properties of the rubber film. (See Report No. 22, pt. 2.) A considerable amount of experimental work has also been carried on in connection with the physical properties of light alloys adapted to aeronautic construction, and also types of alloy steel. This investigation is continuing, and report in detail is not available for inclusion in this report.

E. *Generation of hydrogen.*—Satsfactory progress of a confidential nature has been made by the Bureau of Steam Engineering of the Navy Department in connection with the installation of hydrogen plants aboard ships.

F. *Standardization of specifications for materials.*—The Joint Army and Navy Technical Board, which was organized on recommendation of the Advisory Committee, is engaged with this problem, and substantial progress has been made.

The International Aircraft Standards Committee, with which this committee is working in full co-operation, is also actively engaged in the work of developing satisfacory standards for international adoption at the forthcoming conference to be held in London, and definite progress is anticipated along these important lines.

Appropriations for the Fiscal Year 1918

The appropriation "National Advisory Committee for Aeronautics, 1917-18" carried in the naval appropriation act approved March 3, 1917, is as follows:

For scientific research, technical investigation, and special reports in the field of aeronautics, including the necessary laboratory and technical assistants; traveling expenses of members and employees; rent (office in the District of Columbia, not ot exceed $1,500); office supplies, printing and other miscellaneous expenses; clerks; draftsmen; personal services in the field and in the District of Columbia: *Provided*, That the sums to be paid out of this appropriation for clerical, drafting, watchmen and messenger service for the fiscal year ending June 30, 1918, shall not exceed $12,000; in all, $107,000.

This appropriation became immediately available upon the passage of the act, and, added to the continuing appropriation of $5,000 a year for five years, carried in the act establishing the committee, made a total of $112,000 available for the fiscal year 1918.

In order to provide funds for the completion of the committee's research laboratory, the following amendment to the above appropriation was contained in the urgent deficiency act approved October 6, 1917:

National Advisory Committee for Aeronautics: Such portion of the appropriation "National Advisory Committee for Aeronautics" carried in the act making appropriations for the Naval Service for the fiscal year ending June thirtieth, nineteen hundred and eighteen, approved March fourth, nineteen hundred and seventeen, as may be necessary, not to exceed $40,000, is made available for the completion of the committee's research laboratory now under construction, and for the construction of additional buildings necessary in connection therewith.

Estimates for the Fiscal Year 1919

The following estimates of expenses for the fiscal year 1919 have been submitted by the committee in due form:

For scientific research, technical investigations, and special reports in the field of aeronautics, including the necessary laboratory and technical assistants, traveling expenses of members and employees, rent of offices in the District of Columbia, office supplies, printing, and other miscellaneous expenses, equipment, maintenance, and operation of research laboratory, and construction of additional buildings necessary in connection therewith; purchase, maintenance, operation, and exchange of necessary aeroplanes and one motor-propelled, passenger-carrying vehicle; clerks; draftsmen; personal services in the field and in the District of Columbia: *Provided*, That the sum to be paid out of this appropriation for clerical, drafting, watchmen, and messenger service for the fiscal year ending June thirtieth, nineteen hundred and nineteen, shall not exceed $20,000; in all, $260,000.

Conclusion

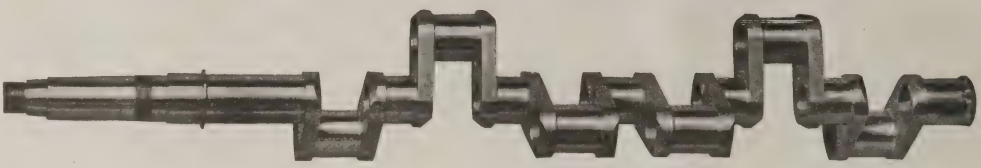
In conclusion attention is invited to the following:

1. The committee has been in existence about two and one-half years and during that time has carried through and prepared for publication 23 technical reports dealing with various phases of the science and art of aeronautics. It has further been occupied in the design and construction of its first laboratory units at Langley Field, which will be ready for occupancy early in 1918. It has further occupied itself with a great variety of questions relating to the preparations for war and with the various activities which have sprung up as a result of the existing state of war.

2. The plans contemplated for the coming year include:

(*a*) A continuance of the manifold miscellaneous activities resulting from the existing state of war.

(*b*) The completion of the first laboratory units at Langley Field and the installation of the necessary apparatus and equipment.



(*c*) The organization of a small scientific staff and the investigation of many important problems relating to the science and art of aeronautics, and with a view to their practical solution and application to the present war demands.

3. The preceding years of the committee's activities must therefore be viewed in some degree as preparatory for the more effective service which the committee hopes to render through its laboratory facilities at Langley Field and through the enlarged technical and scientific staff contemplated in connection therewith.

4. The committee trusts that these opportunities for enlarged service, and with special reference to the present war conditions, may be found an adequate justification for the appropriation herein requested.

Respectfully submitted.

W. F. Durand, *Chairman.*

scription: Domestic, $4; Foreign, $6. Entered as second-class matter March 25, 1915, at the Post Office at New York, under the act of March 3rd, 1879

Liberty Starter

Used on U. S. Naval Hydroplanes, where Absolute Dependability is Imperative

A small air cylinder, 1¼" x ¾" with piston running continuously for air pressure on gasoline feed tank is combined with the device and entirely independent in action. This starter furnished with or without it at option.

Weight, 49 pounds complete. Cranks motors up to 500 horsepower.

The device itself weighs but 30 pounds.

It is entirely self-contained without brackets or other gearing, bolting direct to crankcase of engine, and cranking direct to end of crankshaft.

Official Tests All Satisfactory

HALL-SCOTT MOTOR COMPANY
Dec. 6-7, 1916

WASHINGTON NAVY YARD
Aeroengine Testing Lab.
Oct. 23-24, 1917

LANGLEY FIELD
May 15, 1918

Information regarding these trials given on request.

THE simplicity and reliability of the Liberty Starter for Airplanes are due to the fact that compressed air, the most reliable and easily controlled motive force known, is the actuating energy.

Where chances of starter trouble cannot be taken, as, for instance, on naval seaplanes, this type of starter is equipped. Liberty Starters have been thoroughly tested by the U. S. Navy, and are used on U. S. Naval Planes. (See list of tests made.)

The Liberty Starter is an air motor for starting, and a compressor to store air for its own energy in starting. It is entirely self-contained; couples direct to end of crankshaft of motor; needs no alteration in motor or gear reduction, and has ample power for magneto starting. It is the *one* efficient, *dependable* type of starter for airplanes to-day.

We welcome comparative tests, and will gladly arrange for any kind of trial for the Liberty Starter.

Specifications on Request

"SERVICE"

"NORMA" PRECISION BALL BEARINGS

(PATENTED)

The difference in price between an ordinary part or accessory, and the best part or accessory made, is never large—never more than a small fraction of a percent of the total cost of the machine in which it is used. But the difference in the service-rendering capacity may be tremendous—may mark the distinction between success and failure of the machine as a whole.

"NORMA" Precision Bearings are the standard bearings in dependable ignition apparatus and lighting generators — because they are known to possess that factor of safety in speed service which safeguards the machines in which they are used.

Be SURE. See that your electrical apparatus is "NORMA" equipped.

Entered as second-class matter March 25, 1915, at the Post Office at New York, under the act of March 3rd, 1879

THE success of the Liberty Engine—from the standpoint of performance—is acknowledged both at home and abroad.

Into the Liberty Engine went the combined experience of Col. E. J. Hall's ten years of airplane engine building, and that of a well known automobile engineer.

The War Department's Official Statement gave Hall-Scott credit for more than 75% of the adopted parts—a fact that proves the soundness of Hall-Scott engine design.

UNCLE SAM, WE ARE HERE!

By HENRY WOODHOUSE

WHEN Uncle Sam finally saw the importance of striking Germany through the air, in the summer of 1917, and he wanted to place orders for about 25,000 aeroplanes, 40,000 motors, and the necessary equipment to build a real Air Service, he looked around and found a very meager aeronautic industry—meager because there had never been enough business on which to develop.

Then Uncle Sam called on the other industries for help and their answer was like General Pershing's answer when he landed in France. General Pershing said: "Lafayette, we are coming." The industries said: "Uncle Sam, we are coming."

On July 14th, 1918, General Pershing went to Lafayette's grave and said simply "Lafayette, we are here!" Only four words, but much more eloquent than a book.

Now that American battleplanes equipped with Liberty and Hispano-Suiza engines are actually helping the Allies advance, and, as the War Department announces, 6,600 training planes and 12,500 training engines have been produced, the Aeronautic Industry can say: "Uncle Sam, we are here!"

The next step will be to say: *"Uncle Sam, we are there!"*

This will happen soon. The shipments of planes and motors are increasing more and more substantial—and Second Assistant Secretary of War John D. Ryan will soon return from overseas with intimate knowledge of the quantity of aircraft and motors wanted, and a man-size aircraft program can be expected.

The $2,000,000,000 Aeronautic Industry of the United States

Over two billions of dollars are being spent in aeronautics in the United States. The Army in the past fifteen months was allowed by Congress a total of $1,672,000,000 for aeronautics. The naval appropriations and the orders from the Allied countries bring the total to over two billions of dollars.

To this stupendous sum will, no doubt, have to be added at least another billion dollars in the near future, because it is being realized that the number of aircraft required to prepare to win the war is much larger than was realized before.

It is generally admitted that the least that the United States can plan to do is to put and keep five thousand aviators on the fronts. This means training twenty-four thousands and supplying 118,000 aeroplanes and a minimum of 250,000 motors in one year. And propellers, radiators, magnetos, carburetors, instruments, etc., in proportion.

As was testified before the Senate Committee on Military Affairs last March by officers, and again last July, forty per cent of the aviators at the front must be replaced monthly. The replacements in machines is one hundred per cent monthly. In other words, to keep 5,000 aviators at the front for one year we must supply 24,000 aviators and 60,000 aeroplanes.

As it takes an average of two aeroplanes to train a military aviator the total aeroplanes to be supplied in a year to keep 5,000 aviators at the front would be 108,000.

About 20% of these aeroplanes will have to be single motored combat or advanced training machines; 30% will be single or double motored machines used for scouting, directing artillery fire, aerial photography, contact patrol and short distance bombing. The other 50% will have to be long distance bombing type machines as large as can be obtained. The larger the machines used for night bombing are, the greater the load of bombs they can carry. Therefore they cannot be too large.

This does not include any contribution to the Allied aircraft programs, which must be considered.

Allies Will Take Everything the Aeronautic Industry Can Produce

The Allies will take everything the aeronautic industry can produce—and more!

This is true of engines, of aeroplanes, of parts, of instruments and devices and of raw materials.

Great Britain, Italy and France have asked for thousands of motors. Great Britain has the planes ready for the motors, and the aviators ready to fly the machines and there is general regret that we cannot supply them as fast as needed because those idle planes and aviators could do wonderful work for the cause of civilization.

Able Men in Charge of Aircraft Program

The men in charge of production and operations in the U. S. Army and Navy Air Service are energetic men who can be counted upon to go as far as the official aircraft program permits them to go without delay.

The size of the program itself is, of course, the deciding factor. For this reason there is hope that during their last trip overseas Secretary of War Baker and Second Assistant Secretary of War John D. Ryan have had opportunity to go over the aeronautic subject thoroughly and that they will make recommendations to Congress for an adequate program, which will take into consideration the facts given in the first part of this article regarding the necessity of making provision for the monthly replacements in aviators and machines.

The Future of the Aeronautic Industry

To answer the query regarding the future of the aeronautic industry we must look into the future just as we looked into the future two years ago, or six and eight years ago, and try to estimate the changes which may be expected in the world's affairs from the present extraordinary situation and the possible development in size and employment of aeroplanes. I have already discussed this subject twice in the editorial pages of AERIAL AGE in the past two months and a detailed article appeared in *Flying* for October.

The duration of the war is the first thing to be considered. A war of such magnitude as the present war cannot end like a summer shower. It is more likely to smoulder on for years like a forest fire, because even if Germany should propose peace under conditions entirely favorable to the Allies, it would not be wise to discontinue the work of preparedness or to stop the manufacturing of war materials, because our enemy is a treacherous enemy and cannot be trusted. Therefore the manufacturing of war materials may be expected to continue for probably a year after the negotiations for peace begin.

Supposing the war lasts another two years—and that seems to be the absolute minimum. Considered from the standpoint of two years hence, and with two years in which to develop commercial aeronautics and establish aerial mail lines across

the continent, across the Atlantic, in South and Central America, Canada, Australia and other countries where aerial transportation will solve some of the great difficult problems of transportation, we can expect to be able to use 50 per cent of the entire output of aircraft for commercial purposes. This may be true if every effort is made in the meantime, beginning right away, to develop the aerial mail service.

If the war lasts three years longer, and every effort is made in developing the aerial mail service, when the war comes to an end not less than 70 per cent of the aeroplanes being built today can be used for the maintenance of our national defences and the aerial mail and express service.

If the war lasts four years and every effort is made, the entire output of our factories can be utilized entirely for transportation and maintenance of our national defences.

Just as those of us who worked for the building of our air forces pointed out in 1914, 1915, 1916 and 1917, that a substantial aerial mail service would build up a powerful reserve of trained aviators and develop valuable aircraft manufacturing facilities which would be available for national defence in case of need, we must today recommend this same measure to protect the welfare of this country and safeguard civilization.

It is hardly necessary for me to point out that now that we have aeroplanes capable of lifting fifteen tons and going at a speed of about 100 miles per hour, and the Air Service comprises over 10,000 aviators, and the non-flying personnel numbers over 100,000 men, the general application of aircraft for transportation is to come fast.

The delivery of mail across the Atlantic and across the continent may be as common next year at this time as the delivery of mail by aeroplane on the New York-Philadelphia-Washington route is today. The mail will be much heavier over long distances, because then the aeroplane will make it possible to make deliveries a number of days sooner.

By demonstrating that mail can be sent from Chicago to New York by aeroplane in eight hours the Post Office has emphasized the military and commercial value of a permanent aerial mail line between New York, Cleveland and Chicago.

Government orders, specifications for war materials, contracts, bids, authorizations of various kinds can be sent by aerial mail at a saving of over one day. This means truly a day gained in the production of the things needed to win the war.

It means that the regular office correspondence which, in accordance with business routine, is mailed late in the afternoon in New York will reach Chicago the following morning, thus saving a full day. By the fastest train it would only arrive there twenty-four hours later, too late to be attended to that same day.

Makes Quicker Train and Boat Connections

The initial saving of one day in the transmission of mail from Chicago to New York and vice versa is greatly increased when the letter is destined to make train connections for the West or the North or boat connections for Europe or South and Central America and the Pacific possessions and China and Japan.

Then it means a saving of days and weeks.

$50,000,000 Worth of Aerial Mail Business Waiting Development of Aerial Mail Service

To run a single line across the Atlantic will mean sending out two large aeroplanes every hour, with relays from Newfoundland to the Azores and from the Azores to Portugal, England and France. As they will be large machines, it will keep a large factory busy to supply the machines for a single line.

This will be equally true if the line is to be direct from the United States to Ireland, using large flying boats which may land at intervals to get fuel.

Here are a few points worthy of special consideration:

(1) If we all help the Post Office, within twelve months a dozen additional aerial mail lines can be established, and the Post Office will be able to send by aeroplane at least half of the one hundred million day and night letters and of the fifty million special delivery letters that are being sent each year in the United States.

(2) The day and night letters average close to $1 each, and special delivery letters thirteen cents each, making a total of over fifty million dollars' worth of business which is waiting for the development of the aerial mail service.

(3) Aerial mail day letters are most effective within distance of 400 miles. Night aerial mail letters are effective over any distance, because the aeroplane can carry mail over 1,000 miles between 6 P. M. and 8 A. M.

(4) The aerial mail system will be much more efficient and cheaper than the present telegraphic night and day letter system can be, because the sender can send a letter written in his office which does not have to be transcribed by an operator, who may make mistakes, and the message will reach the person to whom it is addressed without anybody else reading it, thereby insuring greater privacy. The cost of an aerial mail letter will be only sixteen cents, for which price there can be sent a message that would cost $5 or more by telegraph.

(5) Twenty-five million dollars' worth of parcel post can be sent by aeroplane, and about as much of trans-Atlantic mail.

(6) The Post Office pays eighty cents a pound to steamships of American registry to carry mail across the Atlantic. Charging one dollar per letter sent by aeroplane across the Atlantic, will make mail carrying across the Atlantic and across the Continent a paying proposition even now. The super Handley Page or the 2,100-h.p. Caproni could take easily in the fuselage fifty bags of mail, weighing fifty pounds each, making a total of 100,000 letters each trip.

Passenger Carrying Between New York and Chicago in Six Hours at $150 Per

Passenger carrying between New York and Chicago at $150 each is going to be a fair business proposition. A great many people would be willing to pay even more to cut the journey between the two cities down to six hours. We may predict that within two years we will see air lines between New York and Chicago having to run an aeroplane every half hour, having stations along the route, and having express and "local" service.

I could go on quoting hundreds of possible lines of development, but the above suffice to give a good idea of what we may expect—provided the aeronautic industry give due consideration to the necessity of working for its future. Few manufacturers are doing so at present. Few are taking interest in or supporting the aerial mail service.

AERO CLUB OF AMERICA GIVES $6,000.00 IN TROPHIES AND LIBERTY BONDS TO PROMOTE EFFICIENCY IN U. S. ARMY, NAVY, AND MARINE CORPS AVIATION

THE Aero Club of America announces the gift of $6,000,00 trophies and Liberty Bonds, to promote efficiency in the U. S. Army, Navy and Marine Corps Aviation.

The gift is made under the terms of the will of the late Mr. Samuel Valentine, who was member of the Board of Governors of the Club, and left $10,000.00, to be spent at the discretion of the Board of Governors of the Club, for the development of aviation.

After giving the matter thorough consideration, the Board of Governors of the Club, came to the following conclusions:

(1) That it would prove a great incentive for the development of efficiency in flying, bomb dropping, theoretical aerial combat, scouting, formation flying, and other phases of military and naval aviation, if the thousands of aviators and aviation students, who form the different Army Aviation Wings, and Naval and Marine Corps Aviation Stations, had competition.

(2) It became evident that the best results could be brought about by establishing several trophies to be competed for, under rules to be made by the Military, Naval and Marine Corps authorities, providing a trophy for each of the First and Second Provisional Wings of the U. S. Army, and one for the group of Naval and Marine Corps Air Stations located on the Atlantic Coast; and one for the group of Naval and Marine Corps Air Stations located on the Pacific Coast.

(3) The First Provisional Wing comprises a number of Army Aviation Fields which are separate units. The same is true of the Second Provisional Wing, which comprises a number of Aviation Schools located in the West. The aviators in the First Provisional Wing are mostly men who have had, or are having, advanced courses in military aeronautics. On the other hand, the Second Provisional Wing has more aviators who have not had the advanced courses. This, and the

(*Continued on page* 335)

THE NEWS OF THE WEEK

Officers Permitted to Write for Publication

The War Department authorizes the following statement:

The bar has just been removed from literary effort by persons in the military service. Hitherto, General Order No. 1, January 2, 1918, forbade them to contribute to publications or to accept pay for their writings.

Representations were made to the General Staff that since the universal service idea gathered into the army of the United States all the literary ability in the country below the age of 45, this fund of strength should be as free for use as any other special technical equipment.

It was further pointed out that since soldiers have many periods of leisure, there was no legitimate objection to their employing their spare hours in writing, and that any moneys they might thus secure they might well be permitted to accept; particularly in view of the return to the government in the form of income taxes, and the purchase of Liberty bonds and War Savings Stamps.

The General Staff was sympathetic to this suggestion and a revision of General Order No. 1 was directed. This was a matter of some difficulty, as steps had to be taken to make sure that military writers would not use their freedom for the purpose of making indiscreet utterances or giving out information of value to the enemy.

It was not thought fit that soldiers should enter into competition with the regularly accredited news correspondents; they are, consequently, still forbidden to act as regular contributors of news.

Accredited correspondents are permitted to write criticisms of the conditions and activities they encounter, but this privilege of a free press could hardly be granted to soldiers under discipline. Where they encounter incapacity or injustice they have regular channels already provided for making their complaints to the proper authorities without hindrance from offenders.

The writing of fiction, though forbidden in the original General Order No. 1, had been permitted by a special ruling, but in the new form it is specifically sanctioned. Under "fiction" will be included the drama, motion picture scenarios, and other forms of imaginative expression.

Soldiers may write letters for publication and receive money for them. Literary work of all sorts is permissible, "in so far as it does not interfere with the proper performance of duty and the full observance of discipline."

One necessary and important provision is made that "such matter as relates to the military profession, the war, or to current events" must first be submitted to and approved by the Chief Military Censor, who is also the Director of Military Intelligence, with an office at Washington.

The Censor, it may be stated, believes that the writing gift should be encouraged. It is the best form of propaganda; it keeps alive the interest in individual achievement and point of view; it will bring to light numberless picturesque bits of character and conduct otherwise unchronicled; it offers encouragement to the free expression of the American soul in those hours of its greatest experience.

The new order is dated September 28, 1918, and it is quoted in full for the information of all concerned.

"The Secretary of War directs that these papers be filed in the office of the Adjutant General of the Army, and that an amendment to Section V, General Order No. 1, War Department, January 2, 1918, be published as follows:

"V.—1. All persons in the military service, except those who are duly authorized, are forbidden to utter or publish, whether by speech, writing, print or picture, any true or false report likely to be of use to the enemy, or any criticism of persons in the Government service to the detriment of any department of the Government or to the successful prosecution of the war. This rule applies also to persons not in the military service who may be permitted to accompany any part of the army, save that it is not binding upon authorized correspondents for whose guidance special regulations are provided.

"2. All persons in the military service are forbidden to act as regular correspondents or contributors of news or articles of an informational military nature to newspapers or other periodicals.

"3. Except as above prohibited, and in so far as it does not interfere with the proper performance of military duty and the full observance of discipline, there is no objection to the publication, or to the receipt of payment for, fiction, verse, essays, letters, descriptive or technical articles, pamphlets, books, or illustrations, provided that such matter as relates to the military profession, the war or to current events is first submitted to and approved by the Chief Military Censor, Military Intelligence Division, General Staff.

"4. In the case of troops in foreign territory, the Commanding General of such expeditionary force may establish such modification or further regulations as the situation may seem to him to require.

"The object of this order is to satisfy, as far as is compatible with the protection of military interests, the natural desire of the people to keep in touch with their soldier representatives. It is, therefore, expected that all concerned will comply with both the letter and the spirit of its provisions.

"None of the foregoing applies to press dispatches filed from cantonments or camps by regularly paid newspaper correspondents not in the military service. Their copy will not be censored by military authority, but the camp commander will instruct them that they must rigidly adhere to the requests for secrecy with respect to information of value to the enemy, as defined in the printed card sent out by the Committee on Public Information. On violation of these requests, the offending correspondent will be deprived of the privilege of the camp."

Aviator Garros Is Missing Once More

Paris.—Lieutenant Roland G. Garros, a French aviator well known in the United States, who escaped last February from a German prison and rejoined his aerial squadron, has again been posted as missing after a recent flight across the German lines.

Garros figured in many aerial competitions in America in the pioneer days of aviation. At one time he held the record for altitude. He appeared in meets in New York and Southern cities, as well as in Cuba and Mexico. Garros was born at Cape Town, South Africa, of French parents, in 1885.

Air Service Age Limit 56

An announcement issued by the Air Service Officer Headquarters of the Eastern Division of the United States Army, states that the War Department through a special ruling has raised to 56 the age limit for men who desire to enlist in the Air Service.

Major Willard Wadsworth, Department Air officer in New York, in commenting on the ruling, said: "Heretofore we have been reluctantly compelled to turn down applicants who were more than 46. The majority of those rejected were skilled men, and the service has suffered a distinct loss as a result of our inability to enlist them. It is hoped that they will reapply for enlistment."

The announcement also stated that applications are again being received for commissions as pilots, bombers, observers and balloonists. Applications may be filed at 104 Broad Street.

Aeroplane Takes Piano from London to Paris

Paris.—One of the new large Allied bombing planes has brought from London a full-sized upright piano, landing in Paris safely.

The aeroplane can carry six persons and a large quantity of bombing explosives, but this

At the Aerial Gunnery School at North Island, Cal. From clay pigeons the student advances to machine guns until he can bag a Boche in the air. Here is shown one of the latest types of machine guns

weight measured in pounds was not readily comprehended, and it was determined to bring over a piano as clear evidence of the machine's capacity.

"Roosevelt Field" Honors Quentin

In memory of Quentin Roosevelt the new third field at Hempstead, L. I., has been named Roosevelt Field. It has had no name heretofore, as it has been completed but a short time.

Germans Use Fire Bombs

Paris.—The Germans during the last few days have been using in their air work a new type of inflammable bomb, combining great effectiveness with light weight. A single aeroplane, it is said, can carry 200 of these bombs.

The only way of fighting the fire caused by this new form of destructive weapon appears to be the isolation of the blaze, as pouring water on it is literally adding fuel to the flames on account of the chemicals of which the bombs are composed.

New Air Feat by Fonck

Paris.—Lieutenant René Fonck, according to an announcement made here on October 9, recently brought down four German aeroplanes within twenty minutes on the same day.

Fonck is now credited with seventy official victories, and has actually brought down 109 German machines.

Sold Guynemer's Glove

Lieutenant Bagues, at a Liberty Loan concert in the Metropolitan Opera House on October 9, as a last touch of sentiment, auctioned off a glove of the famous "ace," Guynemer, given by the airman to Mme. Purbau. The glove brought $1,250,000. The Travellers' Insurance Company and National Biscuit Company combined to buy the trophy.

Provisional Wing at Park Place Is Named for First Flying Surgeon

The home of the Second Provisional Wing at Park Place has been officially named Ream Field, in commemoration of the first flying surgeon of the Air Service, the late Major William R. Ream.

Notification of the new designation, decided upon by the Director of Military Aeronautics, was received at the field October 1 and read to the officers.

Major Ream was flight surgeon of the British-American "flying circus," which started from Indianapolis for St. Louis August 24. He was killed that day when his machine, piloted by Lieutenant Wesley Benner, fell 150 feet, the engine having stalled.

Major Ream's home was at San Diego, Cal.—*Talespins.*

Rickenbacher Gets Two More Planes in Big Air Battle

With the American Army Northwest of Verdun.—October 4 was not one in which conditions were ideal for aviation. At no time was the visibility good, but it was not so bad as to prevent operations by pursuit planes, which set out early upon their task. So active, in fact, were the airmen that the day was the busiest the airmen have had since the Meuse-Argonne offensive started.

It was hardly daylight when the aviators began operations. Soon a squadron of five Americans fought a battle with seven German machines near Fleville, in which the Americans brought one of the enemy down. Later in the morning three German aviators were reported to have been brought down by anti-aircraft guns, while in the afternoon four others were reported down within the American lines from similar means.

The Germans attacked American balloons along the front repeatedly. In most instances the anti-aircraft fire drove off the enemy planes. In a number of instances pursuit planes protected our balloons from the Germans.

On Thursday evening Eddie Rickenbacher brought down two German aeroplanes. He finished the first quickly and then tackled the second.

Lieutenant J. C. Vaseonoelos, of Denver, was the star of the day on Friday, although he brought down only one aeroplane. He was engaged with Rumpler and Fokker and shot down the latter west of Apremont. The lieutenant returned to the aerodrome with scores of bullet holes through the wings of his machine.

Just before nightfall eight American pursuit planes encountered more than twenty-five enemy machines beyond the lines while on a balloon shooting expedition. Though the Americans had accomplished their mission, when they ran onto the big German squadron a fight followed which lasted more than fifteen minutes, but when it was concluded five of the enemy planes were downed and all but one of the American squadron were on their way home, safe.

To Increase Balloon Personnel

The War Department authorizes the following:

Owing to the increased demand from the American Expeditionary Forces for balloon crews, the Balloon Corps of the Army is to be increased 25,000 men and 1,200 officers. It now numbers approximately 11,000, all ranks. Authority has been obtained by the Air Service from the General Staff to induct men of draft age and to transfer officers from the other branches of the service. This increase will create many vacancies in the grades of colonel, lieutenant-colonel, major, captain and lieutenant. Enlisted men and civilians who apply for officers' examinations will be required to take the cadet course of from three to five months, and training camps for this purpose will be conducted this winter in the South and on the Pacific Coast. The schools already established for this purpose are located at Old Point Comfort, Virginia; San Antonio, Texas; and Arcadia, California, near Los Angeles.

In addition to the important rôle played by the balloon in the control of artillery fire, it is now being used with infantry, a caterpillar mount for the winch by which the balloon is controlled having been successfully used on the front. This portable winch makes it possible for balloon companies to even keep up with infantry advances for observation and direction of attack.

In addition to the opportunities for immediate promotion, officers who join the balloon service will receive the benefit of flying pay when they actually do the work of observers and make flights in connection with army operations. Flying pay is 25 per cent of the base pay of an officer.

W. K. Vanderbilt Dined by Flyers

Paris.—William K. Vanderbilt was presented on October 4 with the rosette of an officer of the Legion of Honor at a banquet given him as Honorary President of the Lafayette Escadrille, in the founding of which he aided. The presentation was made by Jacques L. Dumesnil, Under Secretary for Aviation.

American Ambassador Sharp, ex-Premier Viviani, Brigadier General Patrick, U. S. A., and members of the escadrille were present.

Major Edmund L. Gros, Chief Liaison Officer of the American Aviation Service, an organizer of the escadrille, and Captain Thereault, its original commander, were highly praised for their work in founding and organizing the Flying Corps.

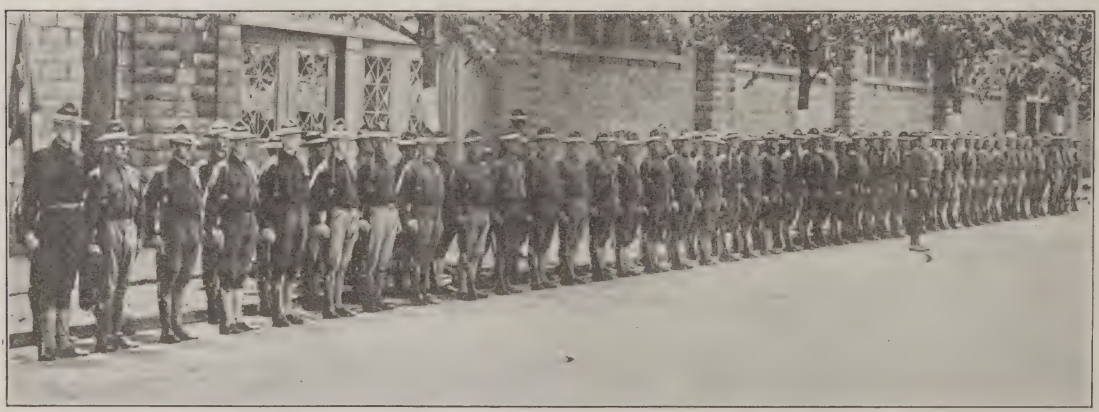
Each member of the escadrille present was given a service ribbon and a silver clasp in the shape of an Indian head, the emblem of the escadrille.

Work of American Balloon Companies on French Front

The War Department authorizes the following:

An American officer of the Division of Military Aeronautics, just arrived from overseas, reports that in the beginning of the recent offensive one American balloon company, with about 170 men and its equipment, was in Chateau-Thierry three hours after the infantry had occupied the place. It had a balloon up the following morning five miles beyond the village and was observing for American artillery with a complete line of communication established.

Another balloon company, a few hours behind the first, nevertheless got into action quick enough to bring down an enemy plane with a captured machine gun, and for the service rendered on this occasion was cited in the French Army orders. For this exploit each member of the company hereafter has the privilege of wearing a green and white cord looped over the right shoulder of his uniform.



On one edge of a wood, about fourteen acres in area, another American balloon company in this sector was so heavily shelled that it had to haul down its gas bag. In a remarkably short time, however, it had transferred its equipment to the other side of the forest and went on making observations uninterruptedly. The officer said that this forest had been used by the Germans as an ammunition dump and that this balloon company had so many souvenirs that an order had to be issued to prevent the men from loading their souvenirs in the trucks, otherwise there would have been no room for the balloon equipment.

This officer reported American balloons, manned by American crews trained in this country, on the line and doing good work. The balloon crews were becoming proficient in parachute jumping. In this, he said, there was plenty of action all the time. He said that the American balloon companies favored putting two men in a balloon basket rather than one, as was the custom with the French and English.

Need More Aviators

The needs of the fast-moving program of the Air Service, today more than 100 times greater in respect to personnel than it was when war was declared, require a number of additional men, according to Colonel Shields, Acting Executive of the Division of Military Aeronautics. Irrespective of status in the draft, the Air Service has been reopened for induction of mechanics and of candidates for commissions as pilots, bombers, observers, and balloonists, after having been closed, except for a few instances, for the last six months.

In announcing the opportunity for service in the aviation section, officials disclosed the completion here of twenty-nine flying fields, 1,200 de Haviland planes, 6,000 Liberty motors, parts for the first heavy night bombers, 6,600 training planes, and 12,500 training engines. Civilians have not been given an opportunity to qualify as pilots since last March. During last Fall and early Winter a reservoir of more than 6,600 prospective fliers, accepted by the examining boards, had been built up, but this has since been gradually drawn off through graduation.

Student Aero Squadron at Camp Dick, after one week's training

NOTHING MORE GRATIFYING TO THE NATION THAN TO KNOW THAT THE AIRCRAFT INDUSTRY CAN SAY: "UNCLE SAM, WE ARE HERE!"—*Governor Charles S. Whitman of New York.*

GOVERNOR WHITMAN and Mrs. Whitman were among the earliest advocates of aerial preparedness. By his addresses, and communications to the Aero Club of America, Governor Whitman advocated speed in developing substantial Air Forces. Mrs. Whitman, it will be recalled, was one of the first hundred American women to fly. Even Miss Olive Whitman, the charming little lady shown in the photograph by her little brother, contributed to the campaign for aerial preparedness and for the aerial coast patrol. In 1915 she christened the flying boat "N. Y. N. 1," which was presented to the New York Naval Militia by Mr. Glenn H. Curtiss, through the Aero Club of America. This gift, and other contributions from patriotic people, made it possible to train 300 aviators at private expense which were taken over by the Army and Navy and were the first American aviators to go overseas when war was declared.

Mrs. Charles S. Whitman has been very active in war work and State Organizations. She is connected with the following organizations:

Aerial League of America (Honorary Member), Aviation Committee, National Special Aid Society, American Red Cross Canteen Service for Albany, Camp Upton Community Hall Committee, Central Christian Mother's Union, Citizen's Committee for the Conservation of Children of America During the War, City Federation Hotel (stockholder), Committee for the Protection of French Soldiers Reforme No. 2, French Aerial Warfare Committee (Honorary Member), Infant Welfare Station, Little Mothers' Aid Association, Militia of Mercy, National Aeronautic Committee, National Child Labor Committee, National League for Women's Service, National Security League, New York State Conference of Mothers, New York State Committee on Women in Industry of the Council of National Defense, New York State Congress of Mothers and Parent Teachers Associations (Advisory Board), Red Cross (Kenwood Branch), Salvation Army War Work Committee, Seaside Home for Crippled Children, Soldiers' and Sailors' Club, Stage Women's War Relief, United States Navy League, Vacation Ass'n of the Civic Federation, War Camp Community Service, Woman's Christian Temperance Union, Woman's Liberty Loan Committee, Women's Homeopathic Hospital Unit, Women's Overseas Hospital, Y. W. C. A. War Work Council (Honorary Chairman N. Y. State). Received medal from the Patriotic Committee of New York City Federation of Women's Clubs.

Governor Whitman is Honorary Member of the Aero Club of America, Honorary Member of the Aerial League of America, and of innumerable national and state organizations.

Governor Whitman always believed in the future of aeronautics, and did everything in his power to foster aeronautic progress. In the pre-war days, when even the value of aircraft for military purposes was generally denied; Governor Whitman appreciated the value of aircraft and urged the building of American Air Forces at every opportunity.

It was his valuable and hearty encouragement that helped so greatly to organize the First Aero Company of the New York National Guard in 1915-16, which resulted in giving fifty-four (54) aviators to the United States Army.

When Mrs. William H. Bliss gave $10,000.00 to the Aero Club of America to purchase the first aeroplane for the New York National Guard, and contributions for the organizing of an Aero Company, Governor Whitman and Mrs. Whitman did everything in their power to assist this important development—just as they have done everything in their power to assist the organization of the Naval Aviation Section of the New York Naval Militia.

When the United States entered the war, the United States Army and Navy were able to get at least two hundred (200) men, well trained in aviation, who had been trained at private expense, through the efforts of the Aero Club of America and with the hearty support of Governor Whitman and Mrs. Whitman.

The AIRCRAFT TRADE REVIEW

A. E. J.

Agrees to Build 100 Planes Daily

Toledo, Ohio.—John N. Willys, president of the Curtiss Aeroplane Company, announced here today that he has closed with the Aircraft Board the biggest plane contract ever entered into in this country.

At a conference in Detroit, Willys contracted to turn over one hundred planes a day from March 1 on, provided the Government furnishes motors and other equipment.

Hartzell Walnut Propeller Company Opens Dayton Office

The Hartzell Propeller Co., of Piqua, Ohio, announces that Mr. H. B. Wise, their sales manager, has opened an office in the Mutual Home Building, Dayton, Ohio, to facilitate their intercourse with the various aircraft departments located in Dayton and the Middle West.

Self-Starting Device for Aircraft Motors

Milwaukee.—A starting device for heavy duty engines, designed several years ago by Nels A. Christensen, a noted inventor and engineer of Milwaukee, principally for application to motor fire apparatus and similar purposes, has been refined by him to suit the requirements of aircraft. Several hundred hydroaeroplanes in use at the navy aviation camp at Great Lakes, Ill., have been equipped with the starter. Mr. Christensen personally superintended the installations and made numerous practice flights to demonstrate the efficacy of the apparatus. He is president and general manager of the Christensen Engineering Co., 816 First National Bank Building, Milwaukee.

Planes Coming From Cincinnati

Cincinnati.—The Overmeyer Airplane Mfg. Co. has bought three acres of land at the West End and will at once begin the construction of a plant for the manufacture of aeroplanes. It will begin with three large contracts from the Government for war service and will be kept busy on Government and war work during the period of war, but the plans of the projectors are to manufacture aeroplanes for commercial and private use following the close of the war. E. C. Drury, of Philadelphia, is interested in the company.

Aeroplane Plant for Chicago

Chicago.—The Illinois Mfg. Association is negotiating for the erection of an aeroplane plant here.

Olds Will Make Liberty Engines

Lansing.—The Olds Motor Works will soon start production on its initial order of Liberty engines. The first lot of 2,000 kitchen trailers is expected to be delivered during this month. The production of passenger cars is slowly being diminished, and the plant will be entirely on war work by January 1.

Flight Tests of Caproni Plane

Washington.—Flight tests of an American built Caproni aeroplane equipped with three Liberty engines are being held by the Bureau of Aircraft Production. A Caproni plane of this type arrived here October 2 at Bolling Field from Hazelhurst Field, Mineola, L. I., and left the next day for Dayton. This Caproni is one of a few built in United States Government factories for test by American aviators and engineers. The tests are now being made in flights from various fields and will continue to be made until it is decided whether or not to put this particular type of plane in quantity production.

Daily Liberty Output Averages 278

Detroit.—The production of Liberty engines in the several plants that are carrying on this work is rapidly increasing, and during the month of September the total average daily production reached 278. It is expected that during the month of October the total output will touch 3,000 complete engines.

The Ford Motor Co. is the first plant engaged in this work to exceed a production of 100 complete engines in any one day; on September 30 120 engines were turned out. This number is increasing daily. Several of the plants, namely, Lincoln, Ford and Nordyke & Marmon, exceeded their August estimates.

Wilson Made Curtiss Vice-President

Buffalo.—At the monthly meeting of the board of directors of the Curtiss Aeroplane & Motor Corp., Charles Wilson was elected a director and vice-president in charge of production. Mr. Wilson is president and general manager of the Wilson Foundry & Machine Co., Pontiac.

Bomber Makes 143 M. P. H.

Washington.—A de Haviland 9 plane equipped with a Liberty engine flew from the McCook Field, Dayton, Ohio, to Bolling Field, Washington, D. C., with no stops in 3 hr. 5 min. The actual flight from Dayton to Washington was 2 hr. 5 min. The distance between the cities is 430 miles with the time of flight 143 m. p. h. The journey was made by Caleb Bragg, civilian pilot, attached to the Engineering Department of the Bureau of Aircraft Production. An engineering officer was the passenger. The pilot traveled by compass at a high altitude and reported no difficulty in holding the course. The plane left for New York. From there it goes on a non-stop flight to Dayton.

Quantity Liberty Engine Production Reached

Washington.—The output of Liberty aeroplane engines is fully up to expectation and has reached quantity production. Aeroplanes are now going ahead rapidly and are being shipped in trainload lots daily. These statements were made by W. C. Potter, Acting Director of the Bureau of Aircraft Production, following his return from an inspection of the factories turning out the planes and engines.

Licenses for Experimental Flight to Be Submitted to Army and Navy

Washington.—Applications for flying licenses to conduct experimental flights must hereafter be submitted to the proper Army and Naval authorities before being filed with the Joint Army and Navy Board on Aeronautic Cognizance, Building D, Sixth and B Streets, Washington, D. C.

Applications should be made either by individuals or aeroplane companies making new types of nay aeroplanes to Capt. N. E. Irwin, U. S. N., Director Naval Aviation Division, New Navy Building, Washington, D. C., and for flying army aircraft to the Technical Section, Division on Military Aeronautics, Dayton.

Personal Pars

Horace N. Trumbull, advertising manager of the SKF Ball Bearing Co., of Hartford, Conn., has entered the Reserve Officers Training Camp at New Haven, Conn.

Mr. Byler Advertising Administrator

Robert C. Byler, for nearly four years advertising production man for the SKF Ball Bearing Co., of Hartford, Conn., has been appointed advertising manager of the SKF Administrative Co., of New York City, and will direct the advertising of the SKF Ball Bearing Co., of Hartford, the Hess-Bright Mfg. Co., of Philadelphia, and the Atlas Ball Company of the same city, all of which are controlled by the SKF Administrative Co.

Until arrangements are made in New York City, Mr. Byler will remain with the SKF Ball Bearing Co., of Hartford, Conn.

A De Haviland "four" on exhibition during the recent 3800 mile Western Flight. Lieut. Col. C. K. Rhinehardt, Commander of the First Provisional Wing is shown in the pilot's seat. Night flying lights on the top wings and dummy bombs in the bomb racks, are shown

Women in the Aircraft Industry. Women working on wing manufacture in an American aircraft factory

The First Annual Banquet of the Y. M. C. A. Aeroplane School

The first annual banquet of the Y. M. C. A. Aeroplane School was held in the Oak Room of the Hotel Martinique on Sunday evening, October 6. About one hundred of the students of the school were assembled on this occasion and enjoyed the excellent banquet which was provided and listened to the interesting speeches and talks made by the guests of honor. Mr. Charles Kinsell was toastmaster and introduced the speakers with appropriate remarks. Mr. Charles W. Crossman, the manager of the school, spoke first, and he told of the remarkable growth both in numbers of students and in the equipment which they had provided. He further stated they had 42 instructors and nearly 700 students.

Mr. Crossman gave particular credit to the assistance which the Aero Club of America had rendered both in enabling them to secure motors and apparatus for teaching, as well as aeroplanes which had been donated by the Standard Company and Mr. Irenee du Pont. He stated they had about twenty motors and ten machines.

The next speaker was well known to many of those present and represented the Aero Club of America, Mr. Augustus Post, its Secretary. Mr. Post told the members of the school of the rapid development of aeronautics, and described some of the larger machines and gave the listeners a vivid description of Captain R. W. Schroeder's sensations when he broke the world's altitude record at Dayton, Ohio, and flew to a height of 28,900 feet. He also described the rapid development of the Aerial Mail Service, and from his experiences in the past gave his predictions for the future development of commercial aeronautics and the marvelous achievements which could soon be looked for in this field of aerial navigation.

Captain Oliver J. Gagnier, R. A. F., was the next speaker, and he told about his training in the R. A. F. in Canada and gave some of his experiences at the front. He gave the men a realization of the importance of the work of mechanics in connection with aviation and told how much depended upon their work in keeping the motors in perfect condition. Captain Gagnier represents the Provost Marshal of the British Recruiting Mission to the United States and has seen fighting at the front and has flown all types of British machines.

Other speakers were Mr. Samuel Ecker, formerly Assistant District Attorney; Mr. Adrian Van Muffling, the Chief Instructor of the Aviation Engine Department, and Mr. H. C. Brokaw, the Superintendent of Education.

Les Terribles

(Written exclusively for AERIAL AGE.)

Indians, lumberjacks and farmers from the Northwest made up the bulk of the 32nd division of the American Expeditionary Force in France. They were deployed north of Soissons, with the French army of Gen. Mangin.

The particular job that fell to their share was first, to break the German hold on the Bois Meuniére, which they did after six vain attacks. Then they were told to take and hold the village of Ciérges—and this they did, after it had changed hands nine times. Later they fought for four days along the Soissons railway. And in consequence they received—individually—many medals, and, collectively, the nickname from the French brothers of the "Les Terribles"—The Terrible—which they prize much more.

There is a division in this country that has orders to deploy on all fronts from September 28 to October 19, to take every village and hamlet, to fight along the railways, and not to let any dollar escape.

It's not a division, either, but an entire army, the A. L. B. B.—American Liberty Bond Buyers.

You are enlisted—don't forget that. So go to it! Put it across with the same fighting spirit that animated the "Indians, lumberjacks and farmers" of the 32nd!

"Les Terribles"—pretty fine nickname, eh? Upstanding and red-blooded-like? Why not earn it on the Fourth Loan?

Aero Carnival at Garden City

Arrangements were completed on Oct. 5th by the U. S. Air Service to stage what will be the biggest aviation carnival ever held. It is being organized by the First Provisional Wing, U. S. Air Service, Garden City, L. I., Col. Claude K. Rhinehardt, commanding, and will be held at Belmont Park on Saturday, October 26th.

Numerous aero squadrons from the various flying fields and more than 100 aeroplanes of many different types are expected for the huge exhibition. There will be athletic field games, in which flying cadets and enlisted men will compete. There will be solo flying, air stunts, scout plane races, battle-formation flying, motorcycle side-carriers' dispatch races, etc.

The proceeds will be turned over to the National Aeronautic Committee, which is working in association with the War Department Commission on Training Camp Activities and is the only committee recognized by the Commission in aviation work.

Mrs. Charles A. Van Rensselaer is chairman of this committee and Mrs. Clinton Gilbert, treasurer. The funds realized from the carnival will be used for the purchase of athletic equipment, bands' instruments, etc., for our overseas squadrons and training fields in this country, and a portion of the proceeds will be turned over to the committee's fund to provide swimming pools to the Southern training fields. The National Aeronautic Committee is doing excellent work in supplying athletic equipment in a manner that is meeting with the approval of General Kenly, Director of Military Aeronautics, and other high officers of the Air Service.

More than 207 squadrons have been supplied by this committee and 22 flying fields already equipped. However, much more equipment is needed to supply the thousands of men in the Air Service with sporting goods and musical instruments, and the proceeds of the forthcoming meet unquestionably will supply many more equipments.

The carnival is to be a popular-priced affair and an enormous attendance is expected. It will enjoy the patronage of society people and all of the leading Metropolitan Clubs. Numerous features will be added to the program as its organization progresses.

1,000 Homers Flew Here from Capital

New York.—The War Department released 1,000 pigeons near the Union Station in Washington on September 29 for a flight to New York. The following Sunday 3,000 will be liberated for a similar test. The flights started at 9 A. M., the birds being set free by men from Washington Barracks, under the direction of Major Frank Griffin, head of the pigeon section of the United States Signal Corps.

The first flight is known as the "futurity flight," and the pigeons, under six months of age, were brought from New York Saturday night. They were expected to fly approximately 1,500 yards a minute.

The purpose of these flights is to increase or exercise the "homing" instinct of the birds. In the regular army work a flight such as these is never made, but the birds are released one or perhaps two at a time, with messages.

Travel by Aeroplane

In a recent opinion from the office of the Judge Advocate General, officers travelling by Government aeroplane may draw expenses at the rate of four cents a mile, which is the rate of mileage allowed where the government furnishes transportation by prairie schooners, dog sleds in Alaska, and buffalo carts in the Philippines. The allowance for travel on trains is generally seven cents a mile. The distinction is made, not because aeroplanes are less modern than trains and therefore classed with dog sleds or prairie schooners, but because customarily there are only two methods of transportation used in the service, "train" or "otherwise." Aeroplanes fall in the latter class.

This decision settles a doubt raised in a former opinion that because the aeroplane as used in Military Service was not a vehicle, but an instrument of war, there was no authority for the payment of individual expenses of those using it for travel. Major General Wm. L. Kenly, Director of Military Aeronautics, made the point that although aeroplanes are employed for combat and other war purposes, the use of the aeroplane in the army as a means of conveyance was of constantly increasing importance.

He maintaained that this use was two-fold. First, in the theatre of operations, in connection with troops. Second, outside the theatre of operations, in the transportation of officers travelling without troops, on permanent change of station or temporary duty. In the first case, travel would be performed by aeroplane as it would be by horse, automobile, or other means, and no mileage would accrue. In the second case, travel would be performed by aeroplane in lieu of railway, and mileage, at four cents a mile, should be allowed.

The chief reason for such travel, as maintained by General Kenly, was its expediency. When aeroplanes were available, he believed, they should be used, if only for the sake of practice. There would be no additional expense to the Government in using available aeroplanes for travel, he held, nor any diversion of the time of pilots from their duty. At the same time travel could be accomplished far more quickly than by train, even on short trips, whether for change of station, temporary duty or purposes of inspection. If no mileage was to be drawn for such travel, officers would themselves have to bear the expenses, and if, for this reason, they avoided travel by aeroplane, the result in the long run would be loss of time and loss of opportunity for the full development of the use of the aeroplane.

The point was also made that there was no requirement known where travel must actually be performed by railway to entitle an officer to mileage, and examples were cited to the contrary, found in the Alaskan, Philippine, and Western Service, where, when railroads were not available, mileage had been granted for travel performed by other means of conveyance.

THE ORGANIZATION IN CHARGE OF AIRCRAFT PRODUCTION FOR THE ARMY

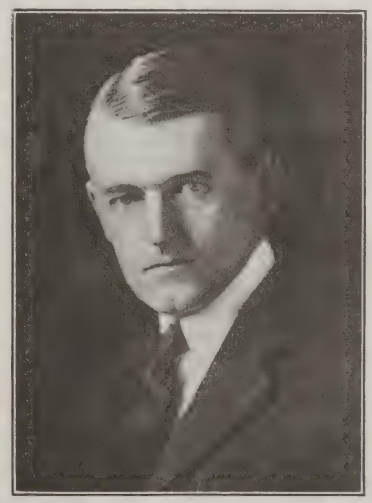
THE organization in charge of producing the aircraft for the Army has, so far, been an organization which had nothing to do with making up the size of the aircraft programme. The duties of this organization have been, and still are, only to carry out programmes as they are made, producing the aircraft as fast as they possibly can be produced.

Second Assistant Secretary of War John D. Ryan, who has just returned to America after an extended trip in England and France

This organization has been, and still is, in the peculiar position that it may be blamed for small production due entirely to outside causes, such as: (a) the smallness of aircraft production; (b) changes in aircraft programme ordered by the authorities overseas; (c) delays due to reaching a decision on the types of aeroplanes to be built; (d) failure to supply newly discovered needs, created by developments in the progress of the war, etc., etc.

Any one of these causes is sufficient to create the impression that this organization is inefficient, when, as a matter of fact, the organization may be most efficient and every one in the organization may be of the very best available.

It has been so in every one of the Allied countries. The organizations in charge of aircraft production have always suffered, the measure of their suffering being decided by the extent of the success on the part of the Germans in the air or in dropping bombs on London or Paris or Venice. The public will not accept justifications or explanations for failure to prevent the Germans from being successful in the air.



When the situation is analyzed, and it is realized that the country would suffer regardless of whether there is justification or not, the public and press can hardly be accused of being too severe.

The same may be true when hundreds of manufacturers are kept working at only part of their manufacturing capacity, although aircraft and equipment are needed in larger and larger quantities. The manufacturers can hardly be blamed for criticizing and the public and press for sympathizing with them.

And yet, in many cases in the past, the organizations in charge of aircraft production were seldom fully responsible for delays and for smallness of production. But that did not save them from the condemnation of the public and the press. In England, from 1915 to the end of 1917, it became so that every time the Germans dropped bombs on London or British soil, or British troops suffered at the front because the British Air Service was not sufficient to maintain absolute command of the air, the press and public would demand the resignation of somebody in the Aircraft Board.

The British authorities connected with aircraft production finally came to the conclusion that as they had to bear the responsibility, and no justifications or excuses were accepted, they would insist on having all the power necessary to make and carry out their own aircraft programme independent of any other organization. This brought about the organization of the British Air Ministry—and solved the problem most completely. The British public and press have not had any serious complaints since. The Air Ministry did make an aircraft programme large enough and, being free to act and having an independent organization, it developed the Royal Air Forces on such a tremendous scale that it provided the aircraft and aviators needed in the supremacy in the air on the British front as well as to protect British soil from German aerial attacks.

The officials in charge of aircraft production in the United States are, in this work, the Bureau of Aircraft Production,

W. C. Potter, Assistant Director of Aircraft Production

and it has the co-operation of a great many able officers of the division of military affairs, some of whom are: Major General William L. Kenly, director Division of Military Aeronautics; Colonel F. R. Kenny, executive officer; Colonel C. G. Brant, Colonel H. H. Arnold, Colonel W. E. Gillmore, Colonel T. H. Bane, Colonel M. F. Davis, Colonel Arthur Woods, Colonel C. G. Edgar, Colonel E. Lester Jones, Colonel A. L. Fuller, Colonel C. H. Shields.

Major-General William S. Kenly, Director of Military Aeronautics

The above mentioned officers and scores of other officers and men in their staffs, make a formidable array of efficient men, and any one in close touch with them knows that they and their organizations are capable of carrying out an aircraft programme ten times as large as the present aircraft programme.

A great many of them know that the only "safe" programme is the programme which permits building all the aircraft and motors that can be built, and as fast as they humanly can be built, and that so long as there are manufacturers working at only part of their capacity, everything is not being done that should be done. They also know that the public will hold them responsible if we fail to to produce sufficient aircraft to maintain absolute mastery in the air next spring—to do which may require tens of thousands of different types of aeroplanes.

Everybody Waiting for Mr. Ryan to Return

Everybody is waiting for Second Assistant Secretary John D. Ryan to return from overseas, and everybody hopes that following his return there will be adopted

(*Continued on page 323*)

DAYTON—AVIATION CENTRE OF THE NATION

By HOWARD EGBERT

STRICTLY speaking, Dayton assumed the aerial leadership of the nation ten years ago.

More specifically it was on one particular afternoon, May the sixth, of the year 1908.

The traditions of aeronautics credit an enterprising young newspaper reporter, safely hidden behind the foliage of a street overlooking the Sand Dunes near Kitty Hawk, North Carolina, with having made the discovery that Dayton had earned the right to leadership. When Orville Wright and his brother Wilbur made their first successful flight in a heavier-than-air machine a decade ago, Dayton suddenly became conspicuous among the cities of America. Until that day the world thought Dayton was capable of making only cash registers. Then a new star appeared in her firmament.

It was almost a week later before folks in Dayton knew their city had become internationally famous. The community at that time had about 85,000 people and a diversified lot of industrial activities. Some people were skeptical about the news. They couldn't quite grasp the fact that two fellows "following around a bicycle repair shop" had enough brains and "get up and get" about themselves to give the world its first heavier-than-air flying machine.

Some folks wouldn't believe the news until Wilbur Wright some time later actually flew over the city. His aged father, a retired United Brethren minister, and his sister, Miss Catherine Wright, had enough faith in the two boys to know that if they said they had invented a heavier-than-air flying machine, they had. The world a little later on acknowledged it. Princes and peasants in a dozen countries of the old world saw the "impossible" accomplished and thus Dayton's place in the sun became assured.

The Air Building, Dayton, headquarters of the Aeroplane Production Department and the Aircraft Experimental Department

It was Lord Northcliffe who, with prophetic vision, first saw the possibilities of this modern Dayton becoming the "air metropolis of the world." I quote his own words, just as he delivered them one afternoon in October last year, in the midst of an address in Dayton, when he conferred upon Orville Wright, the only remaining brother of the pair which had perfected the first heavier-than-air machine, the Albert Medal, England's magnificent tribute to the genius of the man. It was characteristic of Orville Wright that he thanked Lord Northcliffe for the honor, refused to make a speech and sat down quietly while 5,000 of his fellow townsmen cheered themselves hoarse in acclaiming him its hero and neighbor.

Lord Northcliffe, unlike some prophets, has lived to see his prediction completely fulfilled.

Dayton has assumed a commanding position in international affairs. Over the Western Front Dayton-made aeroplanes, the De Haviland 4's, hurl death and destruction to the Hun. Some of the men who are driving these machines are Dayton-trained pilots and gunners, from the Wilbur Wright Flying Field and Armorer's School, a short distance east of Dayton. The experimental work on these machines has been largely carried on at the M'Cook Experimental Field, within the city limits, while Dayton mechanical brains and genius have assembled the planes and Dayton pilots have been the first to drive them ten thousand feet into the clouds for their maiden-trip into the air.

Dayton is a war city. Witness its growth, if you will. Within the last two years the population has increased from 140,000 to nearly 185,000, a striking evidence of the development. Practically all of this increase is credited to the entrance of war workers of various kinds. One entire factory in the city is giving its entire output of crackers and hard bread to the government; the Dayton-Wright Airplane Company, with its one-story brick and concrete plant, 1,000 feet long, the largest building of like construction in Ohio, employs 6,000 men and women, day and night, turning out aeroplanes, the while operating a secondary plant with 500 workmen at Miamisburg, a few miles southwest of the city.

Dayton is a city of 1,000 smokes. Day and night its great engines of industry hum to the tune of Mars. The great National Cash Register Company, where once the world's output in cash registers was made, is given over entirely now to

AERONAUTICS LEAD DAYTON LIBERTY LOAN PARADE

In the recent Liberty Loan Parade in Dayton, the interest in the whole event was dominated by the aeronautical exhibits arranged by the Department of Military Aeronautics and the Dayton Wright Airplane Co. The first Wright biplane was enthusiastically received all along the line, and great interest was evinced in the German machines shown, and in the latest type of American machines

View of the Dayton-Wright Airplane Co.'s factory

the making of aeroplane parts. Lights from hundreds of plants working by night, speak eloquently of the feverish haste with which the city goes about its task of furnishing the weapons of warfare for the soldiers of the republic "over there".

It is related that Orville Wright not so very long ago, in an interview, declared that the use of the aeroplane for winning wars, was the furthermost thought in his mind and the mind of his brother Wilbur. As a matter of fact the two brothers in the light of current history of their beginnings, did not seem to have any par-

ticular idea in mind in building the first heavier-than-air machine, other than to develop a scientific principle which, in their own mind, could be speedily and succesfully solved. "The thought of using aeroplanes for bombing defenseless cities and killing women and children never entered our minds ten years ago, when we were perfecting our first machine," Orville Wright said.

But the keen observer of events, William Hohenzollern, Master of Potsdam, saw far into the future that bright afternoon many years ago as he stood before his castle gate in Germany and saw the Wright flying machine gracefully soaring over his estates. His mind became inflamed at once with a desire to use this mechanism to further his own selfish ends.

Orville Wright can tell you better than I can, how "William the Withered" stood appalled at the accomplishments of that Dayton-made machine; how his eyes glistened and his heart throbbed as he pierced the clouds of the future and saw the world at his feet, shackled by the power of monster aircraft that would win for him conquests that even his well-trained armies could not hope to win.

Dayton's reputation as the air metropolis of the world was first established in the Old World, which has always been ripe for scientific achievements and eager to bestow upon its men of learning and development, as well as upon men and women of the young republic of the western hemisphere, tributes of interest and appreciation. While Europe was acclaiming the Wright brothers' accomplishment as the greatest of modern times, practically nothing was heard of it in America and very little in Dayton, because the Wright brothers, following their initial flights abroad and later at home, went into seclusion and set about to perfect the thing they had started.

The world war brought Dayton into the forefront once more.

The first stroke was the building of the Wilbur Wright Flying Field, at Fairfield, five miles east of Dayton. This plant was erected, completed and occupied in less than six months' time and formally opened in July, 1917, with Major A. R. Christie as commandant. From its very beginning it assumed the work of training students in the art of flying and since its opening more than 5,000 fliers have come in and gone out, either overseas or to more advanced courses in other fields in America or France. The field comprises 2,500 acres and was leased by the government from the Miami Conservancy District, an organization which came into existence following the disastrous flood of March, 1913, which swept the Miami Valley in southern Ohio with a property loss of $200,000,000 and claiming more than 400 lives.

The field, despite reports and discussions to the contrary, is located on ground sufficiently high to protect it in time of flood; the engineer's estimate shows the post stands 20 feet above the flood level of 1913, a level newly established for high waters. Draining difficulties early developed and had to be rectified, and improvements were constantly made until in the fall of 1918 the flying school was abolished and in its place an Armorer's School and Testing Field was established. The field is now used for these purposes and is meeting every demand along these lines. Major Thomas Duncan, U.S.A., is commandant at the post.

The Wilbur Wright aviation field very naturally attracted considerable attention to Dayton, being one of the foremost aviation posts in the country and having adjoining it the General Depot of supplies for all aviation fields in the middle west.

The M'Cook Experimental Field came into existence a number of months later and was located in the northeastern end of the city. It comprised thirty acres and offered a suitable spot for experimental work. Colonel J. C. Vincent, one of the inventors of the Liberty motor, came to Dayton and established his headquarters, superintending all experimental work on the motor and giving his personal attention to a development of this mechanism.

Colonel Vincent has since resided in Dayton and has been foremost among the aviation celebrities who have become a part of the army of workers and leaders in this branch of the service here.

The chief objection to the M'Cook Experimental Field has largely been its size. Many army and aeroplane men have contended the field is not properly located, nor of sufficient size to carry on experimental work of the size required by the government.

The Dayton-Wright Aeroplane Company owns and controls two flying fields at Moraine City, south of Dayton, both capable of handling any demands and requirements made upon them by the continually increasing business at this plant.

The crowning feature of Dayton's triumph was the selection of the city as the national headquarters for the work of the experimental and production service of the aircraft department. For months men closely identified with the work of this department had been housed in several buildings of the city. This, very nat-

Miss Della Dohner, Hand Mill Department of Dayton-Wright Airplane Co., shown operating a mill which cuts slots in aircraft nuts, five in one operation

urally, was not a systematic way of doing a great work and as the result the government finally took over a lease on the newly completed ten-story office building of the Dayton Saving and Trust Company located in the very center of the city. More than 40,000 square feet of office room is available for the departments coming under the direction of the aircraft production and experimental bureaus. The removal of the technical headquarters to Dayton brings more than 500 persons who were previously engaged in Washington and scores of highly trained men in aeronautics have come to Dayton to take up their residence and pursue the duties which have followed in the wake of an ever increasing aeronautical programme for the United States government.

Industrially, Dayton has carried its share of the responsibility for the manufacture of aeroplanes. Three concerns are at present devoting practically their entire plants to making aeroplane parts—the National Cash Register Company with 5,800 employes; the Maxwell Motor Company with 1,100 employes in this particular branch of federal service; and the Dayton Metal Products Company with 4,300 employes. In concrete figures this would mean that eliminating from consideration the 5,500 employes at the Dayton-Wright Airplane Company at Moraine City, nearly 12,000 persons are directly engaged in making aeroplane parts for the government in Dayton. The Dayton Engineering Laboratories Company (familiarly known to the trade as The Delco), is making all the ignition features for the Liberty Motor, which is now so vital a part of the American-made aeroplanes, and thus 3,000 more men and women are directly concerned in the matter of aeroplane equipment, in Dayton.

Figures like the ones quoted above give in a way some comprehensive idea of the man-power and woman-power, too, (because women by the thousands are doing their share in shops and aeroplane plants to win this war by aeroplane).

Much of the work of furnishing the parts for aeroplane construction is turned out by the plant of the Dayton-Wright Airplane Company, located at Miamisburg, where several hundred persons find employment. Since I am writing more particularly about the work for and in behalf of the aeroplane industry in Dayton, I need not attempt to cover the work of hundreds of industrial plants in the city which are contributing with their more than 35,000 workmen to the various kinds of war work in course of preparation; this work would include the making of tanks, lenses for government use, shells for this and allied countries, etc. Dayton is a war city and it has no time for any other consideration until after the war is won.

A view of Wiring Department, Dayton-Wright Airplane Co.

Address by C. F. Kettering, Suggestion Contest, April 27, 1918. Employees from all plants assembled at Plant No. 1, Dayton-Wright Airplane Co.

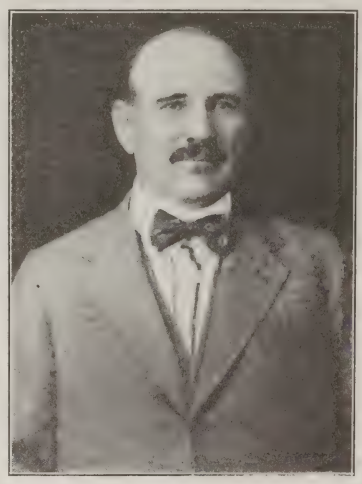
Ten years have passed—momentous years in the history of the world, since Orville and Wilbur Wright first gave to the world their first aeroplane; a crude sort of machine as compared with the great De Haviland 4's which skim the skies over Dayton today. Not so very long ago Orville Wright was taken through the Dayton-Wright Airplane Company plant and given his first ride in the modern bombing machine made there. He soared to dizzy heights under the guidance of a skilled pilot from the aeroplane concern, and when he alighted, it is recorded that he was so amazed at the wonderful progress that had been made with flying machines since that eventful day at Kitty Hawk, N. C., that he found words inadequate to express his surprise.

Dayton has never lost its interest in the aeroplane. The years that have intervened from that eventful day when Wilbur Wright first rode over the city in his newly designed heavier-than-air machine, have failed to dim the interest of the community in the progress and development of aeronautics. Hundreds of men whose names are associated with the air missions of a half-dozen nations, have come to Dayton and stood amazed at the progress the city has made in aeroplane development and the magnitude with which things move along. Scarcely a train pulls into Union Station that does not bring a celebrity to one of the flying fields or the technical headquarters of the aircraft board of the nation. Men come in and go out and the public hears nothing of their visit, so silently and without publicity does the program go forward.

But the greatest point of activity has not yet been reached in Dayton. Contemplated enlargements of many plants and increased demands from the government point the way to an even more tremendous service.

The people in Dayton still think the Wright way to Berlin is the right way to win the war.

THE PERSONNEL OF THE AIR SERVICE IN DAYTON



BY HOWARD EGBERT

IT becomes a rather difficult thing for the average mind to comprehend the field of activities in aeronautics as it spreads out over Dayton and immediate environs. The swift moving ships in the air, thousands of feet above a hustling, business community, tell us nothing except that man has succeeded in mastering a machine heavier than air and is flying. Orville and Wilbur Wright did that much ten years ago, and the field has increased so immeasurably since that hour of the Wright brothers' triumph at Kitty Hawk, N. C., that there really is no way of comparing the two periods in the development of aeronautics in America.

If you walk past the Air Service Building in Dayton, a towering structure of modern design, you scarcely get the inspiration, because it is on the inside of this building where hundreds are at work, away from the curious eyes of the passers-by that the work is done. Telegraph keys are bearing news and instructions and information from all over America and from the fields of France. Brilliant minds selected from many professions are at desks, figuring, dictating, deciding, experimenting and consulting, the one with the other. The genius of engineering and production match each other in this air building. These two departments dove-tail in their efforts.

Central control, generally conceded to be the business way of handling any enterprise successfully, finds its highest fulfillment in the National Air Service Building in Dayton.

First and chief, then, of the men you would probably meet, were you to start in from Washington for a survey of the situation, would be Newton D. Baker, Secretary of War. Secretary Baker is a busy man. He has his hands full continually, twenty-four hours of the day, directing the affairs of his department. He needs men about him who are skilled in special lines; who can relieve him of some of the responsibilities of his office. Therefore, when it came to handling the aeroplane situation (admittedly as essential an element as can possibly enter into this winning of the war), Newton D. Baker picked John D. Ryan, successful in business, possessing a keen brain for service and production. Mr. Ryan became the Director of the Air Service and Chairman of the Aircraft Board. You would probably meet both Secretary Baker and Director Ryan, who, by the way, is also assistant secretary of war, on the run. While you paused to witness the speed and rapidity with which these men work, because their business requires speed and

C. W. Nash, Assistant Director Aircraft Production, in charge of Engineering and Production

rapidity, you would run across W. C. Potter. Now Mr. Potter has been aptly designated by the press and he is known in the aeronautical work as John D. Ryan's right hand man. He is Director of Aircraft production. You will have to step some to keep up with W. C. Potter and he instills this same spirit in the minds of those who work for him. Production is his middle name, and it is his office to see that fighting ships for the armies overseas are kept constantly on the move. When production lags Mr. Potter throws on a little more steam and then production increases.

The Assistant Director of Aircraft Production, in charge of engineering and production in the Air Service Building at Dayton, is C. W. Nash.

Your visit has brought you to Dayton. If you have thought business was booming before, you are impressed the more with this thought, once you visit the Air Service Building.

Uncle Sam has picked the best, when he made up his air service personel. You are doubly impressed with this thought, once you gain admission to some of the private offices of the men who are doing the work in Dayton.

Three distinct divisions are at work now in the Air Service Building—the Engineering Division, the Production Division, and the Technical Section of the Division of Military Aeronautics. Each in its way co-operates with the other. Lieut. Col. J. C. Vincent, one of the two men credited with having developed the world marvel—the Liberty Motor, is Chief of the Aeroplane Engineering Division. The field of activity of this division extends in a particular way over the McCook Experimental Engineering Field, which is located within the Dayton city limits. Here a huge force is constantly at work. Well equipped laboratories are located here. Aeroplanes of many types and designs go through the "third degree" test here. Major H. E. Blood is chief of the Business and Military section in this division.

At the McCook Experimental Field Major H. C. Marmon is Chief. The Engineering Executive is C. H. Skinner. Captain H. H. Blee is in charge of the technical publications and library department. The field manager is Caleb Bragg, daring air pilot and formerly as well known in the automobile racing game. Bragg's record trip from the McCook Field to Washington, D. C., in two hours and 57 minutes in an aeroplane excited no end of curiosity and interest several weeks ago. The McCook Field organization long since proved its efficiency for service and has elicited favorable comment from the government in Washington.

Colonel T. H. Bane, who is Chief of the Technical Section, Division of Military Aeronautics, occupies with his departments, the two floors of the Air Service Building nearest the top. The Wilbur Wright Test Feld, located at Fairfield, east of Dayton, reports to him. It is his organization that tells the Engineering Division what type of aircraft the army needs. It tests aeroplane devices that experts develop and decides which shall be produced for the army. Once these devices and aircraft types are decided upon, the scene shifts to the Production Division which produces them.

The Master Records and Changes are kept on file at the Air Service Building in Dayton. This has been found a master stroke of business genius and has justified its introduction as a secure and safe administrative measure. As Chief of the Production Engineering work in the Air Service Building a civilian is found, J. F. McClelland, while under his jurisidiction

Lieut. Col. J. G. Vincent, Chief of Engineering, Airplane Engineering Division

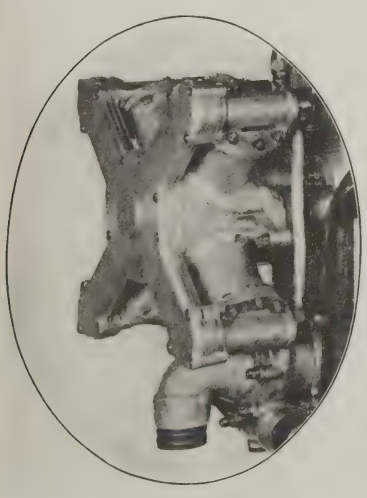
Major H. E. Blood, Chief of Business and Military Headquarters, Airplane Engineering Division

Major H. C. Marmon, Chief of Experimental Engineering Department, McCook Field, of the Airplane Engineering Division

J. F. McClellan, Chief of Production, Engineering Dept. of Airplane Engineering Division

Col. T. C. Bane, Chief of Technical Section of the Division of Military Aeronautics

is found various and diversely important offices, each having in a particular way to do with the development of the work in this division.



C. W. Nash, Assistant Director of Aircraft Production, in charge of engineering and production, is a busy man. If you don't think he is, try to see him some day at his offices in the Air Service Building. The chances are about 50 to 1 you will find he is in Buffalo, or New York or Washington or in some of the cities where production needs hustling up a bit to keep things moving overseas. Most of his time is consumed in keeping the wheels moving in the way of hastening production.

Mr. Nash was well selected for this post. His success as an industrial leader spoke eloquently of his fitness for any work that required skill and business acumen. His biographers always start with C. W. Nash and the Durant-Dort Carriage Co., in Flint, Mich. That was a good many years ago, when carriages were less of a curiosity than they are now. Along about 1909 (dates aren't of any particular value when you are writing about successful men) C. W. Nash became president of the General Motors Co., a combination of industries that proved one of the greatest ever conceived in America. It was while serving as head of the Nash Motor Co. that Mr. Nash was called into federal service. He responded without argument, even though he knew he was yielding a good paying business and a successful one. If the country needed him, his business didn't need him—this was the principle under which he planned to enter actively into government work. He has served with eminent distinction in his work for Uncle Sam. What greater tribute could you pay a man than simply that?

I must not, in passing, neglect to call attention to a thing I hastily mentioned previously—that of central control. The esentiality of this thing has not been overlooked in the organization of the Air Service, and we see it particularly emphasized in the operation of the various departments in Dayton. There is no such thing as discord here. Things have to "hitch" under the expert system employed. No one goes outside his field of activity, but these fields of activity co-operate and co-ordinate in such a masterly way that failure is negatived everywhere.

Men have been selected by the government for its air service with more than ordinary care. The general tendency has been to command the services of experts. The aeronautical division of the army development has already proved its worth. Results count most of all. The tales that come to us from overseas, telling of the briliant exploits of American airmen, send a thrill through the bodies of red-blooded Americans.

Few stop to consider the tedious path that has been trod in developing these air conquering machines that have all but pushed the German pilots out of the skies. The thought comes to us that, out of experiments, conferences, hazardous tests and even from the work-bench of the skilled workmen have come these mechanical birds that shall blaze the way for Yankee infantry and Yankee guns to the very nest of German trickery—Berlin.

The Liberty Starter

THE LIBERTY STARTER

THE Liberty Starter is an air motor and compressor in one. While acting as a starter it runs as a four cylinder air motor, cranking the aeroplane engine through a train of gears inclosed within its transmission.

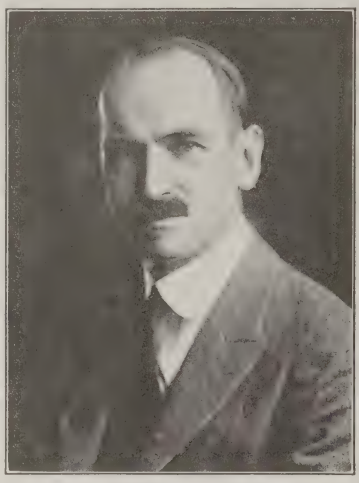
At the end of the transmission is a final drive that connects direct to the crankshaft of the engine. This drive runs continually at engine speed and operates a small pump which furnishes pressure for the gasolene feed. See cut. After starting the engine the Liberty Starter automatically disengages and remains so until needed for further use either as a starter or compressor.

In order to keep an adequate air supply in the tank the starter is engaged as a compressor by pushing a button on the control valve while the aeroplane engine is running at low speed.

When engaged the engine must be speeded up to 1,200 to 1,400 R.P.M's. At 230 pounds pressure the compressor automatically disengages. There are over nine hundred of these starters in use on planes in this country, and the U. S. Mail Service is installing them wherever possible.

Now the Liberty Starter is ready for Foreign Service. It has been thoroughly tested and in every instance has shown itself the best type of aeroplane. First, it is light, weighing but 30 lbs.; second, it is compact, measuring 8" long; third, it is efficient, cranking the aeroplane engine at 150 R.P.M.'s or more and replenishing its own energy in 30 seconds, less time than any other device known, and finally, it is simple, as there are no pipes leading to the aeroplane engine, this leaves the engine in its natural state. The tank weighs 12¼ lbs., making the complete outfit 49 pounds.

THE ENGINEERING AND BUSINESS GENIUS BACK OF THE CURTISS AEROPLANE AND MOTOR COMPANY



WE are enabled this week to give short biographical sketches of some of the men back of the Curtiss Aeroplane & Motor Company, one of the largest contract holders working with the Bureau of Aircraft Production.

John North Willys

There are two men in the automobile industry whose names and personality are as familiar to the boy and the man on the Atlantic seaboard as they are to the man and boy on the Pacific coast. One of these two men is John North Willys, the president of the Willys-Overland Company of Toledo. For many years, Mr. Willys has been esteemed as one of the most progressive automobile manufacturers. His production methods have set the pace in many respects in that enlargement of our national, social and industrial life the ever-increasing use of the motor car has brought.

Mr. Willys has recently been elected the president of the Curtiss Aeroplane & Motor Corporation as a result of the combination effected between the Curtiss Aeroplane & Motor Corporation as a result of the combination effected between the Curtiss forces and the Willys-Overland interests. The result is no less important to the immediate production of the thousands of aeroplanes now needed, than it is to the assured pre-eminence of this country in the manufacture of the flying machine the United States gave the world. There is represented in the combination a linking of the aeroplane's development in which Glenn H. Curtiss has been the leader, with the command of markets for raw materials and the enormous production facilities Mr. Willys has made possible.

Mr. Willys was born in Canandaigua, N. Y., in 1873. He had his first business experience in the bicycle industry. He conceived the idea then of reaching markets for manufacturers who were unable to reach them on their own initiative. His success as an automobile manufacturer has been based on that idea—the creation of the markets in all corners of the world with the production at home to meet the demands. After leaving Canandaigua, Mr. Willys went to Elmira and there bought the Elmira Arms Company. The automobile was barely out of the experimental stage when he organized the American Motor Car Sales Company, with headquarters in Indianapolis. In the fall of 1907,

Glenn H. Curtiss, the pioneer, still helping Uncle Sam to "put it over"

he assumed the management of the Overland Automobile Company of Indianapolis, and a few months later, in the winter of 1908, he had acquired control and assumed the presidency of the company.

That was the start of the tremendous business which now is known as theWillys-Overland interests. Markets were created. The name Overland was made as familiar as the name of the local daily newspaper. In October of that year, Mr. Willys had acquired the Marion Motor Car Company of Indianapolis, and in April, 1909, he purchased the Pope-Toledo plant in Toledo, Ohio. From that time the Overland headquarters have been Toledo. In a very few years Mr. Willys was a national figure in finance and an industrial leader of commanding force, controlling a score of industries. Certainly a series of successes measuring large for a man who is only in his forty-fifth year.

He is fond of all outdoor sports, being particularly interested in automobiling, golfing and yachting. He is a member of the leading social and sporting clubs of Toledo, and for several years has been a member of the Aero Club of America and the Society of Automobile Engineers. Mr. Willys is married and has one daughter.

Henry Manning Root

Mr. Henry Manning Root, Assistant Comptroller of the Curtiss Aeroplane & Motor Corporation, was born in Buffalo and was educated in the Buffalo Public Schools and Colgate University. He did excellent work for the International Harvester Company from 1901 to 1911, and from 1911 to 1916 he conducted a business in public accountancy. He is the First Vice-President of the Buffalo Aircraft Club and has been vitally interested in aeronautics for a number of years.

Charles B. Wilson

Mr. Charles B. Wilson is a Vice-President and the Production Manager of the Curtiss Aeroplane & Motor Corporation. He was born in Warren, Ohio, and practically his entire career has been spent in factory management positions. While with the Diamond Match Company, he designed special machinery of great value, and during his eight years' general superintendency of the Olds Motor Works of Detroit and Lansing, he gained very much valuable experience. Later he became Vice-President of the Ferro Foundry & Machine Company of Cleveland. When he disassociated himself with the Ferro Company, he went to Pontiac and organized the Wilson Foundry and Machine Company. He was sub-

James E. Kepperley, Vice President and General Manager, Curtiss Aeroplane & Motor Corporation

W. W. Moss, Comptroller, Curtiss Aeroplane & Motor Corporation

H. M. Root, Assistant Comptroller, Curtiss Aeroplane & Motor Corporation

Clifton Reeves

sequently invited by Mr. Willys to join the Curtiss Company as Special Production man, and while he is undertaking this work at Buffalo, he still retains his interest in the Wilson Foundry and Machine Company, which is now under the management of his brother, Mr. David Wilson. Mr. Wilson is a big man physically and mentally, and he is making a very definite impression in his new associations in Buffalo.

Fay Leone Faurote

Mr. Fay Leone Faurote was born at Terre Coupe, Indiana, July 26th, 1881. His father is cashier of the Niles City Bank of Niles, Mich. The ancestors of the Faurote family on the paternal side were from the French Huguenots, and on the maternal were English and Scotch. The early members were noted to have fought in all our wars, with the exception of the Mexican. A number of the progenitors were identified with railroads and other early transportation interests. They were early settlers in New York and New Jersey, later moving into the states of Michigan, Ohio, and Indiana.

Mr. Fay Leone Faurote received his education at the Niles, Michigan, high school, from which institution he graduated in 1899. In 1903, he received the Degree of Bachelor of Science in Mehcanical Engineering, at the University of Michigan, and finished his schooling with a business course at the Lansing Business College.

Fay Leone Faurote, Publicity Director of the Curtis Aeroplane & Motor Corporation

His first occupation with the commercial world was in a retail grocery establishment, at which he remained for a period of ten years. He was also an assistant to the city engineer before he took his university course. After Mr. Faurote took his degree, he worked through the shops of the Olds Motor Works as an apprentice, from which he was advanced to draftsman and assistant experimental engineer, and in 1904 he was appointed the advertising manager of the corporation. He held this position until 1908, when he resigned to take the important office of advertising manager of the E. R. Thomas Motor Co. of Buffalo, N. Y., and that position he holds at the present time.

Mr. Faurote has contributed largely to the literature regarding the automobile. He is the author of "Busy Man's Text Book on Automobiles" and "The How and Why of the Automobile," two very valuable works, and considered by "those who know" to be the best and most complete works yet issued on their respective subjects. He is also the author of "A Boy's Text Book on Gas Engines," which has had an enormous sale. Mr. Faurote is a prominent writer of many technical and automobile subjects. Independent of his extensive duties, as mentioned, he found time to be the instructor of the Detroit Motor School while in that city, and is now identified with a School of Advertising in Buffalo.

As advertising manager of the Curtiss Aeroplane & Motor Corporation, and assistant secretary of the Aircraft Manufacturers' Association, Mr. Faurote is doing constructive work for aeronautics.

Charles Matthews Manly

Mr. Charles M. Manly, Chief Inspection Engineer of the Curtiss Aeroplane & Motor Corporation, was born in Staunton, Va., in 1876. He is the son of Charles Manly, D.D., President of Furman University, Greeneville, S. C., from 1881 to 1898. His elder brother is Capt. John M. Manly, Head of the Department of English, Chicago University. His younger brother, Basil M. Manly, is at present Economic Editor of Scripps-McRae newspaper Syndicate, Washington, D. C.; on temporary leave serving with Federal Trade Commission.

Mr. Manly has been Assistant in charge of Smithsonian Institution to Dr. S. P. Langley, in development of aviation from 1898 to 1905. He is Vice-President and Chief Engineer of the Manly Drive Co., of New York City. He was Consulting Engineer, British War Office, in 1915.

He is a member of the Society of Mechanical Engineers, Society of Automotive Engineers, Aero Club of America, Buffalo Engineering Society, Cosmos Club, Washington, D. C.

Mr. Manly is joint author with Dr. S. P. Langley of Volume 27, Smithsonian Contributions to Knowledge, entitled "Memoir on Mechanical Flight."

Mr. Manly has patented some thirty or more mechanical devices in the United States and foreign countries pertaining to power generation and transmission.

Mr. Manly took charge of Dr. Langley's work in aviation at Smithsonian Institution, June, 1898, carrying on the construction of a man-carrying aeroplane which he had undertaken for the Board of Ordnance and Fortification of the War Department and continued in charge of this work until it ceased, from lack of funds, in December, 1903. Continued aviation research work from then until further lack of funds caused complete stoppage of aviation work at Smithsonian Institution in 1905.

Charles M. Manly, Chief Engineer, Curtiss Aeroplane & Motor Corporation

W. W. Moss

William Ward Moss, on February 9th, 1918, was elected a vice-president and comptroller of the Curtiss Aeroplane & Motor Corporation. For two months before his election he had served the government as examiner for the war credits board at Washington, D. C. To his new tasks, highly important in the country's war programme Mr. Moss has brought the genial enthusiasm, the same driving energy and capacity which in a short span of years had won him recognition among the bankers of the south.

Less than thirty years ago, Mr. Moss began his business career. It was shortly after his graduation from the Chester Academy in 1889 that he went to work for the Chester National Bank at Chester, Pa. From that year until 1898, Mr. Moss remained with the Chester Bank, winning promotions regularly in his chosen field. In 1898 he became the cashier of the First National Bank of Media, Pa., and five years later his ability was recognized in his election, 1903, to the presidency of the

Charles B. Wilson, Vice President and Production Manager, Curtiss Aeroplane & Motor Corporation

TEN YEARS OF HALL-SCOTT

By JAMES G. STAFFORD

OF all the startling changes in the job of making war, as we of to-day know it, the most remarkable is undoubtedly the wide use of aircraft in all purposes of attack and defense. Aircraft were scarcely beyond the stage of the aerial acrobat when the war began in August, 1914. To-day they are depended on as the eyes of the army. Upon the accuracy of the observer's reports on high, depend the timing of attack, the control of the artillery, the movement of a million men. It has come to be the most relied upon arm of the raider over the enemy's lines, and the means of disturbing his troop concentrations, industrial centers, and interior producing areas.

An Epochal Four Years

There were few in either America or Europe, when the war began, who conceived the use to which aircraft would be put. Few, who dreamed of its rapid development in the short four years since the first shot was fired at Belgrade. Consequently manufacturing facilities were few, and meagre in the extreme. All were inadequate, as contrasted with those available for the manufacture of other forms of war material. Practice, design, engineering problems were yet unsolved, or only beginning to be understood.

Successful Engine Builders for Ten Years

Aeroplane engines have been built and furnished to successful flyers for aeroplanes for more than ten years by the Hall-Scott Motor Car Company, of San Francisco, California. This concern had been engaged in this business for six years, when Europe was first deluged with its present bath of blood and fire. Hall-Scott powered planes had broken records for endurance, speed, altitude, and generally satisfactory performance and had been used extensively by Allied governments, before the United States entered the war. Our own Army and Navy Departments had tested its engines, and had found them satisfactory.

Began Building in 1908

Thus, when E. J. Hall, now Col. Hall, U. S. Aviation Service, in charge of motor work in two big factories on the fighting front in France, built his first eight cylinder "V" type engine back in 1908 for a man named English, who wanted to use it in a helicopter, it marked the establishment of the first all American aeroplane engine building business. That business has gone forward always a pace ahead of demands, until to-day its originator, chief engineer, and designer is the nation's chief dependency in the perfection of the Liberty engine.

Liberty Engine Embodies Hall-Scott Practice

It was Hall-Scott practice in all essential details, incorporated by Col. Hall in the Government's super aeroplane engine—The Liberty "Twelve"—in an unselfish effort to serve the nation in its emergency. It was Hall-Scott experience, personified in the modest unassuming, hard working Chief Engineer of the Hall-Scott Motor Car Company—Col. E. J. Hall, himself—that piloted the development of that 12 cylinder Liberty engine through its initial designing, and made possible the perfected machine of to-day. It is that same personality, modest, quiet, almost timid, sternly opposing publicity, avoiding the focalized glare of the limelight, that is solving the nation's aeroplane engine building problems in France.

First Overhead Valve Engine Hall Built

Hall-Scott was first incorporated as a company to build railroad motor cars. Previous to the time the company was organized, Bert C. Scott was Secretary of the Yreka Railroad, operating in Northwestern California, and had been engaged in searching the country for a self propelled railroad motor car. He had been unable to obtain one throughout the East. Returning to San Francisco without the necessary equipment he told his trouble to Col. Hall from whom he had purchased one of the latter's famous "Comet" racing cars with a Hall built overhead valve engine, which ran away with everything on the track and road in those early days of automobiling. Together they planned and developed the now familiar motor driven passenger car of the railroads. It proved such a success the two formed a partnership for manufacturing them. That is why the concern is known as the Hall-Scott Motor Car Company.

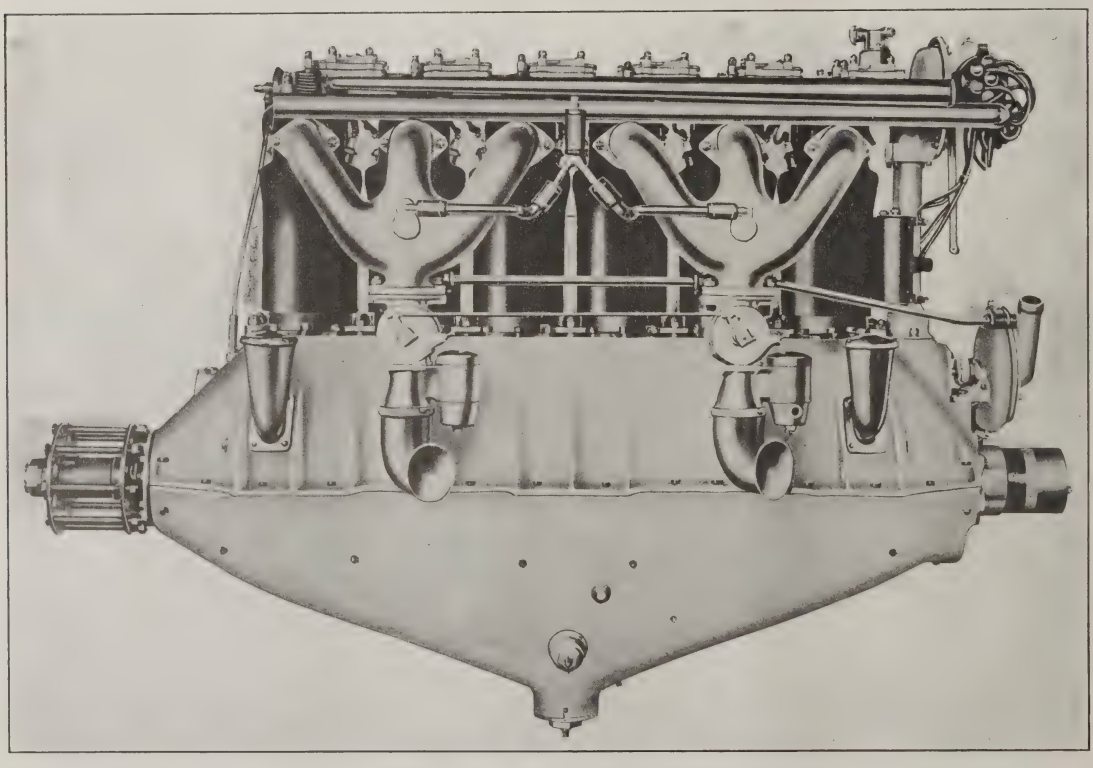
Busy on Aeroplane Engines

Considerable time elapsed before any orders were received for these motor cars. Meantime, the factory and plant at West Berkeley, California, was kept busy night and day with orders for aeroplane motors. Quite a few of the engines were sold to local aeroplane builders.

Chas. K. Hamilton came to San Francisco, in 1910, and soon became an enthusiastic Hall-Scott engine user. His first Hall-Scott engine was later turned over to John Frisbe, for use in making the Belmont Park-Mineola (New York) flight, which was considered a big feat at that time. These flights, and others by Captain Thos. Baldwin's exhibition flyers helped establish the Hall-Scott engine's reputation, which soon extended across the water, to Europe, and reached the Orient.

Los Angeles Meet Hall-Scott Powered

More than half of the planes which participated in the Second International Aeroplane meet at Los Angeles in 1912 were powered with Hall-Scott engines. The many remarkable feats of that wonderful affair were made possible by the perfection of engine functioning, already attained by the Hall-Scott power plants.



At that time the factory was turning out about fifty aeroplane engines per year—quite a large production as viewed in the light of those days. Continued improvements in the earlier engine types were being made by Col. Hall. The company finally built a larger type engine than any theretofore attempted. It was an eight cylinder, "V" with 5 inch bore, which was used by Glenn L. Martin, in competitive U. S. War Department trials at San Diego, in September, 1912. Notwithstanding some reports to the contrary, Mr. Martin and his Hall-Scott powered plane, was the only one who successfully passed all of the required tests. These trials cost the Martin Company and the Hall-Scott Company about $25,000.

Standardizes on Mercedes Type Engine

Up to that time the Hall-Scott company had expended more than $37,000 on the 8-cylinder "V" type engine, when on the return from San Diego of Col. Hall, it was decided this type engine was not a satisfactory proposition, he advised discarding it entirely, and the building of a verticle six cylinder engine of the Mercedes type.

Russia Orders Three Hundred

Completion of this engine, and tests before the Automobile Club of America in New York City,

The new L-6 six cylinder Hall-Scott motor, showing the intake side, with the interchangeable steel cylinders. In recent tests it developed 212.6 h.p. at 1666 r.p.m. It weighs 502 pounds.

and in actual and thorough flying tests in the Martin planes and in the Sloan plane, designed by C. H. Day, proved it was such a remarkable success, that an order for three hundred was placed with the Hall-Scott Company by the Russian Government. These were manufactured under the mos rigid Government inspection at the West Berkeley plant, and completed with deliveries in full thirty days ahead of the contract date. This was the first actual war order received by the company. It was really the only concern in the United States in a position, with the perfected engine, the engineering organization, and the completely equipped factory, to accept such an order, and carry it through on schedule.

Large Sums Into Experiments

Improvements in this original six cylinder type engine, increasing its horsepower rating from 130 to 160, adding improvements and refinements, through the reduction in weight per horsepower, etc., called for additional expenditures of large sums in experimental work. The company also built a 4 cylinder equipment, which was adopted and proved satisfactory for primary and advanced training plane work.

Expanding Factory Facilities

The plant at West Berkeley, where Col. Hall and B. C. Scott began manufacture of aeroplane engines, as a partnership, in March, 1910, soon expanded with the demands for the Hall-Scott engines. The company was incorporated on Feb. 8, 1914, with a capital stock of $100,000. It was and remains a close corporation, with E. J. Hall, B. C. Scott, and L. S. Scott as the sole stockholders. It started with a paid up capital of $23,000. Its first dividend was paid last year, all previous earnings having gone into experimental work, equipment, and improvements. The plant at West Berkeley, California, is now actually worth, with stock on hand, $1,000,000.

Out With New Six-Cylinder Engine

To-day Hall-Scott has brought out a new six cylinder aeroplane engine that marks another big step in design, and also in Hall-Scott progress. It is distinctly in line with the best thought of the day as regards aeroplane power plants. Announcement of its new "L-6" type, six-cylinder 200 horse power engine was made early this year by the Hall-Scott Motor Car Company. Government tests were completed this summer, and those, together with comparison with tests records of their earlier types of six-cylinder engines of the

Col. E. J. Hall, of the Hall-Scott Motor Co.

A-5 and A-5a Models, point to the fact that the new L-6 type is almost the ideal for either single or twin motored planes.

Accepted for Navy Department

The L-6 engine tested by George R. Ross, government inspector at the West Berkeley, California, plant of the company, developed 212.6 H.P. at 1666 R.P.M., and weighed 502 pounds. This is equivalent to 2.36 pounds per B.H.P. Inspector Ross passed the tests as satisfactory, and purchased the engine for the Navy Department, for which he was acting. Notable points of comparison, marking the advance of the L-6 type, contrasted with the A-5 and A-5a, which developed at best only 160 H.P. is found in the weight. In the L-6, it is 2.36 pounds while with the A-5a, which developed at best only 160 H.P. it is 3.75 pounds. Much of this reduction in weight is of course possible through the substitution of steel cylinders.

Uses Steel Cylinders

Due to the increased strength of the steel cylinders, interchangeable, throughout the entire series of Hall-Scott engines, it is possible to have higher compression pressure, and higher thermal temperatures. Considering the greater volumetric efficienty of this engine, the fuel consumption of .55 pounds per h.p. hour, is no greater than in the older type engines.

Ideal Engine for Twin Power Plants

Planes powered with this L-6 engine in duplicate, or even as a three engined flyer, seem to offer the solution of the easily operated, controlled, and efficient flying craft. With either engine alone there is power enough to maintain a remarkable speed, and with the perfection in design of aeroplanes, such as attained already in such flyers as the Loughead flying boat, which is powered with two A-5 Hall-Scott aeroplane engines, little difficulty in control is experienced in case of one only being used. With two such engines in operation such a heavy plane as the Loughead flying boat is capable of considerably more than 100 miles per hour.

Most Logical for Reserve Power

The twin engined plane is far more dependable as a bomber, or as a mail carrying plane than any single engined plane of whatever type. There is always a power reserve for extra speed, when necessary. In the case of disablement of one engine while in the air, the plane can continue flying until either its mission is accomplished, its mail delivered, or a suitable landing place reached, where repair work can be done. With two power plants of ample size, such as furnished by the L-6, 220 H.P. Hall-Scott aeroplane engine, an almost indefinite life for the engines is assured, because neither would be flown with wide open throttle, as is the case with many of the single engined planes. These in order to maintain speed, and climbing ability, must be run at wracking engine speed. It is said this use of only two-thirds or three-quarters of the engine throttle, and consequently engine power, is the secret of the long life of the German aeroplane engines, as contrasted with the remarkably short lived Allied Engines.

AIR DIVISION DISCOVERS WEALTH OF SURPLUS AND UNUSED MATERIALS

The war Department authorizes the following:

The Division of Military Aeronautics has turned up since August 6 a surplus of supplies worth $10,000,000 and its examiners have not yet finished their task. These supplies already listed include typewriters, motor cars, motor trucks, oil, lumber, wood, iron, and steel working machines, motorcycles, building material, aeroplanes, and about everything in the accessory line from screw eyes to stove bolts.

The official name of this system, which has begun to conserve supplies, is the Surplus Inactive Supplies Service, Purchase and Storage Branch, Purchase, Storage and Traffic Division of the General Staff. It has branches in most all bureaus of the War Department, the object being to utilize duplicate supplies purchased through the unavoidable lack of organization in the emergency and rush at the beginning of the war. These surplus supplies, as fast as they are found, are listed and through a system of trade, transfer and sale either put to use in the department or sold in the public market.

Within its own division, since August 15, Military Aeronautics has sent out lists of 1,200 different surplus items, including more than 50,000 separate units, amounting in value to over $3,000,000. Each of the seventy-five branches in this division was asked what articles, if any, it wanted, and so far 532 orders for over 30,000 separate units at a value of $750,000 has been returned calling for some of this surplus material. The work of transferring this material from those who do not want it to those sub-divisions who do is now under way, and this readjustment will continue until the total supply of all branches is reduced to stock on hand sufficient for three months in advance.

Already the Division of Military Aeronautics has turned over to the Surplus Inactive Supplies Service of the General Staff property amounting to $2,087,341.35 which none of its own branches could use. Some of the larger items on this list were 150,000 gallons of oil worth $75,000; 417 typewriters valued at $25,000; 200 tons of hay valued at $3,000.

Another and different class of surplus supplies now being inventoried for turning over to the Surplus Inactive Supplies Service of the General Staff includes parts for 3,500 French Gnome aeroplane motors listed at the time they were ordered in this country by the French High Commission, $10,500,000, but which now must be sold as junk for from $25.00 to $120,000 a ton. There are 2,000 tons of these motor parts. This motor was at one time one of the most popular motors in France, but now, owing to the rapid advance in design and construction, the type is becoming obsolete. Very few of these motor parts are finished. Some are yet in steel billets; some are finished as high as 90%; some as low as 5%; some have been boxed and sent across seas. All will now have to be scrapped. Eventually they will be paid for by the French Government, the money to buy them having been advanced by the United States.

With these Gnome motors will go 300 Penguin training planes worth $750,000, a type that is now obsolete, and 128 L.W.F. aeroplanes worth approximately $1,427,000. In this collection will also appear 1,500 J.N.1 aeroplanes valued at $9,000,000 but now obsolete, and 500 additional motors valued at $750,000. It is hoped, however, to utilize these 2,000 motors as engines in submarine chasers and coast patrol boats. The 1,500 planes may also be utilized if a suitable engine is ever developed for them.

Among other surplus material found by the Division of Military Aeronautics and immediately put to use was 4,500,000 feet of ⅜ inch rope. The present demand for rope is exceedingly great and specifications were changed in order to take advantage of this "find." Three-eighths inch rope was substituted for ¼ inch rope required and the 4,500,000 feet put into equipment for squadrons overseas, effecting a saving in this instance alone of $75,000.

Another consignment of goods located and immediately put to use was 500 pairs of field glasses worth $37,500. This was found in a supply depot at Omaha. Other emergency supplies to the value of $75,000 were discovered in this same station and immediately shipped overseas.

At the Middletown, Pennsylvania, depot, 9,000 gallons of "dope," a preparation for wing fabric in aeroplane construction and worth $47,500, was discovered and immediately put into use.

Other surplus supplies located included seven carloads of iron, steel, and wood working machinery found in a supply depot at Hampton, Virginia. In one of these cars was a wire testing machine badly wanted in France. Incidentally, 5,000 steel drums wanted for oil containers were discovered in private storage. While they were not the property of the Government, nevertheless they were put into immediate use and the owner paid for them afterwards.

Another saving made by these conservation officers was due to the fact that electric batteries deteriorate rapidly when packed in bulk, becoming practically worthless for issue after two months' storage. In the past it has apparently been the custom to purchase these batteries in great quantities. The price paid was 40 cents apiece. Conservation officers on August 27 found at the New York Supply Depot 150,000 of these batteries and it was estimated 75,000 of them, costing about $30,000, would be practically worthless when the time came to use them. Manufacturers have now been instructed to ship these batteries in bulk directly overseas only upon emergency order, which will insure quick transportation and quick use, and will, it is believed, eliminate about 90% of the battery losses and trouble.

(*Continued from page 299*)

Virginia-Carolina Trust Company of Norfolk, Va. The next year Mr. Moss became the president of the Citizens Bank of Norfolk. Four years later, in 1908, Mr. Moss left the Citizens Bank to become the senior partner in the firm of Moss & Moss, Bankers, of Norfolk, Va., and for nearly ten years he worked assiduously, increasing the success and the prestige of that banking house.

In December, 1917, Mr. Moss left his home in Norfolk to give the government the benefit of his banking experience and in Washington he was an examiner for the war credits board. He was acting in that capacity when he became an executive officer of the Curtiss Aeroplane & Motor Corporation.

Mr. Moss is a veteran of the Spanish-American War. During the years he lived in Pennsylvania, he had served five years in the national guard of that State. When war with Spain broke out Mr. Moss gave up his business interests to serve as a first lieutenant of the Sixth Pennsylvania Volunteer Infantry.

Two of his sons are now with the colors. Robinson M. Moss is a student aviator in the United States naval forces. James A. Moss is in active service in France with the mosquito fleet of the United States Navy. Mr. Moss has six children. One daughter is married, Mrs. S. T. Northern, and her home is in Baltimore, Md. And there are two grandchildren who are the special pride of the family.

Mr. Moss was born in Chester, Pa., October 26, 1869. There his mother lives now. He attended the public country schools and prepared for the Chester Academy at Oak Grove school in North Chester, Pa. He is a member of the Penn Club of Chester, Pa., the Virginia Club, of Norfolk, Va., and the Norfolk Country Club.

Clifton Reeves

Clifton Reeves was born in Tuckahoe, Cape May County, New Jersey, September 8th, 1876. He attended the public school of Tuckahoe and took a special course at the School of Commerce of the Wharton School of the University of Pennsylvania, in 1911 and 1912. At the age of 14 he built a stationary engine that attracted the attention of the officials of the Reading Railway, which afterwards led to his becoming an apprentice in the Baldwin Locomotive Works. From there he was made one of the Master Mechanics of the Reading System.

Subsequently he invented, patented, and built the so-called Reeves Engine that has proven its mechanical superiority in many of the largest industrial and public service plants in New York, New Jersey, Pennsylvania, Delaware, Maryland, and District of Columbia, as well as in many cities in the West, and it is also in service at Princeton University, Cornell, and elsewhere. It was selected by the Pennsylvania Railroad, in competition with all the other engines in the United States, for work in the East River tunnels, and was used there exclusively. It is in use also in a number of government vessels for lighting and similar purposes, and is in service in the District of Columbia Filtration Plant and in the Torresdale Filtration Plant of Philadelphia, the latter the largest institution of its kind in the world. Mr. Reeves, individually, designed these engines. He is the President and General Manager of the Reeves-Cubberley Engine Company of Trenton, and the President of the Reeves Foundry Company, of Trenton.

He organized the Manufacturers and Employers' Association of Trenton, which was afterwards merged with the reorganized Chamber of Commerce; was a Director of the Trenton, Lawrenceville & Princeton Railway during the course of its construction and until the time of its taking over by the Johnson interest; Secretary of the Trenton Association of Machinists and it was in recognition of his fairness in the settlement of a machinist strike in Trenton, in which his company was involved, that he was selected by Secretary Wilson as a member of the Board of Conciliation, of the Department of Labor. His work there speaks for itself, but special mention should be made of his connection with the threatened strike of the traffic clerks on the New Haven Railroad and his activities in connection with the settlement of the Westinghouse strike in Pittsburgh, involving some 86,000 men. The approval of Mr. Reeves' appointment to the Conciliation Board was evidenced in the widespread publicity it received throughout the country, particularly in the technical journals and more important trade papers.

He was appointed, in 1914, by Governor Fielder, of New Jersey, as a member of the Board of Trustees of the School of Industrial Arts, in Trenton, succeeding the late Judge Garrett D. W. Vroom, for which institution he wrote sometime ago an article on the value of industrial training that was widely copied and commented on throughout the country. He is a member of the American Society of Mechanical Engineers; of the National Civics Association; of the Masonic Fraternity (32nd degree); the Engineers Club; the Rotary Club and a Trustee and Deacon in the Central Baptist Church, in Trenton.

He married Miss Elizabeth Hunt, of New Hope, Pa., and has one son, Norman Reeves.

THE ST. LOUIS AIRCRAFT CORPORATION

Mr. A. J. Siegel is the President of the Huttig Sash & Door Company of St. Louis and also the President of the St. Louis Aircraft Corporation of this city.

The St. Louis Aircraft Corporation has a contract with the United States Government for the manufacture of aeroplanes, and the Huttig Sash & Door Company are making all of the wood parts and doing the minor assembling, while the St. Louis Car Company, also of St. Louis, are doing the assembling of the fuselages.

The Huttig Sash & Door Company is one of the largest woodworking plants in America. It has a floor space of very nearly 500,000 square feet and the plant covers a ground area of seven acres. The company was organized in 1885, and ever since has been engaged exclusively in the production of the most perfect millwork possible to manufacture. Consequently the plant was especially well adapted to the manufacture of aeroplanes in a prompt and accurate manner, and the work of making aeroplanes has been carried through by the St. Louis Aircraft Corportation, the Huttig Sash & Door Company and the St. Louis Car Company in a most efficient way.

A. J. Siegel, President Huttig Sash & Door Co. and St. Louis Aircraft Corporation

In the manufacture of aeroplanes there was one big item that had to be considered, and that was obtaining men who were familiar with the production of the article. The organization of the Huttig Sash & Door Company was highly efficient, and in consequence the production of aeroplanes was not delayed but went right ahead from the very start and has kept up to a very satisfactory figure. In the plant they are employing women on various parts of the work of making aeroplanes. They have proven efficient in that they are very painstaking, very earnest and take especial pride in turning out nice work.

Mr. A. J. Siegel is a director in the Third National Bank of St. Louis and Vice-President of the Manchester Bank of St. Louis. He has given a great part of his time, thought and energy to war activities, such as the Red Cross, Y. M. C. A., Knights of Columbus, and the sale of Liberty Bonds. Mr. Siegel is also chairman of the St. Louis district of the War Service Committee, Millwork Industry.

AEROMARINE DEVELOPMENT A MONUMENT TO INGLIS M. UPPERCU

THE Aeromarine Plane and Motor Company of Keyport, New Jersey, a division of the Detroit Cadillac Motor Car Company of New York, is one of the pioneers of aircraft manufacture. It is one of the few companies equipped for quantity production at the time this country entered the war. Specializing in seaplanes, this company has made an enviable record in the manufacture of single and double pontoon hydroaeroplanes and flying boats.

Inglis M. Uppercu, President of the Aeromarine Plane and Motor Company

The officers of the company and the workmen in the Aeromarine plant are justly proud of the fact that more machines have been turned out there per man-power than in any other aircraft factory; that Aeromarine machines are in continuous service, and that not a single life has been lost through faulty construction.

It was in 1908, the year the Wrights astounded the world by their flights at Fort Myer, that the seed of the Aeromarine company was sown with the formation of the Poland Aeroplane Company of Newark. Inglis M. Uppercu, president of the Aeromarine Plane and Motor Company, financed the Boland concern, and it was Mr. Uppercu who furnished the money, the courage and the enthusiasm during all those lean years that followed, in which the government offered no encouragement to aircraft manufacturers. During this time the laboratory work was continued, along with plant enlargements which enabled the Aeromarine company to place at the disposal of the government a large and efficient plant equipped for quantity production at the time such plants were needed most and sadly lacking in number.

In ten years the enterprise in its evolution has expanded from a wee laboratory to one of the best appointed and equipped plants of its kind in the country. Every device for testing strength of material, testing the strength, power and durability of motors are installed. The motor testing room is acknowledged one of the best in the world.

The plant is ideally situated on Raritan Bay with a water frontage of 3,200 feet and a splendid flying field. It is ten miels from Sandy Hook and eighteen miles by water from New York City. To the Naval Training Station at Bay Shore it is fifty-two miles, and forty miles to the Mineola flying field, which has enabled the aerial delivery of training machines to these stations of machines built at the Aeromarine factory, a potent factor in the speed-up program of this country's war work.

From the time of its inception the company has built its machines in their entirety, including engines and propellers, though in filling war contracts the machines have, of course, been from government specifications. But despite the press of war orders the laboratory work has never been allowed to lag, with the result that the Aeromarine company has produced two engines, known as the "B" type and "L" type, that compare favorably with the best motors of foreign and American manufacture.

The Aeromarine company was eliminated from participating in the manufacture of land machines early in the war as a direct result of the superiority of the Aeromarine pontoons and the general efficiency of the Aeromarine type hydro-aeroplanes. The Navy Department placed orders that precluded any attempt to manufacture the M I army machines, which had successfully passed the government tests.

Like all aircraft manufacturers, the Aeromarine company was retarded through changes in specifications during the earlier days of the war, but for more than a year there has been a steady delivery of machines to the Navy Department. It may be said that the Aeromarine company was more fortunate in respect to changes in oontracts and specifications than the majority of the manufacturers.

The weight of the Aeromarine hydro-aeroplanes in relation to lifting power of motors with which they were equipped offered a distinct advantage for training purposes which won distinction in the Navy Department. These machines were not subject to weather conditions, leaving the water under any and all conditions, which made continuous training possible at the naval training schools, a factor of vast importance in the curriculum of naval training.

The history of the company is one of tragedy, romance and perseverance of a nature that rarely enters into the prosaic life of mechanical industry. The first product, a tail-less, rudderless machine without wing warps, was flown successfully in the fall of 1908. This model, designed by Frank Boland and built by Mr. Uppercu and Joseph Boland, was controlled by jibs and elevator. Two years later, in a model embracing the same principles, Frank Boland lost his life in a flight at Trinidad, following a series of successful demonstrations in various countries of Central and South America.

Following the death of Frank Boland years of laboratory work followed in which land and

Charles F. Willard, Chief Engineer

seaplane development progressed. This period was marked by costly experimenting with various types of machines and engines.

Before the Aeromarine company received its initial order from the government Mr. Uppercu decided to change the location of the plant to a site where unlimited expansion would be possible, and the Keyport location was selected. At no time since the first building at Keyport was completed has there not been more structures under way, but with the best effort to keep pace with the demands of production it has been necessary to purchase or rent buildings elsewhere.

Mr. Uppercu was one of the few who saw a future for aircraft manufacture in this country and he is one of the most enthusiastic regarding the future of the industry for a product designed for commercial and pleasure purposes. It is that faith that actuated him in continuing laboratory work in all departures of land and sea machines, in constructing permanent buildings and the purchase of land sufficient to meet all needs of the future.

Two views of the interior of the Aeromarine factory at Keyport, New Jersey

CHARLES HEALEY DAY,
CHIEF ENGINEER AND DESIGNER.

HARRY BOWERS MINGLE,
PRESIDENT.

DANIEL L. MEENAN, JR.
TREASURER.

THE STANDARD AIRCRAFT CORPORATION—BUILDERS OF BOMBERS

FROM the Standard Aircraft Corporation's factory at Elizabeth, New Jersey, have come during the past few months the first examples of American constructed bombing machines. On July 4 was launched the first Amercian-built Caproni, a biplane, equipped with three Liberty motors. On July 6 was launched the first American-built Handley Page, also a biplane, equipped with two Liberty motors. Both machines were built by the Standard Aircraft Corporation. In both cases the tests were successful and we can anticipate that in the near future bombing machines of these types will be turned out in large numbers, and that America will truly begin to be a substantial help to the Allies, aeronautically, just as we have been of great assistance to the Allies in connection with land operations.

The Launching of the Caproni

The final test flight of the Caproni biplane and the handing of the machine over to the Government took place at the Government Aviation Field at Mineola, Long Island, on the morning of July 4th. There was no formality about it. The plane had had its engines installed at the aviation field and when this had been completed and the engines tuned up, Lieutenant Gino, who met his death only a few days later, stepped into the plane and took her into the air for its final test. The machine had been tested several times previously. The performance of the plane is said to have been entirely satisfactory both to the builders, the representatives of the Italian firm, and to the representatives of the Government. The figures as to height and speed are not available at the present time.

Major Tappi, head of the Italian aviation mission to this country, and Major Falchi, of the Italian air forces, represented their country at the experimental flight. Mr. John D. Ryan, Director of Aircraft Production, and General William L. Kenly, Director of Military Aeronautics, and Colonel H. H. Arnold, W. C. Potter of the Aircraft Board, Captain Harvey of the administrative staff of the Mineola aviation field, and Majors Rhinehart and Canady were present at the launching. Captain Hugo d'Annunzio and Lieutenant Belloni represented the Caproni company. Commander Briggs represented the Britsh Government.

Alan R. Hawley, president of the Aero Club of America, said:

"The success of the first American built battleplane is one of the most important steps forward in the building of our air fleet."

In connection with the flight, a cablegram was made public, which was recently received by the Italian mission from Captain Fiorello La Guardia, Congresman from New York, who joined the American aviation forces and is now in Italy. Captain La Guardia appeals for the dispatch to Italy of raw materials for the building of aircraft. After expressing his good wishes for the success of the Italian mission he says:

"Please urge the American Government to send to Italy raw materials with which to build aeroplanes. The new type of Caproni war 'plane is a powerful machine, and its success has been proved in the flight from Turin to Rome, in which I participated. Give us raw materials and we will build thousands of aeroplanes here, and our American boys can whip the enemy off the map."

The Launching of the Handley Page

The giant Handley-Page, with a wing spread of 100 feet and driven by twin Liberty motors of 400 horsepower each, took the air at 4:30.

Without its cargo of bombs, the machine weighs 9,000 pounds, or four and one-half tons, and to drive it requires fuel consumption of approximately sixty gallons an hour. The Liberty motors are in an armored compartment on either side of the fuselage. In addition to its bombs, the machine also mounts two light Browning machine guns, which can be fired from any desired angle.

Benjamin L. Williams, of the Standard Aircraft Corporation

The pilot was Lord William Semphill, of the British service, and the man who sat in the machine gunner's seat forward was Major General William L. Kenly, U. S. A., Chief of the Department of Military Aeronautics in Washington. The others in the aeroplane were Captain E. T. Waller, of the Canadian Army; Captain E. L. Austin, of the Royal Flying Corps; Young B. Dawkins, an official of the Standard Aircraft Corporation, and an official moving-picture photographer.

Christened "The Langley"

The aeroplane was christened in honor of Longley by Mrs. Harry Bowers Mingle, wife of the President of the Standard Aircraft Corporation.

After leaving the ground at 4:30 the plane made three wide circles, climbing higher each time. It landed at 4:52. Colonel Semphill said it reached a height of 3,500 feet and maintained an average speed of ninety miles an hour.

The "launching" and test were preceded by a luncheon at the plant, to which several hundred guests were invited. Secretaries Daniels and Baker were invited, but were unable to attend. Benedict Crowell, First Assitant Secretary of War, represented the War Department. Senator J. J. Frelinghuysen of New Jersey and Senator Charles S. Thomas of Colorado also were present.

Columbia Aviator Cited for Bravery

Paris.—Columbia University's Paris bureau on October 4 got news of an exploit by Lieutenant C. L. Nelson of the class of 1916, who distinguished himself in the St. Mihiel offensive. Between the 12th and the 14th of September he brought down a sausage balloon, which fell in flames in a wood inside the German lines. The wood shortly afterward was captured by Americans and the destruction of the balloon authenticated.

Another day Lieutenant Nelson went out with his French escadrille of eight planes. They were attacked by sixteen planes of the "tango circus," formerly led by Baron von Richthofen. Every man of the enemy squadron was an ace.

Our escadrille lost one plane, while the enemy lost three, of which Nelson bagged one. When the fight was over his observer was shot through the leg. Nelson himself escaped with a whole skin, but with a bullet hole through the back of his boot and twenty-one bullet-holes in his machine. Despite this he descended safely within our lines. The fight lasted fifteen minutes, or "about as long," said Nelson, "as one cares to spend in a single scrap with boches."

As a reward for this achievement the whole escadrille was cited and got the Fourragère. Lieutenant Nelson was individually cited for the Croix de Guerre, and both he and his observer were recommended for the Cross of the Legion of Honor.

DEVELOPMENT OF THE WRIGHT-MARTIN COMPANY

THE Wright-Martin Aircraft Corporation, who have been manufacturing Hispano-Suisa motors for the French and British Governments for some time, have recently been forced to enlarge their working space to a great extent. They have been allotted a very important part in the aerial programme of all the Allied armies. At the present time they are standing behind very materially larger orders than was the case a year ago. At that time they were working well up to capacity. The company is making every effort to live up to and exceed the programme of deliveries to which they have committed themselves, at the request of the Government. So well were they carrying out their schedule that they were only three days behind in their deliveries up till July. The congestion of freight movements and the movements of troops and such things of paramount urgency played havoc with the company's well-arranged plans so that they are now about thirty days behind their schedule. After the receipt of General Pershing's cable asking for motors at once, the Wright-Martin company have committed themselves to the task of not only keeping up production, but to repair the damage to the schedule, so that before the expiring of the present contracts the final motor will be delivered on the original date set.

The Wright-Martin company now have a factory in Long Island City which will ultimately employ 10,000 to 15,000 men. In their plant at New Brunswick, N. J., at the present time there are employed over six thousand men. Wright-Martin have added the name of the Franklin Motor Car plant to the already long list of plants making parts for the Hispano-Suiza. The Pierce-Arrow Company are also in the Hispano-Suiza field, under the guidance of Mr. Geo. H. Houston, who is the backbone of the Hispano-Suiza programme in the United States.

The Hispano-Suiza motor added to its many laurels a few days ago when a plane equipped with a 300-h.p. Hispano-Suiza motor broke the hitherto existing world's record for altitude. In discussing the motor, one of the officials of the Wright-Martin Company said: "The ideal plane for the Hispano-Suiza motor has not been designed yet. The motor is the "Roamer" of the aeroplane field. It is built primarily for speed and lightness, and for that reason a great many of the Allied 'Aces' prefer the Hispano-Suiza in their bullet-like scouts; for that reason every French Ace uses a Hispano-Suiza motor in his Spads." As a truck horse is lost when it is put upon a rack track, so is a race horse all but useless when it is asked to move a heavy truck. So it is with the Hispano-Suiza motor. Why should a Hispano-Suiza, which will drive a plane at 145 miles per hour on the level be wasted on a heavy bombing plane when it would be of so much more use in a light, fast, fighting scout?"

THE HASLER REVOLUTION CIRCUMFERENCE AND CUTTING SPEEDS INDICATOR

A NEW revolution circumference and cutting speed indicator is being placed on the American market now by Harrah & Co., 42 Cliff Street, New York, as agents for the Hasler Co., of Bern, Switzerland.

The novelty of the instrument consists in its mechanism, the instrument operating without winding or by means of magnetism. Clockwork in the interior of the instrument automatically sets the indicating mechanism when the instrument is started and releases the same after three seconds. During this period the indicating mechanism is in direct communication with the driving shaft of the instrument, thus providing an exact record in a shorter unit of time than it would be possible with tachometers based on the centrifugal or magnetic principle.

The instrument is anti-magnetic, which permits its use freely in electric power stations.

The driving shaft can be rotated in either direction, the instrument registering any number of revolutions up to 10,000 with equal accuracy. On account of its mechanical construction the instrument is independent of the variable stresses of the springs or friction of the bearings, and can be pressed firmly on the moving body without affecting the time element.

It is not affected by vibration or temperatures, and the pointers remain at the figures arrived at until reset.

The instrument has a black circle of figures for reading revolutions, and a red circle for reading cutting speeds and yards per minute.

TITANINE DEVELOPMENT

Mr. E. G. Davis, American Manager of Titanine, Inc.

Titanine, Inc., is an American corporation, organized to manufacture Titanine formulas in America under license of the Titanine, Ltd. The latter is one of the largest manufacturers of dope in England, and has supplied about twenty per cent. of the dope used by the Allies during the war. To this company the aeronautic industry is indebted as Titanine was the first to manufacture a non-poisonous and non-inflammable dope. It is the invention of T. W. H. Ward, S. E. Groves, and Dr. J. G. Ward.

The American corporation has a large, well-equipped plant at Union, New Jersey, which is under the management of E. G. Davis, who recently came from the Titanine, Ltd., of England, to take care of the production in this country. Mr. Davis has made great strides in getting his American plant into production, and announced last week that he is now ready to furnish, in addition to Titanine dope and Planoline fireproofing sōlution, clear wing varnish and identification paints for insignia in red, white, blue, black, admiralty gray; khaki varnish and dope resistant paint. Four grades of dope are ready to be supplied, one of which is made from material not conserved by the government.

Mr. T. W. H. Ward, the inventor of Titanine

WOODWORKING MACHINES FOR AEROPLANE PARTS

THE manufacture of aeroplanes in this country created a demand for a number of special machines to make the necessary woodwork. While some of the aeroplane structure could be made on the standard machines, there are parts of such peculiar shape and design that it necessitated the making of special fixtures or equipment to use in connection with the standard machine.

In the early stages of aeroplane production there was a call for a machine that would shape a particular part of the aeroplane, called the strut. The only method of making these struts up to that time was to work them out by hand, which not only took considerable time, something like two to four hours for each strut, but it required a skillful workman to finish them to the measurements specified by the designer.

To meet this request of the aeroplane builders, many manufacturers of woodworking machines tried to develop and build a machine that would produce these parts automatically. Realizing the fact that a fixture or equipment that could be applied to a standard woodworking machine, with which many woodworkers were familiar, would appeal to the aircraft manufacturers, Baxter D. Whitney & Sons, Winchendon, Mass., manufacturers of woodworking machines, designed a jig, or fixture, for a double spindle shaper. While this jig, or fixture, was original (a basic patent has been granted on this feature), it proved its efficiency from the beginning. With the use of this fixture many leading manufacturers have been able to produce struts at a rate which, three or four years ago, was considered impossible; in fact, the capacity of this machine is only limited by the endurance of the operator.

The only preparation which the stock required was cutting it to the proper length, planed to an even thickness, and sawed to the proper width. The surplus stock was then removed by the band saw, after which it was brought directly to the shaper, and when through with this operation it was of the proper shape and size and practically ready for the fittings. As the wood was worked with the grain, it had a surface equal to the surface left by the cabinet planer, which required a minimum amount of sanding.

The success of the Whitney Company in developing this machine prompted them to supply a demand for a machine which would cut the lightening holes on the aeroplane webs. The old method required a number of operations, such as boring with a bit a hole through which a jig saw could be inserted, and the balance of the cut being made with a jig saw and afterwards smoothed or worked to size on a spindle shaper.

By designing a machine on which the spindles (equipped with a special top and side cutting tool) are raised and lowered by foot power, the number of operations on these aeroplane webs was reduced from three (3) to one (1) operation. This machine, simple in design, embodying no new features except perhaps a new application, has proved to be one of the most economical and efficient tools used in the manufacture of aeroplane woodwork.

This class of work required a machine on which the cutters ran at extremely high speeds, which could only be obtained by means of a motor, the rotor of which is mounted directly on the spindle. By this method of driving the spindles, a speed of 10,000 R.P.M. can be maintained, while it is not practical to try to maintain such high speeds on the belt driven shaper.

Another machine made by the Whitney Company used in aeroplane work is the toothing machine. By passing the sections used in the making of aeroplane propellers through this machine at a rate of 100 feet per minute, a toothed or combed surface is produced that makes better glue joints and more of them in less time than any other method.

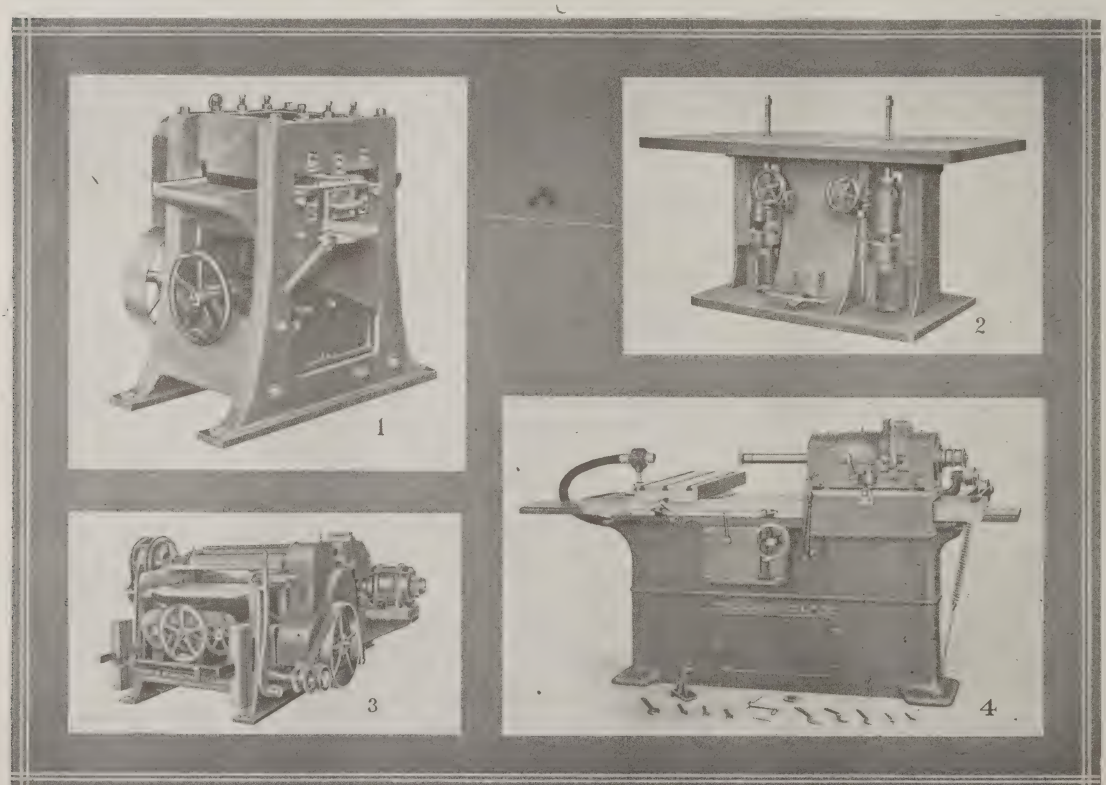
In addition to the machines this company makes for the working of wooden aeroplane parts, they also manufacture a cylinder grinding machine that is especially designed to do the internal grinding or finishing of Liberty motors.

INSIGNIA PRESCRIBED FOR AIR SERVICE

OFFICIAL specifications regarding uniforms, insignias and hat cords to be worn by enlisted men in the Air Service have come from the office of Director of Military Aeronautics, Washington, D. C. Attention is called to the regulations which specify that all enlisted men, including candidates for commissions, will wear as a part of their uniforms the blue shoulder cap as described in Special Regulations previously issued and which read as follows:

"Enlisted men of the Air Service shall have a navy blue cap let in at the sleeve head seam and extending down the sleeve 5½ inches from the point of the shoulder. All men as hereinafter specified will wear the insignia as described:

"A four-bladed propeller with center 3¾ inches from point of shoulder embroidered in white; the propeller to be two inches in diameter, two of the blades horizontal and the other two vertical; three-quarters inch above the top tip of the vertical propeller a figure showing the number of the squadron to which the man belongs, one inch high and embroidered in white.



"Aviation Mechanic—Same as above with embroidered circle added, inside of circle to be 1¼ inches from center of propellers, outside of circle to be 1⅜ inches from the center of the propellers.

"Enlisted Aviator—On same blue background shall be embroidered in white the insignia as hereinafter described:

"A pair of wings with a 5-inch spread with crossed propellers between them, each wing to be 1⅞ inches long and ⅞ inch high at the inner edge. Propellers to be one inch across. One-fourth inch above the top of the vertical propeller shall be embroidered the number of the squadron to which the man belongs in figures ½ inch high.

"In the case of candidates for a commission, under instruction in Air Service flying schools, the propeller only will appear upon the shoulder cap, no squadron number or other device to be added. There is no authority for the wearing by enlisted men of the Air Service of any sleeve insignia other than the blue shoulder cap above described, except the specified insignia of grade for non-commissioned officers, and the special chevrons for wounds and war service.

"The hat cord to be worn by all enlisted men of the Air Service, including candidates for commission, will be green piped with black."

1—Grinding machine for aeroplane cylinders. 2—Double surfacer for planing aeroplane woodwork. 3—Double spindle shaper for aeroplane struts. 4—Toothing machine for propeller blade stock.

LT. RALPH E. de CASTRO, ASSOCIATE EDITOR OF AERIAL AGE, CITED FOR BRAVERY

WORD has been received that for the second time he has been recommended for promotion and for the French War Cross for bravery in the aviation service abroad.

Lieutenant De Castro, who has been at the front since last July, has been mentioned in an official communication from the headquarters of the First Aero Squadron, United States Air Service, to the commanding general, First Army Corps. The communication reads:

"On September 7, 1918, Lieutenant De Castro, pilot, and Lieutenant A. E. Easterbrook, observer, First Aero Squadron, were sent on a photographic mission covering a strip of fifteen kilometers, eight kilometers inside the German lines. Fifteen pursuit aeroplanes were available as protection, but the mission was undertaken with but four. Attacked by fourteen enemy machines, they nevertheless continued their mission until almost cut off from the rear. An attack followed, in which one pursuit machine of their protection was brought down. Lieutenants Easterbrook and De Castro returned with the mission partially completed.

"On September 12, 1918, Lieutenants De Castro and Easterbrook were given photographic mission to perform during the attack of the American forces at the St. Mihiel salient. Because of the intense aerial activity they were unable to get pursuit machines as protection and volunteered to perform the mission unaccompanied by protection. Notwithstanding the low-hanging clouds, they penetrated four kilometers into the German lines, and at an altitude of 400 meters exposed eight plates successfully. While engaged in photography they were attacked by four enemy machines, but succeded in completing the mission after fighting off an attack.

"On September 16, 1918, while engaged in taking oblique photographs, they were forced to dive into the German lines to avoid collision with another Allied plane, which suddenly dived on them from above. Under intense anti-aircraft fire and machine-gun fire from the ground they regained their altitude of 800 meters and exposed seventeen plates on the territory behind the lines of German observation balloons, gaining pictorial information of the utmost value."

Describes His Experience

In a letter to his brother, Allen, Lieutenant de Castro describes his experiences:

"In the first place a colonel from the General Staff came to the field in person and ordered some pictures taken, eight or ten kilometers in the German lines, on a strip about 25 kilometers long, the ground to be covered twice, and forty plates to be exposed. I took it somewhat in the nature of a compliment when the job was handed to me, for it was quite a difficult task. Difficult to read the map correctly, so as to find exactly the place and—if I may say so—a job calling for alertness and a little nerve.

"I made arrangements with a chasse squadron on our field to give me a protection group of 12 Spads; to meet me at an altitude of 3,500 meters—about 14,000 feet—over our field. I attained my altitude, but after waiting around about twenty minutes, was joined by only four machines. Of course I had a perfect right to come down, but as my observer was willing I thought I could take a chance also, so we hiked out for the lines, crossing them at 4,000 meters, still climbing. I reached the near end of the strip of country we were to photograph, and told Easterbrook to go ahead. He ducked down in the cockpit and started his pictures, when, woe to me, I saw some Huns below us coming up for all they were worth—two groups of three, and one of two, and far back of us and above us four more.

Lt. Ralph E. de Castro

"So I acquainted my observer with the facts, and told him to go ahead while I kept my eyes on the Huns. They surely did think they were foxy, because the further in I went the further back they went, trying to get around me and cut me off, getting between us and our lines, so that the four overhead could jump us first, and they could keep us from getting out. Then suddenly the four above dived down shooting. I waited no longer, but nosed my machine over and hit it out for our lines at about 150 miles an hour, losing altitude all the time. I guess the Huns never saw such speed in their lives, because I walked right away from them. That's all there is to the story, except, unfortunately, that one of the Spads was brought down.

"We brought the pictures home and when they were developed and printed we discovered some beautiful new battery positions—just what the colonel was looking for.

"By the time you get this letter you all will have something more to celebrate. I can't tell you what, but Boche is going to have the stuffing kicked out of him very shortly, and believe me, if everything goes well it will be a most gorgeous job."

De Castro saw his first action during the fighting around Chateau Thierry. It was after a number of successful flights during the fighting at that place that he was first commended for promotion for his bravery and daring.

Although the application was denied at that time, De Castro wrote his friends that he would soon do something that would compel a promotion and advised them to be on the lookout.

In a newspaper dispatch dated October 3, De Castro is mentioned as one of the aviators in a squadron that dropped three tons of bombs on St. Juvin, causing serious damage. During the action the American airmen downed three Hun planes. De Castro is credited with sending one to earth in flames after shooting the wings off.

American Aviator Gets Seventh Foe

On the American Front in France.—Among the noteworthy feats of the French Aviation Service, which has displayed such wonderful activity during the Allied offensives, is that of Sergeant Major Edwin G. Parsons, who on September 29 shot down his seventh enemy machine.

After a close, long fight, the German machine crashed to earth inside the French lines.

Though he flies in a French escadrille, Parsons is considered here as an American ace.

Already holding the French War Cross, he now has been awarded the French Military Medal, one of the most coveted of French Army decorations. Parsons formerly belonged to the Lafayette escadrille, but did not transfer to the American Aviation Service.

With the American Forces Northwest of Verdun.—American aviators have been busy carrying out bombing attacks on Conflans, Longuyon, Audun, Dommary, Buxieres, Vigneulles, Chambley, Etain, Arnville and Grandpre. In one day they dropped thirty-seven and a half tons of bombs. Abileville, Gorze, Haydenville and Marcq also were bombed.

In twelve days' flying on this front thirty-four successful missions have been undertaken by the American aviators.

With the American Army on the Champagne Front.—During the American activities south of Romagne on October 9 seventy-nine Allied bombing planes passed southward, having bombed Buzancy and other railroad and supply stations behind the German lines.

American pursuit planes took an active part in clearing the air for the bombers, downing four Fokkers in the regions of Remonville and Aincreville. The bombers started out late in the afternoon in groups. After accomplishing their missions the groups met on the way back and passed over the American line in one flock.

New York Aviator Wins Unequal Fight

With the British Army in France.—A young American aviator distinguished himself in the recent great aerial activity over Belgium. He is Lieutenant Walter P. Chalaire, who at the beginning of the war was a reporter on a New York newspaper, and now is in a hospital in England with a bullet wound through his shoulder.

While attached to a British photographic group, Chalaire's machine and another went out over Ostend. On the way back he became separated from the other machine. Soon afterward Chalaire and his observer discovered a large group of German machines above them and another group below the tail of their machine. The enemy groups began a concerted attack.

Chalaire manoeuvred the machine, with the result that two enemy machines were seen to go earthward in a spin.

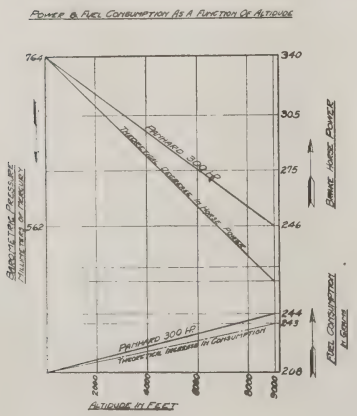
THE PANHARD—300 H.P. (DIRECT TYPE AVIATION MOTOR)

By E. H. SHERBONDY

THE Panhard Company have had in the last periods, a number of different types of aviation motor of novel construction and were amongst the very first motor firms to make use of steel cylinders, they having produced some steel cylinder motors in 1903, which practise was followed up in 1908 by the development of four sizes of aviation motors, steel cylinders, copper water-jacketed and employing a novel concentric valve construction. These motors were very well designed and built and were of very light weight.

In 1912 they produced a couple of V-type eight-cylinder motors of conventional form, employing cast-iron cylinders (*L-head arrangement*). The motor here described is designated as (V-12-J) and comprised of twelve cylinders, two rows of these set at an angle of sixty degrees from one another.

The bore is 115 mm. or 4.52 in. and the stroke is 170 mm. or 6 11/16 ins. The motor is operated either at 1,350 R.P.M. at which speed it gives 240 H.P. or at 1,700 R.P.M. at which speed it gives 340 H.P.



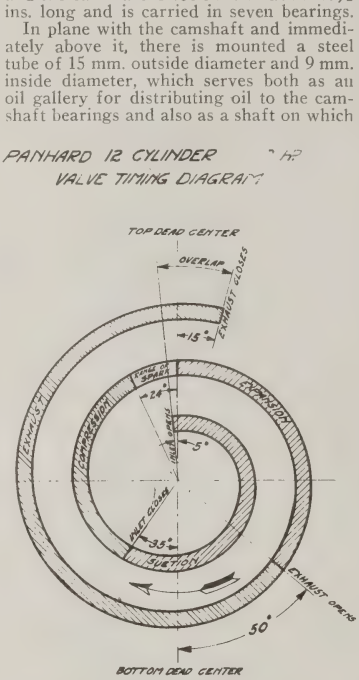
The cylinders are individual iron castings, with a single set of valves inclined at an angle of 30 degrees from one another and are operated by camshaft system, novel in form. The camshafts and excessory drives are by no means of bevelled and helical gear trains, as is now the accepted practise on aviation motors.

The camshaft is of novel form, having seven main bearings of very large diameter and disc crank cheeks. A forked-type of connecting rod is used of (I-beam section). Lubrication is fully forced and the oil pump is mounted exterior to the crankcase.

The Panhard type carburetors, equipped with the Panhard Automatic Compensator, are placed inside the (V) of the motor. Water circulation is insured by means of two centrifugal pumps, at right angles to the crankshaft and driven by means of spiral gearing. When the air starting system is provided, air being distributed to automatic valves in each cylinder, by means of a disc distributor plate, mounted on the propeller end of the camshafts.

The design of a motor in many particulars is unconventional, as will be seen by close persual of the accompanying drawings.

(Figure 1) is a section through the motor at right angles to the crankshaft.



The Camshaft

The camshaft and rocker arm train are mounted in an aluminum housing which is attached to each of the cylinders by means of four studs. The camshaft is drilled straight through 15 mm. or 19/32 in. The outside diameter of the camshaft is 25 mm. or (1 in.)

The root diameter of the cams is 35 mm. and the camshaft is 850 mm. or about 33½ ins. long and is carried in seven bearings.

In plane with the camshaft and immediately above it, there is mounted a steel tube of 15 mm. outside diameter and 9 mm. inside diameter, which serves both as an oil gallery for distributing oil to the camshaft bearings and also as a shaft on which

the rocker arms are mounted, resulting in a very neat and compact valve operating gear. The oil leakage from the camshaft train is carried to the bevel far end of the shaft, through the bottom of the case and drains back to the crank chamber, through the distribution gearing.

Cylinders and Valves

The cylinders are of cast-iron, 115 mm. bore and are completely water-jacketed. Core plates being provided on the adjacent sides of the cylinders. The valve ports are 56 mm. in diameter, 2.2 in. The valves are 62 mm. or 2.4 in.

The cylinders are retained in the crankcase by means of eight studs per cylinder.

Pistons

The pistons are cast of aluminum, 90 mm. long and carry four cast-iron rings, 6 mm. wide or .24 in. and have six internal ribs. The skirt is drilled with six 12 mm. holes, for caring for excess oil.

The wrist pin is unusually small, only 20 mm. in diameter or .78 in. and is mounted 40 mm. from the bottom of the piston. The piston head thickness is 7 mm. —.27 in. at the bottom of the cylinders, there is provided aluminum splash cups to prevent over-oiling of the cylinders.

Connecting Rods

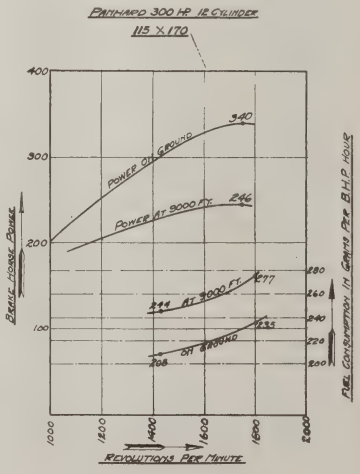
The connecting rods are 292 mm. center to center—11.4 ins. The web and flange thickness is 2½ mm.

The Crankshaft

The crankpins are 62 mm.—2 7/16 ins. diameter and the main bearings, of which there are seven—116 mm. 4.5 in. diameter and 40 mm. or 1.5 in. long and the hole through the shaft is 100 mm. straight through. The crank cheeks are circular —210 mm., 8.2 in. and are 10 mm. or .39 in. thick and are provided with annular grooves for carrying oil from the main bearings to the crankpins.

The Crankcase

The crankcase is split horizontally, the lower crankshaft bearing seats being integral with the crank chamber and a steel oil pipe is cast in this member for distributing oil to the seven main bearings and the crankpins.



A very deep pressed aluminum oil reservoir is attached to the bottom half of the base. It is provided with a horizontal screen, separating the two (2) portions of the base.

The motor is supported by means of two steel cross tubes, 52 mm. or approximately .2 in. diameter and movement of these tubes in the crankcase is prevented by means of pinch bolts in the bosses, through which they attain a slightly higher efficiency than is attained with a normal motor.

In Figure 3 is given a timing diagram of the motor. The inlet valves open five degrees. The cylinder arrangement on a base is unsymetrical, owing to the fact that the cylinders are offset 20 mm. or .78 in. This offsetting results in decreased guide pressure and permits in ten degrees overlap from the valves, after the top dead center and close 35 degrees after the bottom dead center.

When tested on the ground these motors gave 340 H.P. at 1,750 R.P.M. with a specific consumption of 208 grams per H. P. hour or .452 pounds per H.P. hour.

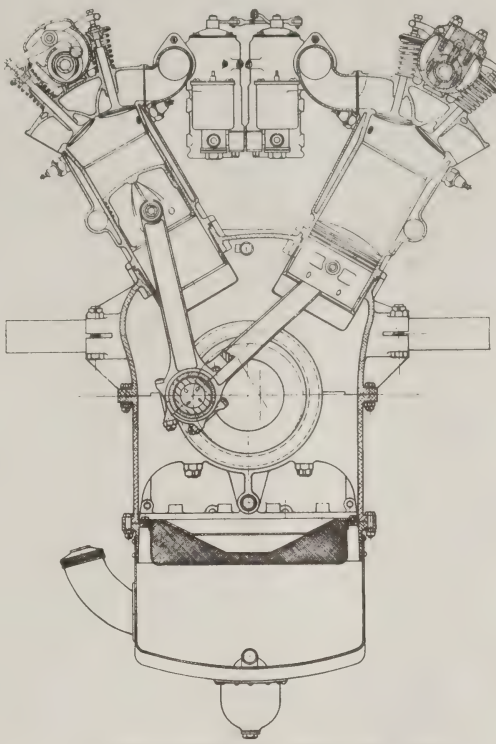
At 6,562 feet altitude with barometric

pressure of 604 mm or 23.78 ins. the motor gave 272 H.P. at 9,000 feet altitude with barometric pressure of 562 mm. The motor gave 248 H.P. with a consumption of 244 grams.

The power of the motor is absolutely proportional to the density of the air drawn in and it gave 300 H.P. at 1,420 turns on the ground.

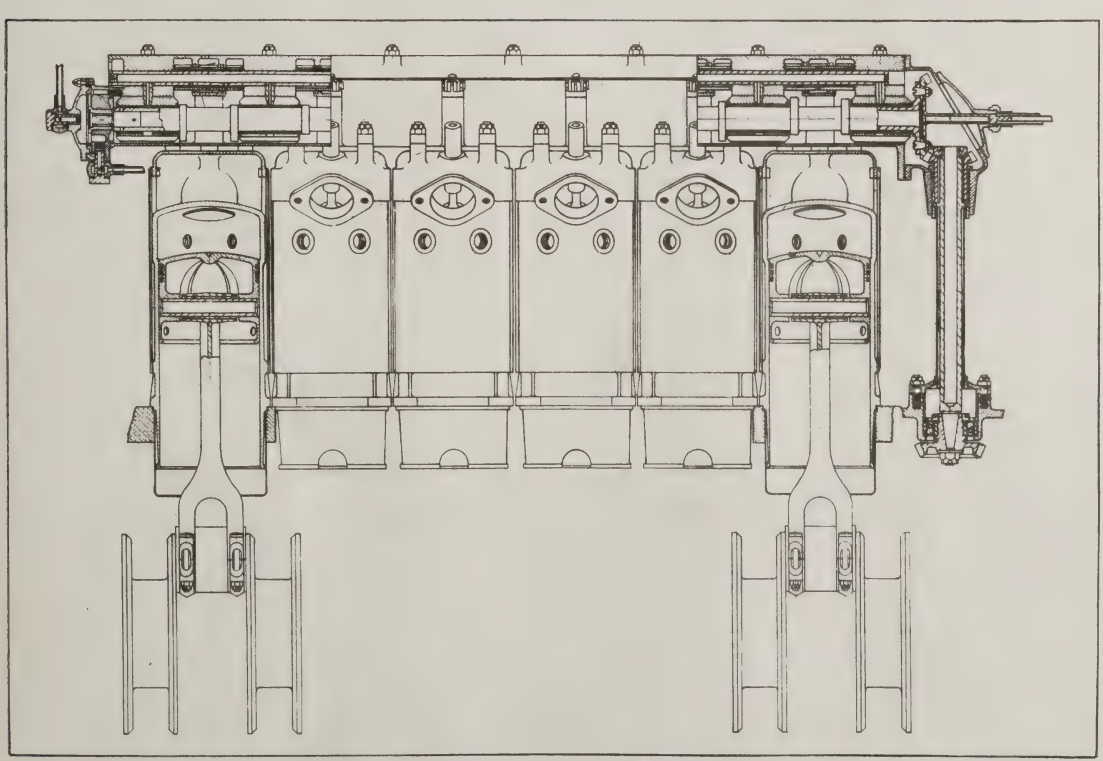
Aeroplane Apparently Stands Still While Soaring at Height of 5,000 Feet

Hovering over the city of Dayton like some huge bird with wings outspread but unable to make headway through the air, an aeroplane from McCook field was the magnet which drew thousands of pairs of eyes to it about 9 o'clock on Oct. 5. For fully 15 minutes the ship seemed not to move an inch, except in a steadily downward direction which was so slow as to be almost negligible to the vision of the naked eye. The pilot of the still craft was E. A. Johnson, a civilian flyer at McCook field.



The effect of the machine's apparent stillness was produced by Pilot Johnson equalizing the power of his motor against the wind resistance which was particularly high at 5,000 feet, where he first began his stunt. This had the effect of bringing the machine to a standstill except for the natural fall which came with the gravity of the heavier-than-air craft. Even the gravity was minimized by the outspread wings to such an extent that fully minutes was required for the drop of 3,000 feet.

The particular skill in the stunt, as pointed out by expert flyers, was that of keeping the ship on even keel while suspended. The nose, being heavier than the tail of the machine would have sent it head down and a nose-dive would have resulted had not the pilot held the machine even.



Second Provisional Wing Honors its Colonel

The officers of the Second Provisional Wing, U. S. Air Service, recently gave a dinner and dance in honor of their commanding officer, Lieutenant-Colonel S. W. Cook.

The Second Provisional Wing is made up of fully trained men and is operated identically as aviation units at the front. The entire wing is under canvas and ready to depart at any moment, with or without railroad facilities. It is composed of Corps d'Armee, bombardment and pursuit squadrons.

THE LONDON ENEMY AIRCRAFT EXHIBIT

THE ROLAND CHASER D II

By G. DOUGLAS WARDROP

VERY frequently the Allied airmen encounter the Roland biplane in combat and consequently the machine on exhibit in London is of immense interest at the present time.

The dimensions of the Roland D. II are very small:

Span of upper plane.....8.90 m.
Span of lower plane.....8.50 m.
Length overall .....6.95 m.
Height .....2.95 m.

Its weight—827 kilogs.—with full tanks is slightly greater than that of the Albatros D.III chaser. The lifting surface being 23 sq. m., the wing loading is 36 kg./sq. m. (7.2 lbs./sq. ft.).

Fuselage

The construction of the *fuselage*, and its peculiar shape, merit special attention. Being built entirely of three-ply wood and covered with fabric, it is of the monocoque type, of oval section, and terminates at the stern in a vertical knife edge. The construction is excessively light, the framework consisting of very thin longerons running through the whole length of the body, the curves of which they follow. Rigidity is only provided by the ply wood, made in two halves joined along the middle of the top and bottom. The total thickness of the six layers is only 1.5 mm. From the pilot's seat to the tail there are only four formers of very small thickness.

Between the pilot's seat and the motor the *fuselage* forms a projection tapering upwards to form at its upper extremity an edge 0.11 m. wide, to which are attached the radiator and the top plane. The top plane is cut away to accommodate the radiator. This arrangement of an upward projection of the body itself takes the place of the *cabane*. On the lower part of *fuselage*, and built integrally with it, there are the rotts to which the two halves of the lower plane are attached. At the rear the tail skid, of wood with a shoe of metal, pierces the *fuselage*, and is supported on a projection of ply wood similar to that employed on the Nieuport.

The pilot is placed very high, and has in front of him two wind screens, one on each side of the central structure carrying the upper plane. The view in a forward direction being thus divided would appear to be inferior to that obtainable in other types of machines.

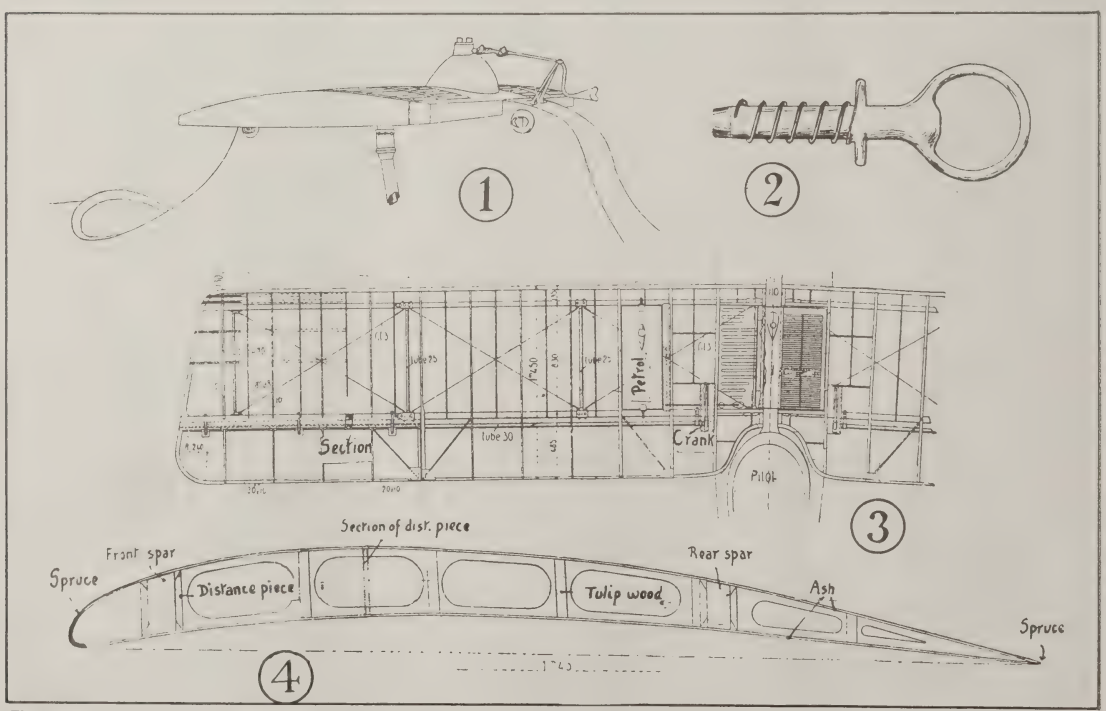
Planes

The planes are of trapezoidal plan form, of unequal span, without stagger and dihedral angle, but with a sweep-back of 1.5°. The chord, which is uniform, is 1.45 m. and the gap 1.34 m. The ribs are at right angles to the leading edge. As the inter-plane struts are secured to the spars over the same rib, it follows that in the front view the struts do not come quite in line. The spars of the upper plane, which are of spruce, are spaced 0.83 m. apart, the front spar being 0.13 m. from the leading edge. The ribs, of which there are 12, are of I section with flanges of ash. They are spaced about 0.37 m. apart. In the middle of each interval there is a false rib running from the leading edge to the rear spar. In each wing there are four compression members in the form of steel tubes 25 mm. diameter. These tubes are evenly spaced, the distance between them being 1.30 m., and are braced by 3 mm. piano wire. Between the front spar and the leading edge there are two tapes running parallel to the spars and crossing alternately over and under consecutive ribs. Two more tapes are similarly arranged between the spars. Certain corners are stiffened by reinforcement by ply wood. Each of the upper planes carries an *aileron*, which is not balanced and of equal chord throughout. A strip of three-ply wood, under the fabric, covers and protects the hinge fixed on the rear spar. The *aileron* measures 1.82 m. in length and has a chord of 0.42 m. Its leading edge is a steel tube of 30 mm. diameter. The *aileron* cranks are operated, as in the Nieuport, by two vertical tubes. In the left top plane is mounted a petrol service tank. Openings in each of the halves of the top plane accommodate the radiator. The upper planes are attached direct to the highest portion of the *fuselage* by means of special bolts resembling somewhat those used on the L. V. G. C. IV.

The lower planes are constructed in much the same manner as the top ones. The spars are similarly arranged and are consequently the same distance apart. In each wing there are 10 ribs, of which nine measure 0.01 m. and the last one 0.025 m. Between the ribs are false ribs measuring 10 mm. The internal wing bracing is the same as that of the top plane, but the distribution of the four steel tube compression struts (of which one is 20 mm. and the other 25 mm.) is somewhat different. From the first to the second is 1.17 m., from the second to the third is 1.13 m., and from the third to the fourth 1.11 m. The lower planes are attached to wind roots built integrally with the fuselage. The angle of incidence is 4° at the second rib and 3° at the seventh. The inter-plane struts are in the form of steel tubes 0.025 m. diameter, stream-lined with a wood fairing which brings their depth to 0.09 m.

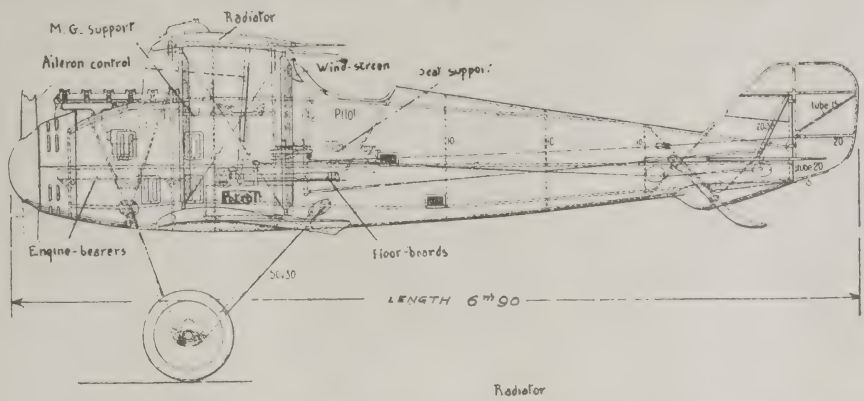
The Tail

The shape of the tail can be seen from the plane view of the machine. The fixed tail plane is built of wood, while the two elevator flaps are constructed entirely in metal.

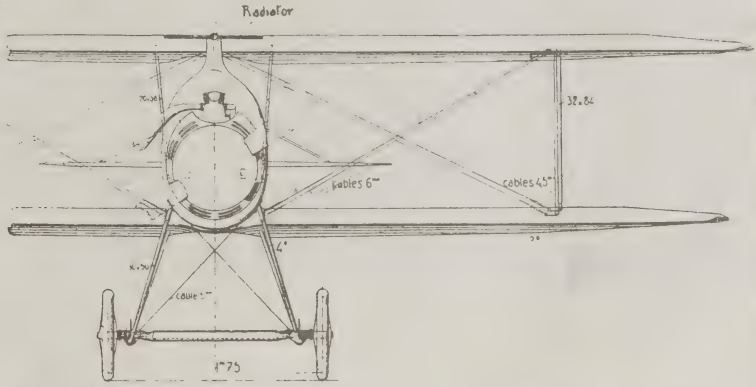


A note should be made of the attachment of the tail plane to the body. The leading edge of the tail plane is hollowed out, and into the hollow space thus formed fits a piece of wood which runs across the *fuselage* and the ends of which project 0.50 m. on each side. Further rigidity is given to the structure by two stream-line tubes running from the tail plane to the rudder hinge on the vertical fin. The rudder, which is roughly rectangular with rounded corners and has a forward projection for balancing, is built up of steel tubes, while the fin, which is made integral with the body is of three-ply wood.

The elevator cables, which are attached to a central crank lever, are enclosed inside the body except for the last meter or so from the stern.



Engine



The engine fitted on the Roland D. II is a 160 h.p. Mercedes six-cylinder vertical engine. The exhaust collector is nearly horizontal, and is placed on the starboard side. In addition to the gravity tank in the top plane there is a main gasoline tank measuring 70 x 70 x 25 under the rudder bar. The airscrew having been smashed it has not been possible to iden-

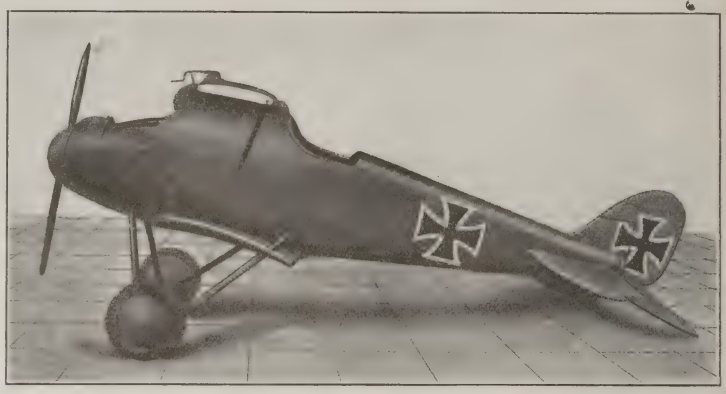
ROLAND D.II.
160 H.P. MERCEDES.

The Roland Single-seater Chaser D.II. Plan, side and front elevations to scale

tify it. It had its boss enclosed in the usual "spinner."



Armament

Two fixed Spandau guns are operated by the motor. They are mounted one on each side, and do not project through the *fuselage* covering until just at the extreme front.

Undercarriage

The undercarriage is formed by two pairs of Vee struts, braced diagonally by two crossed cables. Their attachment to the *fuselage* occurs at two sloping formers. The axle, which is placed between two cross tubes, is enclosed in a stream-line casing. The track is 1.75 m. The wheels measure 760 by 100. The shock absorbers are of rubber.

It has been said of the Roland D. II that owing to its light construction the *fuselage* is apt to get out of shape, and that it has a tendency to spin. As up to the present no test of this machine has been possible, our opinion can only be based on the testimony of our aviators. From this it appears that this machine, of new conception, must be counted among the best of German chasers. The Roland D. II single-seater enters still into the composition of certain enemy squadrons.

LIBERTY WALNUT PROPELLERS AND THE MEN WHO ARE BEHIND THEM

WHEN in the course of present events we witness the adaptation of America's plants and products to the needs of the hour, especially when a great industry springs therefrom, we have the source for inspiration. Such a feeling of inspiration will come to any one who visits to-day the industries of George W. Hartzell in Piqua, Ohio, which is in the Miami Valley, where birth was given to Aviation by the Wright Brothers, of Dayton.

Piqua is located in the Miami Valley only a few miles from Dayton, the aviation center of the world, and there for many years George W. Hartzell has been in the lumber business, the Hartzell Walnut Lumber Mills being among the most prominent in the country. George W. Hartzell has been in the lumber business for thirty years; and the last fifteen years has specialized exclusively in walnut. Every carload, trainload, wagon-load of walnut logs that you will come across en route in the Miami Valley will very likely be found on inquiry to be destined for the Hartzell Mills at Piqua.

Realizing, when America became involved in the great war, the value of walnut in the manufacture of many things that the Government would need in its war program—and because of his knowledge and experience in everything pertaining to walnut—George W. Hartzell placed his experience and facilities at the command of the country. Here experience in walnut has turned out everything from steering wheels to gun stocks—but probably the most important item being a splendid Liberty Walnut Propeller for aeroplanes.

The Hartzell Walnut Propeller Co. is probably the only factory in the country that is to-day turning out solid four-blade propellers, which are more difficult to manufacture than the two-piece. In fact the Hartzell Walnut Propeller Company is one of the early pioneers in the propeller industry and they claim to be among the few propeller companies to-day who maintain an engineering department which is actually *designing* propellers.

A recent job of which they are most proud is the special propeller just designed at Piqua for Gallaudet. The chief engineer at the Hartzell plant, whose photograph accompanies this article, is Frederick Charavay, who came to the Hartzell Company following a long experience with the Wright-Martin Aircraft Corporation. Mr. Hartzell considers Mr. Charavay one of the foremost propeller designers in the U. S.

Robert N. Hartzell, a son of the founder of the Hartzell industries, is manager of the propeller plant, and both the quantity and quality of their production testify to the efficiency of his management.

Robert N. Hartzell, Manager

Harry B. Wise, Sales Manager

Frederick Charavay, Chief Engineer

Caquot observation balloons in flight at a balloon training school in the United States. These balloons are all American made, being modeled on the invention of Captain Caquot, of the French Army. Up till a short time ago the Caquot Model M was used by the British and French Air Services exclusively. The American manufacturers have made several improvements, however, and are now turning out the Model R Caquot. One of the chief differences is that the Model R has the safety valve in the bow of the balloon, while the Model M has it in the middle of the starboard side. The angle of flight is very well illustrated in this photograph, the normal angle being but several degrees above the horizontal. The balloon on the left is probably, judging from its flight angle, in process of being hauled down. In the old style kite balloons, and in fact in the case of the present day German Drachen balloons, the angle of flight very nearly approximated forty-five degrees above the horizontal. This, it can be easily seen, imposed a much increased strain on the cable and militated against the very necessary steadiness of the balloon for observation purposes. © Committee on Public Information.

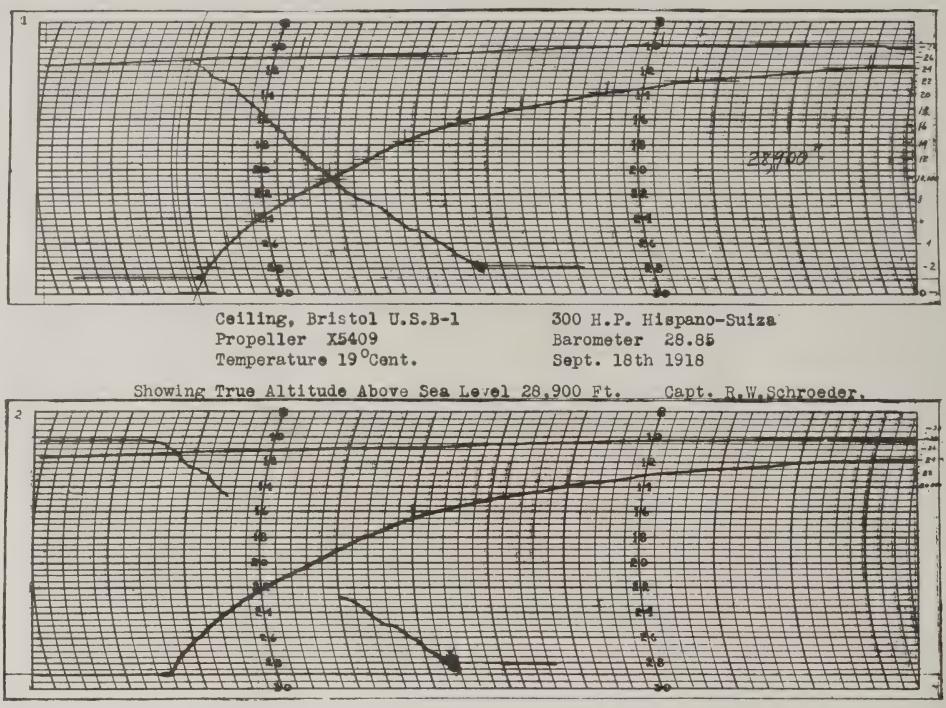
GOODYEAR PERFORMANCES

E. E. HELM

THE recent performance of the Goodyear Airship D-12 in a 360-mile flight from the Goodyear Balloon Field, near Akron, to Dayton, Ohio, and return, not alone marked the first successful long-distance airship flight made in this country, but the accomplishment was noteworthy in that it is indicative of the possibilities of this important branch of our aeronautic service which has heretofore commanded but a small share of public attention because of the predominance of an almost unlimited aeroplane program. This journey of the D-12 which was the longest any American airship ever made with a definite objective, also brought to the public attention the part that the Goodyear Tire & Rubber Company of Akron has played in the development of aeronautics.

It was back in the summer of 1910 that the officials of the Goodyear Company decided to enter the field of aeronautics which was then in its infancy. At that time the wings of aeroplanes were covered with rubberized fabric, and the company sent two of its men to Europe to investigate and report on European methods of manufacturing aeroplane and balloon fabrics. Following this, in the spring of 1911, entered in a small way into this field, and from that time on it has developed both its experimental and manufacturing facilities until to-day this company stands at the front of American balloon builders. After the elimination of rubberized fabric in the construction of aeroplanes, Goodyear steadily devoted its attention to developing lighter-than-air craft of all kinds, and now is helping the Government, both in the making of airships and in the training of men to operate them for war purposes.

Goodyear's success in balloon construction is due primarily to the foresight of its officials; but playing an important part in the development of this industry were two young men especially well equipped for the work by reason of their educational attainments as well as their courage and initiative. These men are R. A. D. Preston, now a lieutenant in the balloon service of the U. S. Navy, and Ralph H. Upson.



Around these men Goodyear built up its balloon business. They qualified as pilots early in their careers, and have studied and worked in every branch of the business, from making the fabric to piloting the balloons and airships. From this nucleus has been developed at Goodyear a corps of balloon experts second to none in the world.

It was in 1912 that Goodyear built its first spherical balloon, an 80,000 cu. ft. bag that gained world-wide fame as a winner of both the American National race and the International race. This balloon was designed and built by Ralph H. Upson, and was christened "Goodyear." In the summer of 1913, with Ralph Upson as pilot and R. A. D. Preston as aide the "Goodyear" won the American National race. This race was started from Kansas City, and there were twelve entries. In the fall of 1913, the "Goodyear," with the same crew, was entered in the great International race at Paris, being one of twenty starters. Here again victory crowned the efforts of those two intrepid young men and brought world-wide fame to them and to Goodyear. In July, 1914, just before the beginning of the war, the "Goodyear" again won the American National Race at St. Louis, with R. A. D. Preston as pilot. Thus Goodyear had two pilots eligible for the 1914 International race—Upson having already been selected to lead the American team on account of winning the previous International. The breaking out of the war, however, prevented any further competition.

The war brought new balloon problems, and Goodyear kept not only abreast, but a little bit ahead of the world's developments.

At the outbreak of the war The Goodyear Tire & Rubber Company was the only experienced manufacturer of rubberized fabric balloons in this country. The moment the Government balloon program was officially decided upon and Goodyear given a contract to build the first Navy Blimps, work was started on an immense hangar, hydrogen generating plant, and dormitories and other buildings for accommodating a large class of balloon students. Within two months after ground was broken, Goodyear was operating a balloon school and training student officers who were to be the nucleus to start the training courses at the six Naval Air Stations along the Atlantic seaboard as soon as their construction was completed. In May, 1917, the first complete airship made by Goodyear, the D-2, made a flight from Chicago to near Akron, with Ralph Upson as pilot and Herman Kraft as aide. This feat marked the practical beginning of airship construction and operation in this country.

From this time on the balloon industry at Goodyear has grown by leaps and bounds, until now huge airships flying about over the city of Akron and the surrounding country is a common sight. So too, the uniform of Uncle Sam's naval force is a familiar sight on the streets of the Rubber City, for Goodyear's balloon activities have made Akron the center of a naval colony.

Charts showing altitude curve of Captain Schroeder's world record flight

CAPT. SCHROEDER'S STORY OF ALTITUDE RECORD

By CAPT. R. W. SCHROEDER, U. S. A., A. S., Holder of World's Altitude Record

I HAVE been connected with Aviation since 1910, and during that time I have worked as a mechanician for some of America's leading pilots, and have gained a very valuable training. I was always a keen scholar and took every advantage to learn all I could, and I dare say that all my past experiences have been very beneficial to me in my efforts to establish a new World's Altitude Record. The last World's Altitude Record held by America was in August, 1911, when the late Lincoln Beachey made a climb to 11,000 and some odd feet at the big aviation meet in Chicago, Ill.

It is to be understood that, for military reasons, I am unable to give a more complete description of the improvements and changes which I made in the motor. However, I am proud to say that the motor was an American-built motor, as well as the carburetor and magnetos, and that the discoveries which were made in these experimental climbs are for the use of the United States Government.

In order to take an aeroplane to a higher altitude than any other pilot in the world, I found that it would require more than one or two attempts. I made three attempts. The first one took me to an altitude of 24,000 feet, the second to 27,000 feet and the last one to 28,900 feet; but now I feel cetrain that with a few changes and improvements, I can get to 30.000 feet or better.

Flew Five and a Half Miles High

The altitude reached is only 102 feet short of the highest mountain peak in the world, the great Himalaya peak, which is 29,002 feet high. Most people cannot stand high altitudes, and from 10,000 to 15,000 feet they bleed at the nose and ears. I had been to 12,000 feet at different times and experienced no difficulties. After being put in charge of the Testing Squadron at Wilbur Wright Field, my duties required me to go to the ceiling with all new types of high powered battle aeroplanes, which were being experimented with by the United States Government. (By ceiling, I mean the highest altitude that the aeroplane can reach. During these trips I would quite often go without the use of oxygen, and in time I discovered that I was becoming accustomed to the rare, thin air. However, I did not seem to be able to go above 23,000 feet at any time without feeling a sort of sleepy, tired, cross and hungry feeling, which I was unable to overcome except by the use of oxygen. Without the use of oxygen at these altitudes, I would feel that I was doing everything just right, and even if the aeroplane would get into some critical position and I could see when I looked down that the earth that should be underneath me was not there any more, but was way over on the other side of the machine, yet I believed that I was flying all right, and that my flying position was right, but the earth was in the wrong place. So after having these experiences, I decided that I would have to overcome these dangers, and the way I did it was to keep my mind on one thing; and that was, when the earth is in the wrong place, use oxygen. This I did, and found that it worked out very well.

Cold Great Handicap

The cold, thin air is one's great adversary. First of all, one must make a study of the performance of his motor at these high altitudes. This I did, and made the necessary changes each time before trying again. A very positive oxygen regulator and face mask should be used. These were unobtainable, for the sets I had previously tried out had failed to function above 21,000 feet. Furthermore, the face mask pressed so tight to my face that it interfered with the flow of blood and my face grew numb, so I used a rubber hose direct from the oxygen bottle, which I regulated with a valve on the bottle. The hose was placed in my mouth so that I could breathe air and oxygen at the same time. I also pressed my tongue against the end of the hose in order to tell if the oxygen was still

flowing. This method was very satisfactory, except that the oxygen bottle and the rubber tube gathered about a quarter of an inch of frost, which made it very unpleasant.

The following experiences and sensations I noticed during my flight were due to lack of oxygen. I took off at 1:45 p.m. Wednesday, September 18th, 1918, and made a steady circular climb, passing through clouds at 8,000 feet, 12,000 feet and 16,000 feet. While still climbing in large circles my goggles became frosted, making it very difficult for me to watch my instruments. The temperature at this altitude was 2 degrees below zero, Centigrade. When I reached 25,000 feet I noticed the sun growing very dim, I could hardly hear my motor run, and I felt very hungry. The trend of my thought was that it must be getting late, that evening must be coming on and that was the reason the sun was getting so dim. But I was still climbing, so thought I might as well stick to it a little longer, for I knew I could reach by ceiling pretty soon, then I would go down and, even though it were dark, I could land all right, for I had made night landings many times before; and so I went on talking to myself, and this I thought was a good sign to begin taking oxygen, and I did. I was then over 25,000 feet and the temperature was 60 degrees Centigrade below zero.

Capt. R. W. Schroeder who made the world record

As soon as I started to inhale the oxygen the sun grew bright again, my motor began to exhaust so loud that it seemed something must be wrong with it. I was no longer hungry, and the day seemed to be a most beautiful one. I felt like singing with sheer joy as I gazed about through the small portion of my goggles, which had no frost, due to a drop of oil which had splashed on them from the motor.

It was wonderful to see the very clear blue sky with the clouds thousands of feet below. The frost on my goggles bothered me very much. At times I had to remove my glove in order to put the warm palm of my hand on the glass to thaw the frost. I did this every few minutes so that I could take the proper readings of the instruments, which I marked down on my data pad. I believe that if my goggles had been better ventilated they would not have frosted. When I was about 27,000 feet, I had to remove my goggles, as I was unable to keep a steady climb. My hands by this time were numb and worried me considerably. The cold, raw air made my eyes water and I was compelled to fly with my head well down inside the cockpit. I kept at it until my oxygen gave out, and at that point I noticed my aneroid indicated very nearly 29,000 feet. The thermometer showed 62 degrees below zero, Centigrade. The lack of oxygen was affecting me and I was beginning to get cross, and I could not understand why I was only 29,000 feet after climbing for so long a time. I remember that the horizon seemed to be very much out of place, but I felt that I was flying correctly, and that I was right and the horizon was wrong.

His Motor Stops

About this time the motor quit. I was out of gasoline, the propeller stopped and everything was quiet, so down I went in a spiral. When I had descended to about 20,000 feet I began to feel much better, and realized that the lack of oxygen had affected me. I passed down through the clouds at 16,000 feet, and, as I remember, it was snowing from these clouds upon the next layer, some 4,000 feet below. I am not positive as to this, as I may have been affected by the lack of oxygen. I noticed as I descended that the air seemed to be very thick and stuffy, but very nice and warm.

During the entire trip I did not see the ground, from the time I went up through the clouds above Dayton, Ohio, until I came down through the clouds again at 4,000 feet above Canton, Ohio, over 200 miles from where I started.

I was lost, beyond a doubt, with a dead engine, over very rough country. I landed O. K. and broke the tip of my propeller, which was standing vertical, when I rolled into a depression in the ground. However, I did not nose over or do any other damage to the aeroplane or myself.

My hands and face were numb, my lips and four of my fingers were frozen, and required medical attention. Electrically heated clothing would have been very well used, but I dressed as light as possible to avoid the extra weight, as I had stripped the entire aeroplane of all unnecessary load. This was done to assist me in climbing.

Two barographs were arranged in the aeroplane, which recorded the climb on a small paper drum. I also had a thermometer out on the wing strut, which showed the temperatures. The two barograph papers and the temperatures were sent to the officials of the Aero Club of America, who called a meeting of their Board of Governors, and the result of their meeting gave me an official World's Altitude Record of 28,900 feet. The Club has sent notification of this record to the International Aeronautic Federation, and to the Pan-American Aeronautic Federation, so that the record will be recognized by all the aeronautic bodies all over the world.

Aerial League and Pacific Aero Club Elect Captain Lipsner Honorary Member

The Aerial League of America and the Pacific Aero Club have elected Captain Benjamin B. Lipsner, the Superintendent of the Aerial Mail Division, honorary member.

The communication from the Pacific Aero Club follows:

Captain Benjamin B. Lipsner, U. S. A.
Superintendent, Aerial Mail Division
Washington, D. C.
Dear Sir:

You are hereby notified that you have this day been officially made an Honorary Active Member of the Pacific Aero Club (no expense) as an expression of the high esteem in which you are held by this organization, and in consideration of the great work you have done in furthering the Aerial Mail Routes.

Very cordially yours
Pacific Aero Club.

Membership card enclosed

(Signed) Chas. F. Pond.
Rear Admiral, U. S. N., President.

Could End the War with Planes

Representative Reavis, who has recently returned from "Over There," having been under fire on the front with the American troops in the advance beyond Chateau Thierry, says the thing needed in France more than anything else is aircraft.

German machines are flying low and sprinkling American forces with murderous machine gun fire, in many cases without interference or opposition, except from rifles and revolvers in the hands of the soldiers. The Liberty motor in very limited quantities is now reaching France, but the failure to have sufficient aeroplanes in France has been disastrous in the extreme.

"Congressman Bland and I were with General Pershing when the report was brought in of the Alabama boy of F Company of a certain regiment of the Rainbow Division, who had brought down a Boche plane with his rifle. The general said, 'If that lad will just get four more, I will make him a ground ace.'

"If we can get sufficient aircraft and the transport of troops is maintained at the present rate, I have a firm hope that the war may be closed up by the fall of 1919."

THE CONTINENTAL KB-3T TRAINING TRACTOR

By John F. McMahon

Photos and Text Passed by Censor

THE Continental Aircraft Corporation's new training tractor KB-3T recently tested at Amityville, has come up to all expectations of the designer Vincent J. Buranelli. The short "over-all" length of this machine, 23 feet 4 inches, is noteworthy and characteristic of Continental machines.

Mr. Buranelli's chief object in designing the KB-3T was to produce a training machine that could be cheaply constructed. This has been accomplished by an extensive use of one-piece standardized fittings. Another point of interest is the distance between forward and rear struts, this arrangement does away with the usual bent steel brace in back of observer. A very complete list of measurements and weights are given which should prove useful in checking up with other machines.

General Specifications

Span upper plane	40′ 3″
Span lower plane	34′
Chord both planes	5′ 6″
Sap	5′ 4″
Stagger	6″
Length over all	23′ 4″
Height	9′ 3″
Net weight	1,340 lb.
Useful load	540 lb.
Gross weight	1,880 lb.
Motor, Curtiss	O X 100 h.p.
Speed range	45-75 m.p.h.
Climb in ten minutes	3,200 feet

Weights

Upper planes	118 lb.
Lower planes	102 lb.
Struts	30 lb.
Wires and turnbuckles	20 lb.
Fittings and bolts	18 lb.
Total	288 lb.
Fuselage	310 lb.
Seats upholstered	12 lb.
Stick controls and mountings	17 lb.
Dash with instruments	*13 lb.
Total	352 lb.
Ailerons	24 lb.
Elevators	16 lb.
Rudder	10 lb.
Vertical stabilizer	3 lb.
Horizontal stabilizer	19 lb.
Control cables	16 lb.
Total	88 lb.
Motor complete	390 lb.
Propeller	22 lb.
Radiator and piping	53 lb.
Gas tank and gauges	22 lb.
Exhaust pipe	16 lb.
Total	503 lb.

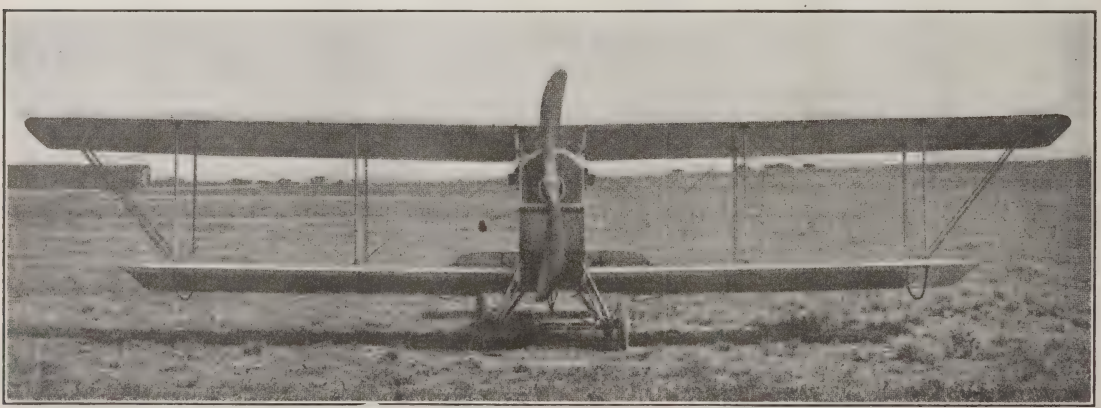
Landing chassis and incidentals = 109 lb.

Planes

The wing curve is Eifel 36. The planes are set with an angle of incidence of 2 degree-30′. Top and bottom are the same. The tips of planes are slightly rounded as is in general use on Continental machines. There is no sweepback, but a dihedral of 1 degree and a stagger of 6″. The upper planes are made in two main sections with a three-foot panel over the body. The lower plane is in two sections and attaching to the body. Wing beams are of "I" section and made of Douglass fir. The overhang is braced by a steel strut made of ⅞″ seamless tubing with a fairing of spruce.

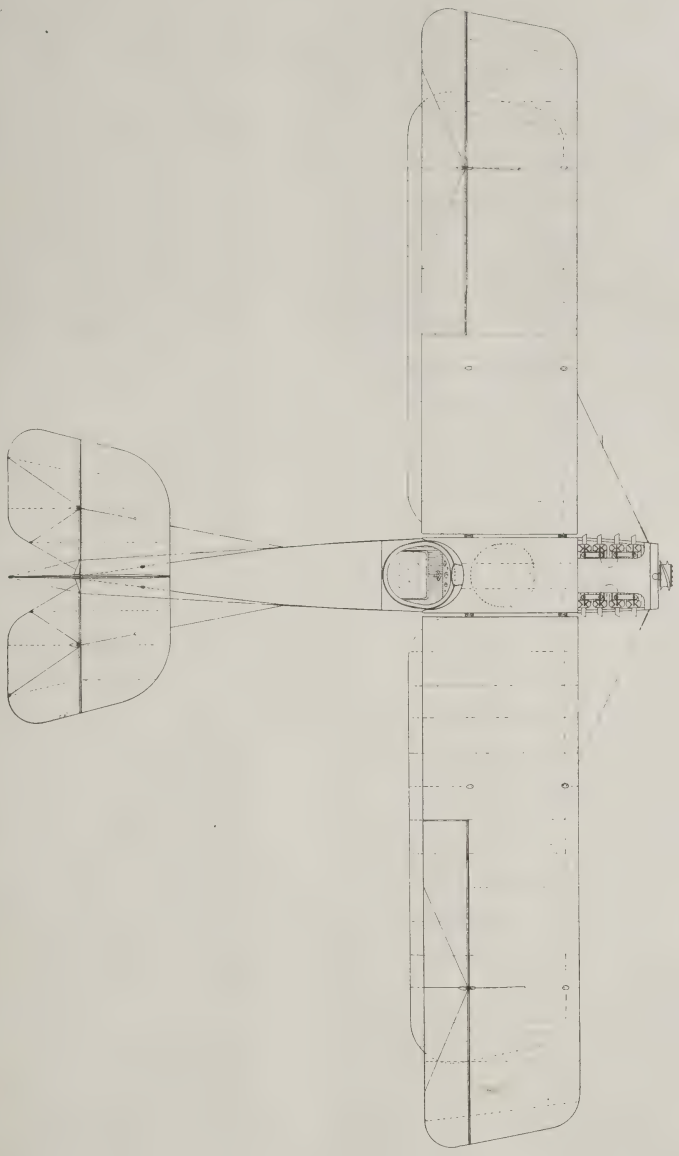
The struts are of streamline section, the maximum 3¾″ x 1½″ occuring at the centre, and tapering in proportion to each end where it sets into a special strut socket. Flying cables are double 5/32″ in inner panel, ⅛″ outer panel, landing wires are single of the same sizes. Double drift and single trueing wires are used. All control wires are internal.

Ailerons on top planes only, and are 11′ x 1′6″. Where ailerons are attached, a bevel on the aileron permits the surface to be moved without a space occuring between aileron and wing.

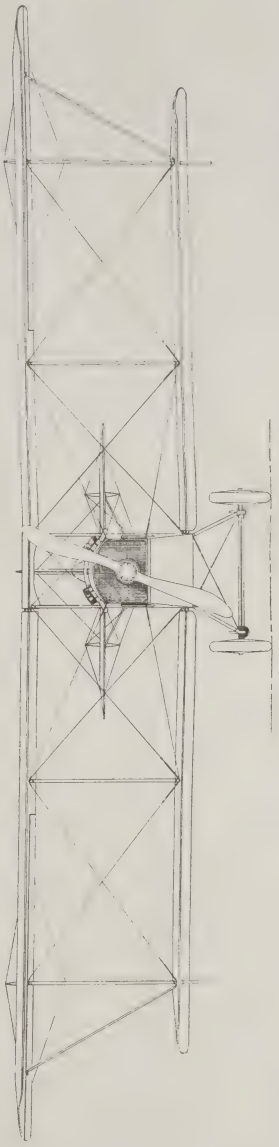


R. A. F. stitching is employed in attaching the fabric to the ribs. To finish four coats of "dope" and two coats of Valspar are used. A factor of safety of 7 is employed. The lift to drift ratio is 12.

Fuselage



Fuselage longerons are made of ash in forward part and spruce in the rear and are 1½ x 1¼″. The engine section and to a point behind the passenger seat is covered with 18 gauge aluminum. This has doors for easy inspection of the gas and oil "shut offs", etc.



Top longerons are 10″ above the line of thrust. Cowling rises to a height of 10″ above the longerons. The engine is mounted on ash beams, with a special steel nose plate in front. The two seats are nicely upholstered and feel comfortable, which should assist in overcoming fatigue. The stick control, which is dual, is very light in weight and weighs, complete, only 17 pounds. A full equipment of instruments are mounted on the dashboard in front of the pilot.

THE CONTINENTAL
MODEL KB-3T 100 H.P.
TRAINING TRACTOR

NAVAL and MILITARY AERONAUTICS

Key to Abbreviations

AAD—Assigned to active duty.
ABC—Report to Army Balloon School, Arcadia, Cal.
ADO—Report to Aviation Supply Depot, Dayton, Ohio.
ADT—Report to Aviation Supply Depot, Dallas, Texas.
AFO—Report to Aviation Supply Depot, Fairfield, O.
AGC—Report to Aviation Supply Depot, Garden City, L. I., N. Y.
AHT—Report to Aerial Gunnery School, Houston, Texas.
AIR—Transferred to the Air Service, National Army, without change in rank or date of commission.
ALF—Report to Camp Alfred Vail, Little Silver, N. J.
AMV—Report to Aviation General Supply Depot, Morrison, Va.
AOV—Report to School for Aerial Observers, Hampton, Va.
APR—Report to School of Aerial Photography, Rochester, N. Y.
ARV—Report to Aviation Supply Depot, Richmond, Va.
ASM—Report to Aviation Mechanics' Training School, St. Paul, Minn.
BFT—Report to Barron Field, Fort Worth, Texas.
BRN—Report to Bakers Field, Rochester, N. Y.
BST—Report to Brooks Field, San Antonio, Tex.
CAF—Report to Carlstrom Field, Arcadia, Fla.
CAP—Commissioned as Captain, Aviation Section, Signal Corps.
CDT—Report to Aviation Concentration Camp, Dallas, Texas.
CFT—Report to Carruthers Field, Fort Worth, Texas.
CGC—Report to Aviation Concentration Camp, Garden City, L. I., N. Y.
CGS—Report to Aviation Concentration Camp, Greenville, S. C.
CIT—Report to Radio School, Carnegie Institute of Technology, Pittsburgh, Pa.
CJS—Report to Camp Jackson, Columbia, S. C.
CJW—Report to Camp John Wise, San Antonio, Texas.
CLR—Commissioned as Colonel, Aviation Section, Signal Reserve Corps.
CMV—Report to Aviation Concentration Camp, Morrison, Va.
CPA—Commissioned as Captain Air Service, National Army.
CPR—Commissioned as Captain, Aviation Section, Signal Reserve Corps.
CRI—Report to Chanute Field, Rantoul, Ill.
CSO—Report to the Chief Signal Officer, Washington, D. C.
CUI—Report to School of Military Aeronautics, Cornell University, Ithaca, N. Y.
CWT—Report to Call Field, Wichita Falls, Texas
DAF—Report to Dorr Field, Arcadia, Fla.
DAP—Report to Director of Aircraft Production, Washington, D. C.
DIK—Report to Camp Dick, Dallas, Tex.
DIS—Honorably discharged from service.
DMA—Report to Director of Military Aeronautics, Washington, D. C.
ELA—Report to Eberts Field, Loanoke, Ark.
EOT—Report to Ellington Field, Olcott, Texas.
FLA—Commissioned as First Lieutenant Air Service, National Army.
FLR—Commissioned as First Lieutenant, Aviation Section, Signal Reserve Corps.
FLT—Commissioned as First Lieutenant, Aviation Section, Signal Corps.
FOB—Report to Fort Omaha Balloon School, Omaha, Neb.
FRF—On duty requiring regular and frequent aerial flights.
FSO—Report to Fort Sill School for Aerial Observers, Fort Sill, Okla.
GIT—Report to School of Military Aeronautics, Georgia Institute of Technology, Augusta, Ga.
GLC—Report to Gerstner Field, Lake Charles, La.
HHN—Report to Hazelhurst Field, Mineola, L. I., N. Y.
JMA—Rated as Junior Military Aviator.
JRC—Report to Jackson Field, Riverside, Cal.
KST—Report to Kelly Field, So. San Antonio, Tex. (When specified in the order, the number of the field is given in parentheses)
LDT—Report to Love Field, Dallas, Tex.
LHV—Report to Langley Field, Hampton, Va.
MAC—Report to March Field, Allesandro, Cal.
MAJ—Commissioned as Major, Aviation Section, Signal Corps.
MAT—Report to Mather Field, Sacramento, Cal.
MDO—Report to McCook Field, Dayton, Ohio.
MIT—Report to School of Military Aeronautics, Massachusetts Institute of Technology, Boston, Mass.
MJA—Commissioned as Major Air Service, National Army.
MJR—Commissioned as Major, Aviation Section, Signal Reserve Corps.
MSC—Report to Radio School, Maryland State Agricultural College, College Park, Md.
OBS—Attached to the Aeronautical Service as Observers.
OSU—Report to School of Military Aeronautics, Ohio State University, Columbus, Ohio.
PFO—Report to Post Field, Fort Sill, Okla.
PMT—Report to Park Field, Millington, Tenn.
PUP—Report to School of Military Aeronautics, Princeton University, Princeton, N. J.
PWM—Report to Payne Field, West Point, Miss.
REL—Relieved from present duty.
RSD—Report to Rockwell Field, San Diego, Cal.
RTR—Retransferred to organization attached to previous assignment to aviation duty.
RWT—Report to Rich Field, Waco, Tex.
SBI—Report to Scott Field, Belleville, Ill.
SAG—Report to Souther Field, Americus, Ga.
SGS—Report to Camp Sevier, Greenville, S. C.
SLA—Commissioned as Second Lieutenant Air Service, National Army.
SLR—Commissioned as Second Lieutenant, Aviation Section, Signal Reserve Corps.
SLT—Commissioned as Second Lieutenant, Aviation Section, Signal Corps.
SMM—Report to Selfridge Field, Mount Clemens, Mich.
SRC—Report to Columbia School for Radio Officers, New York City.
TFT—Report to Taliaferro Field, Fort Worth, Texas. (When specified in the order, the number of the field is given in parentheses)
TMA—Report to Taylor Field, Montgomery, Ala.
UCB—Report to School of Military Aeronautics, University of California, Berkeley, Cal.
UIU—Report to School of Military Aeronautics, University of Illinois, Urbana, Ill.
UTA—Report to School of Military Aeronautics, University of Texas, Austin, Tex.
VBW—Report to Vancouver Barracks, Washington.
WAC—Report to Aviation Concentration Camp, Waco, Tex.
WCS—Wire to the Chief Signal Officer upon arrival.
WDM—Wire, Director of Military Aeronautics, upon arrival.
WFO—Report to Wilbur Wright Field, Fairfield, Ohio.

Notes

Note 1—Report to places mentioned in order named for temporary duty.
Note 2—Report to Chief Technical Section, Dayton, Ohio.

THE THEORETICAL BASIS OF MODEL STRENGTH TESTS FOR AEROPLANE STRUCTURES

By W. L. COWLEY, A.R.C.Sc., D.I.C., Wh.Sc., and H. Levy, M.A., B.Sc., F.R.S.E.

Members of the Scientific Staff of National Physical Laboratory

THE importance of an accurate knowledge of stresses brought into being upon an aeroplane under various conditions of flight cannot be overestimated, in view of the manœuvres that the present war machine must be able to execute with safety. The analytical treatment of this question of stresses in aeroplane structures is unfortunately extremely complicated, both on account of our present lack of mathematical knowledge, and of the imperfectly known factors affecting the strength. If justifiable and at the same time sufficiently simplifying assumptions could be made, we might proceed with considerable rapidity to a solution, but unfortunately it is only as a result of careful experimental work that valid assumptions of this nature could be furnished.

As a simplification of the question, it is generally assumed in practice, that the problem of the strength of the various parts of an aeroplane structure is self-contained and independent of the existence of neighboring parts. An attempt for example is made to treat the wing system as an isolated structure, or the body and fuselage, the tail system or the undercarriage. But it cannot be supposed that this assumption even if it should—as it generally does not—lead to a complete mathematical solution is in any sense satisfactory, for it is clear that the mere fact that in the complete aeroplane these parts are not isolated involves an end condition, in general indeterminate, to be applied to the isolated portion. For example, the problem of the strength of a fuselage under the torsional effect of the force on the rudder might admit of an approximate solution even if the redundancies which occur were known, provided the effect of the body upon it in the region of juncture could be assumed. This itself would obviously depend upon the degree of rigidity of the framework in the neighborhood of the gap struts, and it would thus appear that the isolation of a particular part, and its treatment by rigorous mathematical methods is at most a very rough approximation to the true problem. Even in those cases where this isolation may be affected with any degree of justification, as for example, in the case of the wings, a still further simplifying assumption requires to be introduced to reduce the remaining complications. In the case referred to, it is customary to treat the effects of the normal and of the longitudinal forces on the wings separately, on the assumption that the effects can be added algebraically. Whether or not this method of treatment is legitimate can only be determined by experiment, but at any rate, it is already recognized that in the case of a staggered biplane the results are far from the truth, and intelligent designers are compelled to face the question whether the gain in aerodynamic efficiency derived from the stagger is not counterbalanced by the uncertainty of the conclusions from stress calculations. Frequently it has happened, in fact, that unknown factors for which allowance could not be made, because of our ignorance of their magnitude, have been such as to reverse completely, the conclusions as regards strength. For example, wing structures which on calculation have indicated weakness have been found on final trial to furnish a much better performance than that anticipated, on account of the effect of such unknown factors as the fabric, ribs, etc. Although in this case the errors have occurred on the safe side they are just as likely to be on the other side, and involve weakness. A continuance of the present method of blind groping is clearly wasteful and futile.

It appears, then, that the failure of analysis to treat this problem in any satisfactory manner demands the pursuit of some line of experimental investigation for confirmation of the analysis at least, if not for more direct and positive research into the question. If the basis for such experimental work could be securely laid, it would be possible to produce results both of empirical value and of the nature of the simplifying assumptions required for the mathematical treatment. To some extent the ground has already been broken on this question by tests to destruction on full scale machines. The part to be tested is loaded with sand bags according to distributions previously determined, until collapse occurs. Apart from the expense and cumbersome nature of this test it is clear that serious limitations are imposed upon its application to determine the effects of apparently unimportant parts, and various degrees of complexity of loading. No such experimental difficulties arise, however, if it should be possible to conduct the test upon a model, under which circumstances complete command can normally be obtained over the experimental conditions.

If the basis of the methods of transition from results on model tests, to full scale, could once be made secure it is evident that an immense advance could be made and tests executed with rapidity, thoroughness and relative cheapness. This point scarcely requires emphasis.

It is proposed to show that the theoretical basis of the whole method may be developed in quite a rigorous yet simple manner by an application of the principle of homogeneity of dimensions to the type of problem under discussion.

When a homegeneous prismatic strut of length l pin-jointed at the ends is subjected to axial end thrusts, then up to a load given by

$$F = \pi^2 \frac{E I}{l^2}$$

the undeflected position is one of stable equilibrium provided the ultimate stress is not exceeded. Beyond this so-called Euler's critical load, the straight position is one of unstable equilibrium. If the strut be deflected, as long as the load is maintained the axis will continually undergo change in shape until it ultimately takes up a form of elastica. During this process the yield point of the material of which the structure is composed may be exceeded and the material may rupture. The strut may thus be supposed to fail for two possible reasons, on the one hand because its shape has been permanently changed from the straight normal position owing to the instability of that position, and on the other hand because the actual material has failed to withstand the stresses originated. This conception is of course not limited to such a simple structure as a strut, for it may be seen that in general a framework of any kind may fail for either of these two reasons. In the first place, the geometrical configuration may be such that when the structure is subjected to a particular type of loading a small disturbance may involve a continuous change in shape until a finite deviation or deflection is produced. This presupposes that the geometrical shape is considered maintained as long as alterations in outline are at most of the same order as those of the disturbance, assumed small. In the second place, irrespective of any alteration in the geometrical shape of the structure, if the stresses brought into being immediately subsequent to the loading are as great as or greater than the ultimate stress the material can sustain so that the yield point is reached, the structure will collapse by direct rupture of the weakest member. Even if no external loading be applied, but the structure is under forces due only to its own weight—in a sense, of course, external loading—it can be shown that a limit exists to the dimensions of a geometrically similar structure made of the same material, so that if this limit be exceeded stresses will be called into existence so great as to involve rupture. It is proposed to investigate what information may be furnished regarding these two types of failure, rupture and instability, by an application of the dynamical laws through the medium of the dimensional theory.

Consider the case of a structure of the type of an aeroplane framework, for example, where it is supposed that the assumptions made in the ordinary beam theory apply to every part. Let the length of one part, say a bay, be given by l, the area of a particular section by A, moment of inertia I, and the elasticity and density of the material of which it is composed E and ρ, respectively. Given these quantities for this one portion, it will be assumed that the shape and geometry of the structure involve an exact specification of how to derive the corresponding quantities for the remaining portions. Let the external load be F, applied in some given manner specified by the geometry, and suppose this is sufficient to produce a stress just greater than the yield stress f in the material of the weakest member. F can only depend apart from the geometry and manner of application upon the quantities enumerated above, defining the properties of the material. These are as follows:

Physical quantity.	Symbol.	Dimensions.
Young's Modulus	E	M/LT^2
Area	A	L^2
Moment of Inertia	I	L^4
Length	l	L
Density	ρ	M/L^3
Yielding stress	f	M/LT^2
Gravity	g	L/T^2
Load	F	ML/T^2

Since F, the load which will cause collapse by rupture of the material, must involve all these quantities grouped together in such a manner as to make the dimensions of the product identical with those of F, we may write

$$F \propto E^x A^y I^z l^p \rho^q f^r g^s,$$

The dimensions of this are clearly

$$M^{x+q+r}\, L^{-x+2y+4z+p-3q-r+s}\, T^{-2x-2r-2s} = \frac{M\,L}{T^2}$$

Equating powers of M, L, and T,

$$x + q + r = 1,$$

$$-x + 2y + 4z + p - 3q - r + s = 1,$$

$$-2x - 2r - 2s = -2,$$

$$\therefore F \propto E^{1-q-r} A^{1-2q-2r-4s} I^{r+s} l^{-1+3q+r-s} \rho^q f^r g^s$$

$$F \propto \frac{E\,I}{l^2}\left(\frac{f}{E}\right)^{r}\left(\frac{A}{l^2}\right)^{y}\left(\frac{W}{f\,A}\right)^{s}\left(\frac{I}{l^4}\right)^{z} l^{-1},$$

It will be more convenient to write this in the form

where instead of $g\,l^3\,\rho$ its equivalent W, the weight of the portion of the structure considered, is taken.

It is evident that every term in the expression for F must take the form given above, but so far no restriction has been imposed on the values of the quantities r, s, y and z. Under these conditions F could be represented as the sum of a series of terms in which f/E, A/l^2, $W/f\,A$, I/l^4 could appear to any power whatsoever, but in each such term EI/l^2 would be a factor. This is equivalent to the statement that

$$F = \frac{E\,I}{l^2}\,\psi\left(\frac{f}{E}, \frac{A}{l^2}, \frac{W}{f\,A}, \frac{I}{l^4}\right)$$

where ψ for the moment is an arbitrary function. Writing

$$\phi^2 = F\,l^2 / E\,I \qquad (1)$$

so that this quantity may be considered as a non-dimensional critical loading coefficient, it follows finally that

$$\phi^2 = \psi\left(\frac{f}{E}, \frac{A}{l^2}, \frac{W}{f\,A}, \frac{I}{l^4}\right) \qquad (2)$$

It is clear from the definition of ϕ, that for a given structure where l, E, and I are known ϕ is uniquely determinedwhen F, the breaking load is found, so that the discussion of collapse by rupture may equally well be centred round ϕ. Let it be clearly understood that the exact form of the function ψ in (2) depends only on the geometry of the structure, including the manner of loading and the law of distribution of material.

Similarity of Structures.—Out of the general class of framework embraced in this discussion so far let there be selected a series of which all members are identical with respect to external shape, differing only in magnitude. This implies that A the area of cross section of any selected part is proportional to l^2 and I to l^4. For this series, therefore, A/l^2 and I/l^4 are constants depending only on the geometry, and accordingly expression (2) now takes the simplified form

$$\phi^2 = \psi_1\left(\frac{f}{E}, \frac{W}{f\,A}\right) \qquad (3)$$

It is not difficult to give an interpretation to the two non-dimensional qualities f / E and W / f A. The former being the ratio of the yielding stress to Young's modulus may be taken as the strain at the yield point, on the assumption that Hooke's Law applies rigorously over the whole range. In the same way, W / f A is the ratio of the weight of a particular member, say the weakest, to the maximum tensile or compressive force, as the case may be, which that member is capable of withstanding without yielding assuming that the section A is taken at the position of collapse.

As far as a discussion of the breaking load co-efficient ϕ^2 is concerned, it is evident that if a series of geometrically similar structures be selected two distinct variables, and two only, functions of the material affect the question. These are the strain at the yield point for the weakest member, the ratio of the weight of that member to the maximum tensile or compressive force it can withstand at the point of yield. It is equally clear, however, that the so-called geometrical restrictions determining the distribution of the constants of the materials in a composite structure are not absolutely vital to the above discussion, so that violations of the laws determining the selection of the material from member to member would not necessarily vitiate the conclusions arrived at here. For example, one would not be rigorously entitled to vary I, A and E in certain members, since such a change would clearly upset the geometrical similarity of shape and the distribution of force with the possible result that the previously weakest member might now not remain such. No such trouble, however, could arise if the selection of the materials was made without changing these factors, but allowing a variation in f the yielding stress so long as the previously weakest member always remains so in the series. This is equivalent to an increased latitude in the scope of selection of material.

Generally in experimenting with a model of this nature it is convenient, of course, to have corresponding parts in the model and the full-scale structure composed of identical materials. If for example, the frame of an aeroplane were under discussion, wires in the model would be composed of the same metal as those in the original, corresponding struts, spars, ribs, &c., of the same wood.

Since the quantities f, E l, ρ, &c., in the expression for ϕ^2 all refer ultimately to the same part of the model, to ensure geometrical similarity in the widest sense it follows that the assumption that f / E is a constant is one which is obvious experimentally. Under these circumstances also W / f A, as can easily be verified becomes proportional to the linear dimension l. The breaking load co-efficient ϕ^2, therefore, when the weight of the structure contributes towards rupture is purely a function of l,

$$\phi^2 = \phi_1 (l),$$

and the form of the function is determined only by the shape of the various parts, the geometry of the loading and the so-called geometry of the material.

This expression for ϕ^2 may likewise be supposed solved for l in terms of ϕ. For every external load coefficient this equation then determines the size of the structure corresponding to failure. When there is no external load and failure is due to weight alone $\phi = 0$ and the result previously anticipated is seen to hold.

Structures of Negligible Weight.—When the material is not sufficiently heavy to involve the weight of the structure appreciably as a factor in causing collapse the term W / f A may be omitted in equation (3) and the expression for ϕ^2 takes the relatively simple form

$$\phi^2 = \phi_2 \left(\frac{E}{f} \right).$$

Let us imagine that the weakest member is replaced by another of the same geometrical shape and size but with a different value of f / E, though not so different as to prevent its remaining the weakest member, then a test on each one of these models will give a particular value of ϕ^2, breaking load coefficient, and these when plotted against f / E will give a "characteristic curve" for the structure of the given geometry. For geometrically similar structures of which the corresponding parts are made of the same material, so that f / E is constant, the critical load coefficient becomes an absolute constant for the series depending for its value purely on the shape. It follows that a simple test to destruction on a model will suffice under these conditions to determine the breaking load coefficient ϕ^2, and therefore the breaking load F for any other member of the series.

Failure Due to Instability.—It is assumed in this section that the failure is not necessarily accompanied by collapse or rupture in the material but is due merely to permanent deformation of the configuration of the structure. It follows that in the expression for the critical load, the yield stress does not enter although all the other terms A, l, E, I, ρ, g may do so. Using ϕ^2 as a critical load coefficient defined by F l^2/E I ϕ^2 then

$$\phi^2 = \psi_1 \left(\frac{A}{l^2}, \frac{W}{E A}, \frac{I}{l^4} \right) \quad . \quad . \quad . \quad . \quad (4)$$

obtained by the same method as in the previous section.

On the understanding that the structures in the series are all geometrically similar as regards external shape without reference to material composing them, then A/l^2 and I/l^4 are constants for the series and

$$\phi^2 = \psi_2 \left(\frac{W}{E A} \right) \quad . \quad . \quad . \quad . \quad . \quad (5)$$

where W/E A is the ratio of the weight of a member to the tensile or compressive force required to produce unit strain at some particular section of that member.

If corresponding members of the series are made of the same material then W/E A is easily seen to be proportional to l, from structure to structure and as before the critical loading coefficient,

$$\phi^2 = \psi_3 f \quad . \quad . \quad . \quad . \quad . \quad (6)$$

depends on the size only.

When the weight of the structure is negligible as far as its effect in contributing to failure is concerned, the whole instability arising from the external loading, then ϕ^2 is constant for a series of structures of identical form irrespective of the material of which it is composed, and a test to destruction on one model suffices for the series.

It has been found that the critical loading for a uniform prismatic strut of negligible weight under end thrusts and pin-jointed at the ends is given by $F = \pi^2 \frac{E I}{l^2}$, where l = length of strut, I the least moment of inertia, and E = Young's modulus, so that ϕ for this structure is π. For a strut under the same conditions but with fixed ends $\phi = 2\pi$.

In certain cases of simple shapes of structures, it is obvious that the function ϕ^2 may be derived by calculation as for example in the case of the prismatic beam supported either on "pin-joints" or clamped supports, but for more complicated problems where the calculation is too abstruse a number of points on the characteristic curve may be derived by a series of tests to destruction on models.

In the special cases where ϕ is a constant for the series a single test on one model is clearly sufficient. This, as has been shown, applies with equal force when the collapse is due either to instability or failure of the material.

The basis of the experimental method thus having been made secure, no scale effect difficulty of the type normally arising in aerodynamic work being present, it should now be possible to proceed to a direct accurate test of failure and its causes under various circumstances. As usual there are of course both advantages and disadvantages to be faced. A model of an aeroplane or a special part sufficiently accurate for the present purpose may be constructed at comparatively little cost. All the numerous details of contour and finish that are normally necessary in the production of such a model for ordinary aerodynamic purposes now find no place here. The question as to whether exceptional care or otherwise would require to be exercised with any special portion, as for example the junctions between the fuselage and the remainder of the machine, the junction of the wires and of the spars and ribs, etc., could of course easily be settled experimentally by testing for consistency of results.

A much more serious question, however, is that involved in the possible invalidity of the foregoing analysis should Hooke's Law fail to be obeyed—a real difficulty in the case of wood of which most of the members are composed—but exactly the same trouble would arise in a mathematical investigation of the stresses brought into play. In all such cases Hooke's Law is assumed to hold.

Two further points merely require to be mentioned. There is no mathematical machinery at our disposal for determining accurately the dynamic effect of a variable load such as occurs for example when an aeroplane is executing rapid manœuvres of particular types, or when the controls are brought sharply into operation. Essentially this is of the nature of an impulsive loading and the ordinary convention that it suffices to consider it as a live load and thus to double the safety factor cannot be regarded as quite satisfactory. Physically the problems are quite distinct. Secondly, the question of the effect of vibration of and upon the structure has received scant attention. Model experimental work of the type indicated, clearly furnishes an extremely convenient method for approaching these problems.

(*Continued from page* 289)

a full-sized aircraft programme, large enough to set the manufacturers going at full speed, with orders far enough ahead to permit them to establish efficient quantity production and keep labor happily engaged in producing, with an idea of a permanent position. Labor in the aircraft industry has been constantly upset by the fact that factories only had limited orders, with no further orders to look ahead to. Under such conditions, labor could hardly be blamed for looking for other positions. Speeding up under such conditions was very much like rushing oneself out of a job.

Secretary Ryan is Back

Secretary Ryan is back. He returned a few days ago.

"Upon reaching France," Mr. Ryan said, on October 15, "I went immediately to the front and was with our forces during the St. Mihiel fight and the battle of the Argonne.

"The air forces in both offensives were under the direction of the American commander, and, while the French furnished a large part of the forces used and the British co-operated, the American squadrons made up about half of the number participating. The commendation of the work of our pilots was tempered only by a suggestion that perhaps our boys were too venturesome and overcourageous.

"The United States De Haviland 'planes were in general use for observation and day bombing in both the St. Mihiel and the Argonne attacks, and the pilots were to a man enthusiastic as to their performances. While individual pilots and commanders had suggestions as to improvements and betterments that might be made, they were individual and seldom indicated anything more than a personal preference for some rearrangement of details.

"The commanders of all the squadrons using De Haviland 'planes, as well as 'planes of British and French manufacture for like purposes, told me that the pilots in every case would prefer to take a De Haviland machine with a Liberty engine over the line rather than any machine of a like type. This is due to the fact that the machine is fast, and for one of its type is quite manœuvrable; that it climbs well, and the pilots all agreed is a very efficient machine for the uses for which it is intended.

"On my trip the Liberty engine was the cause of more worry to me than anything else, because all of the Allied nations were demanding more of them than could possibly be supplied. French, British and Italian have used the Liberty engine in their own machines at the front, and their building programmes as now laid out are based to a considerable extent upon obtaining a supply of these motors in this country.

"I come home feeling that our allies consider the success of the United States in producing this engine in large numbers one of the greatest accomplishments in the war. Both the British and the French are now putting the Liberty motor in 'planes that formerly carried engines of either a heavier weight or less power. I can safely say that the Liberty engine, with its high power combined with lightness, has greatly increased the efficiency of some of the 'planes that the Allies have been using at the front for some time.

"Their representatives even expressed themselves to me that it has made new machines of several types."

The Aerial Mail Is Using Surplus Facilities

By Charles N. Kight, Special Representative of the Post Office

The following is a copy of a letter Mr. Otto Praeger, Second Assistant Postmaster General, is mailing to the Presidents of all the leading business organizations and clubs in this city, embracing in part information not previously incorporated in matter distributed in the interests of the aerial mail service:

"Dear Sir:—I desire to bring to your attention the facilities of the aerial mail service which is equal, if not superior to the telegraph in the transmission of important communications to Philadelphia and exceeds the fastest train service by two and a half hours to Washington. Letters mailed in New York in time to catch the noon aerial mail, invariably reach the professional and business element in Washington before the close of the day's business.

"This service is rendered for only three cents per ounce more than the usual special delivery letter forwarded by rail. Six cents is charged for each additional ounce.

"The Postmaster at New York will furnish any information desired, or Mr. Charles N. Kight, special representative of the Aerial Mail Service, with headquarters in Washington, will be glad to go into the subject of the aerial mail service, its accomplishments and prospects, should his presence at any time be required, to shed light on this new and interesting governmental agency.

"Sincerely yours,
(Signed) "Otto Praeger,
"Second Assistant Postmaster General."
"100 per cent. perfect service daily."

Among the very few criticisms I have met in efforts to familiarize the business element and the public generally with the superior facilities offered by using the aerial mail service, I note the following: One party said: "Why attempt to inaugurate a service by aeroplanes when both aeroplanes and pilots are needed on the battle front in France?" The answer is this: "The aeroplanes now used in this service with a carrying capacity of about 500 lbs., and a limit of speed of about 100 miles per hour have been rejected as unfit for service abroad; planes with the Liberty Motor and a carrying capacity of 1,000 lbs. and a speed limit of about 150 miles per hour, being recognized as far superior for use in France." After the war these superior planes will be at the disposal of the Aerial Mail Service, enabling the time between terminals to be shortened nearly fifty per cent., insuring the delivery of mail from New York to Chicago, for instance, being delivered in about six hours.

The pilots employed in the present service are men who have failed to pass the extremely rigid examination required to make them eligible for foreign service, or possess certain disqualifying conditions, all, however, being eminently qualified as pilots handling the planes employed in the United States Aerial Mail Service. As an evidence of the rigid tests applied to applicants desiring to enter service overseas, the following facts stand out prominently, reflecting somewhat on the government's requirements: A number of men who offered their services, and failing to pass the rigid examination, applied for service to the Canadian government, were accepted and sent abroad. To-day several of them have made a world-wide reputation, ranking high among the Aces.

The service now effective between Washington and New York is daily growing in popularity now that it is understood that the service insures immediate delivery and, in some instances, hours in advance of time by rail mail, necessitates the use of only three cents per ounce more than required if forwarded by special delivery train service.

It is also true that the present congestion of mails, as well as delays by telegraph, owing to the shortage of help and the epidemic of influenza, has directed special attention to the aerial mail service, which makes 100 per cent. daily records, regardless of winds, storms or any other serious climatic conditions. Mail matter forwarded by the aerial mail service is in rapid motion from the time it is delivered to the planes until it reaches the party addressed.

MILITARY AEROSTATICS

By LIEUT. H. K. BLACK, R. F. C., C. F. A.

SOME sections have had great success with a permanent screen of withes and thatches. These were built up around the bed and about ten to fifteen feet outside the ridge wire. It withstood the wind very well, I understand, but it had the disadvantage that it was not movable and also it tended to cramp the action of the crew in working around the balloon. Sometimes this is a very great disadvantage. Personally, we had fairly good success with a canvas screen which we erected and carried with us. Poles were put in the ground to which pulleys were attached and through these, ropes attached to the heavy tarpaulins were rove. In this way we were able to raise and lower the screen at will. In the terrific winds we were subjected to in France, sometimes the tarpaulins would tear to pieces and blow to ribbons before they could be resecured. I have seen the poles, on which the screens were erected, snapped off like matches. On one occasion we secured half a dozen steel rails from a railway track and when we got them up—I say when we got them up, for it was quite some job in the wind—they were there to stay.

The main function of a screen is not so much to keep the wind from hitting the balloon as to shoot the wind upward to the curved upper surface, where it will even help to press the balloon to its bed.

Balloon Baskets

BALLOON baskets are a thing which have undergone many changes since war broke out. There was the day of the old spherical observation balloon the basket of which was a small uncomfortable affair, which sometimes, if one is to believe all the stories one hears, was not altogether too strong. It is easily imagined that those baskets would not stand up to service very long as they received rather rough handling from the wind. Landings those days were not the comfortable thing they are today. They were as often as not quite involuntary. I have seen spherical balloon baskets, however, which were fitted up comfortably, if not luxuriantly. One in particular I remember was a regular Pullman car for comfort. It was about the size of the ordinary Pullman smoking room and had a leather upholstered couch across one side very much the same as the smoking room.

With the advent of the kite balloon, however the baskets underwent a change. They were made quite a bit roomier and considerably stiffer. Nothing is quite so uncomfortable, particularly the first or second ascent, as to have a basket with a springy floor. The floor may be quite safe, but it is impossible to make the novice believe it when it is springing under his every step. Quite recently in fact, we had some balloon baskets issued to us in France. They were designed for one observer but for some reason they had been issued with a single basket balloon. That meant that two men must ascend in a basket meant for one. None of these single baskets were re-inforced with steel cables in the bottom and under the strain of two observers they did not last very long. They were not popular with any of our observers and when the writer, stepping heavily on the middle of the floor one day, felt his foot go through into the top layer of four thousand feet of atmosphere, he added his mite of condemnation. Shortly after, these baskets were condemned and double baskets issued.

The baskets at present in use in the Caquot type of observation balloon are almost square. They are about four by four and a half feet in dimensions and are designed for two observers. They can carry more. In fact in training I have seen five men in one of them but for real work on the front two men are about all they can carry efficiently. They are made of woven willow wickerwork as shown in the illustration, re-inforced by small steel cables woven in with the willow. On the bottom they have landing skids, partly to allow the basket to slide along the ground in landing and partly to add to the strength of the basket.

The interior of the basket is fitted up with the dual idea of having comfort and efficiency. To a great extent the latter is dependent, or at least augmented, by the former. The basket is lined with a rubberized fabric which is windproof. The floor is covered with a thick carpet and in winter generally with a goodly layer of straw also. In an aeroplane at great heights there is no doubt that it is much colder than in a balloon at a comparatively low altitude, but in the winter it is bitterly cold standing in a balloon basket for several hours at a time even clad in heavy flying togs. Running round the inside of the basket is a thick piece of upholstery to reduce the damage to one's hipbones in a rough landing. Pockets for the reception of maps, pencils, spare instruments, binoculars, lunches and sometimes, I fear, a stray magazine or book, for use when things get slow, or when one is "sitting up" waiting for a shooting view, are placed around the interior of the basket.

To be continued.

Fitting the basket of a Caquot observation balloon at a training camp "somewhere in the United States". The basket has been "toggled on" to the balloon rigging and then the instruments are adjusted. The telephone is tied into the basket, the aneroid barometer is adjusted to zero, the Pitot tube or anamometer put in place, binoculars and maps placed in the basket and the telephone fastened on and tested. One of the training type of parachute can be seen hanging on the outside of the basket

FOREIGN NEWS

BELGIUM

An official statement from Belgian headquarters on October 7 says:

Our aviators bombed enemy camps at Westende and Middelkerke.

During the day the enemy bombarded Nieuport and the zones about Clercken and Westroosebeke, as well as our communications in the rear areas.

German aviators are very active machine gunning our first lines and our roads near Moorslede and Passchendaele.

Ten enemy aeroplanes were brought down and three balloons burned.

GREAT BRITAIN

"Twenty-two hostile machines were destroyed and three were driven down out of control. Twenty-four of our machines are missing. Twenty-two tons of bombs were dropped on Sept. 28.

"Night bombing continued with greater intensity, in spite of the unfavorable weather. Thirty-four tons of bombs were dropped, and many machines continued attacks until dawn. All the night-fliers returned."

"The air force with the navy, coöperating in the Belgian offensive on September 28, dropped thirteen tons of bombs and set fire to two trains and several ammunition dumps," says an Admiralty statement. "Massed motor transports and a hostile battery were attacked and casualties inflicted. The airmen engaged also in spotting for the monitors shelling the German coast defences.

"The latter part of the day large formations of hostile aircraft working inside the enemy lines were encountered. Four planes were destroyed and four were brought down out of control. Thirteen of our machines are missing; a majority of them failed to return from the enemy lines after a sudden and violent rainstorm."

British bombing aeroplanes during the day of September 28 contributed very greatly to the success of the operations. They bombed without cessation enemy troop columns, transports and communication lines, says a Belgian Report.

In an official report on September 30 Field Marshal Haig says:

"On Sunday fifteen hostile balloons were destroyed. Twenty-six planes were brought down, and nine others driven down out of control. Nineteen of ours are missing. Thirty-six tons of bombs were dropped on railway stations and junctions.

"The air force, in coöperation with the navy, bombed enemy destroyers and raided Zeebrugge, Ostend, and Bruges, and aerodromes in the vicinity of Ghent. Twelve hostile machines were destroyed, and fifteen driven down out of control. Ten of ours are missing."

The following shows the six points from the coast of Flanders to the fringes of the Syrian desert where the Royal Air Force have operated recently:

Destructive air raids on German submarine, naval, and aircraft stations in Belgium.

Air fighting between La Bassee, Peronne, and the St. Quentin road.

Sixteen heavy bombing raids by the Royal Air Force independent section in Germany.

Low-height bombing and machine-gun fighting from the air on the roads to Strumnitza.

A double raid on Constantinople, causing damage to the station and military buildings at Nagara and Stamboul.

Great aerial activity on the Palestine front, resulting in much destruction of enemy transports, stores of war material, and heavy casualties to the retreating enemy.

For some time past contingents of the Royal Air Force and the Australian Flying Corps have been carrying out a reconnoissance over the maritime plain stretching from Mount Carmel on the north to the Shechen-Joppa road, as well as over Samaria and the Valley of the Jordan. Acting in coöperation with the infantry and cavalry units, British airmen on the night of September 18 bombed the enemy railway junction of El-Afuleh in the plain of Esdraelon, south of Nazareth, hindering the despatch of reinforcements from the south. Through the following day they continuously bombed the enemy's headquarters and harassed the retreat by firing thousands of rounds against troops and transports, and dropping more than eleven tons of bombs on various objectives behind the enemy's lines.

On the Salonica front, on the morning of September 21, British aeroplanes brought timely advice of the impending retirement of the enemy. Later in the day they saw that the Kosturine-Sturza road was densely packed with troops and transports hurrying to the rear. Squadrons of British airmen continuously attacked these from a low height, causing much material destruction and many casualties.

In the course of a single air fight between four British machines and fourteen enemy craft two of the hostile machines were destroyed, while one British aeroplane failed to return.

On the western front in France, in addition to dropping nearly 140 tons of bombs, destroyed ninety-one enemy machines, drove down thirty-five out of control, and shot down eight kite balloons in flames. Forty British machines were reported missing. On the Rhine front nearly fifty tons of bombs were dropped during the week on railways, blast furnaces, factories, and hostile aerodromes. In Italy six enemy machines were destroyed and three were driven down out of control. All the British aeroplanes returned safely.

The British Air Ministry issues the story of a neutral resident who has just returned from Germany with information on the effects of recent British air raids over the Rhine provinces, particularly in Frankfort.

The central part of the Frankfort main station was so extensively damaged by bombs that trains have not been able to enter and are being operated from hastily constructed platforms some distance from the station. The people of Frankfort, according to this neutral, are in a state of nervous excitement. At the least unusual noise the people retire to their cellars, not daring to sleep in their apartments.

As to the moral effect of the raids, the neutral says he heard nothing but the most depressing talk of the present conditions in Germany and the prospects of further attacks from the air.

The Treves Railway was bombed by the British independent air force Tuesday, according to an official statement issued October 2.

British aerial squadrons bombarded Lichtervelde, causing a fire at the railway station. They also broke up several enemy convoys.

The Cologne *Gazette* frankly acknowledges that "these raids are having the effect on morale which the Entente Allies intended."

It speaks of how the pessimism of the bombed districts is spreading to other parts of the empire through letters written from the Rhine towns.

And the air offensive is not only directly but indirectly having its effect on the military operations—through the German efforts to increase their air power and the consequent drain on other branches.

British air power is constantly increasing and the Air Ministry is taking every possible step to see that the fliers' and workers' efforts for the country do not "set them back" when they return to civil life. Almost every mechanical trade is taught in the training schools, and exceptional educational advantages are offered.

The British losses are comparatively light, the air chiefs state. They announce that one machine is lost or damaged for every five tons of bombs dropped, or one machine for every six raids.

The British airmen during the last three months have wrought heavy damage to military objectives in Western Germany and forced the withdrawal of several enemy air squadrons from the battlefront in a vain effort to protect the raided territory, the British Bureau of Information announced here on October 4.

A 250-mile belt of the Rhine Valley, in which are located the principal German war industries and railway systems vital to maintenance of the Teutonic lines in France, has been brought definitely into the war zone, the statement said. British fliers have raided enemy territory 249 times and dropped 247 tons of bombs on strategic points. Aside from destroying or damaging munition and poison gas factories, railway stations and trains, the attacks have had a widespread moral effect, demonstrated at dozens of public meetings in the Rhine towns demanding cessation of aerial warfare.

FRANCE

Concerning aerial activities of September 27 the official statement from the French War Office says:

"Our bombing aeroplanes made expeditions during the day and night incessantly harassing enemy transports and troops and attacking convoys. Twenty-five tons of bombs were dropped behind the battlefront, especially on the railroad from Somme-Py to Challerange and on the important centres of the Medeah Farm and Ardeuil and on the crossings of the River Alin. At night the railroad stations at Longuyon and Audun-le-Roman and the aviation field at Stenay were bombarded heavily.

"French aeroplanes destroyed nine German machines and set on fire one captive balloon. It is confirmed that Lieutenant Fonck alone destroyed six enemy machines on September 26."

Lieutenant Fonck's total now aggregates sixty-six.

Fonck's latest feat duplicates his own record and also those of Captain Trolloppe and Lieutenant Claxton, both of the British Flying Corps.

The statement of Sept. 30 says:

"On September 30 our aviators destroyed and put out of the fight twenty-five German aeroplanes and set fire to two captive balloons.

"Twenty-six tons of bombs were dropped on convoys and concentration points behind the enemy lines, especially on Challerange, Liry, and Mont St. Martin. Thousands of rounds were fired at the enemy troops by French airmen."

FRENCH

The French official on aviation, issued October 3, says:

Our bombarding squadrons surprised gatherings of the enemy which were being formed in the region of Contreuves and Mont St. Martin. They attacked them with bombs and machine guns. Twenty-six tons of bombs and thousands of cartridges were used with good results.

Ten enemy aeroplanes were destroyed or put out of action. A balloon was set on fire.

The report for October 5 says: "Nineteen enemy machines were destroyed by our aviators and three balloons set on fire. Bombing aviators dropped during the day 1,700 kilograms of projectiles. Several thousand rounds were fired at enemy troops and more than five tons of bombs were dropped on them.

"Thursday night bombing aviators dropped twenty-nine tons of bombs on enemy cantonments and bivouacs in the region of Lens and in the Valley of the Suippe and on railway stations.

"Captain Raymond, commander of the famous Stork Escadrille, has died in a hospital at Chalons-sur-Marne of injuries received in an accidental fall."

GERMANY

The German official for October 4 says:

On October 3 we shot down thirty-seven aeroplanes and two captive balloons.

On October 5 the German official said:

In the last two days sixty-five aeroplanes were brought down.

Berlin, September 26, via London.—Allied airmen lost seven aeroplanes in an attack on Frankfort-on-Main and Kaiserslautern, according to the German headquarters' statement to-day.

Great headquarters issued the following on September 28:

Yesterday we shot down thirty-three enemy aeroplanes.

On September 28 we shot down thirty-two enemy aeroplanes and three captive balloons.

We shot down forty-five enemy aeroplanes on October 1.

On October 1 we shot down twenty-seven enemy aeroplanes and three captive balloons.

ITALY

The Italian War Office has issued the following:

Our airships have bombed Primolano and Fucine.

Model Aeroplane Building as a Step to Aeronautical Engineering

The next and final part to be made is the rudder or vertical stabilizer. This part is fastened to the tail booms rigidly and is made of the same stock as the tail plane. Note the two cross pieces at the center with just enough space between to allow the tail to be inserted and fastened in place. The two uprights are fastened outside of the tail piece.

When covering, the fabric should be fastened to these center cross pieces and then down to the bottom or top piece.

The tail booms are made of spruce, 1¼", fastened to the ends of the tail booms for fastening to the rear spars of the wing assembly. The plate is fastened to the bottom side of the boom on the top spar and the top side of the boom on the bottom spar, as shown in the sketch to the right of side view. These plates are fastened to the booms and the spars by bolts for ease in assembling and dismantling. A sketch of the rear view is shown at the lower left-hand corner of the cut. This will clearly show the method of bracing in use.

A clip for fastening the wires is also shown. This clip is made of sheet steel. A small hole is drilled for the wire and a larger one for the bolt.

When glider is assembled, as shown in the two views at the right, the builder can test the strength of it by setting main section on two wooden horses and taking his place in the operator's space. The horses should be placed a point directly under the middle pair of struts, and taking care that the wing beams set firmly on the horses. If the wings show no sign of bending, it is safe to fly with the glider.

To fly, the operator can select a slight rising of ground with no obstructions, such as trees and the like, face into the wind, run to the edge of the hill and cast himself off. If balanced properly the glider will make a graceful glide to a point some distance away on the level ground.

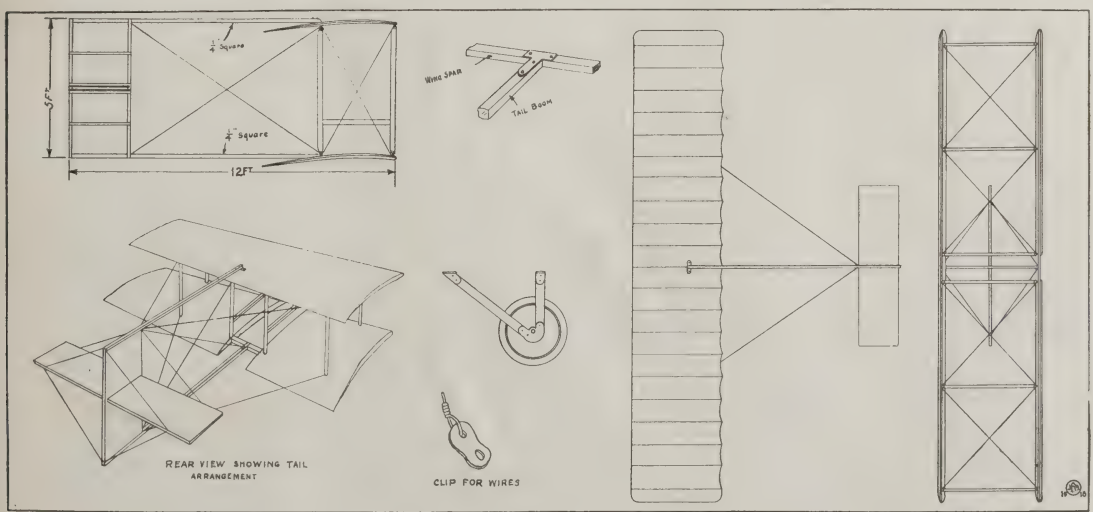
The writer would not advise trying this from a high hill at first, or when the wind is blowing too strong, as it is best to practice under less severe conditions at first until the operator knows how to control the machine.

The control of the glider is simple and needs but little practice. For instance, the operator hooks his arms over the two bars running from the forward to the rear struts. This allows his legs to move where he wishes to put them. The operator should locate his body as far forward as possible.

When in the air, should the right wing of the glider be lifted higher than the left, the operator promptly throws his legs to the high side, thereby changing the center of gravity so that the load moves to the high side and it falls back to normal, and the same should be done to the left side if that wing rises. The legs also control the rising and falling motion of the machine.

Should the builder wish to make towed flights, wheels can be affixed to the bottom wing spars at the center of the machine, by "V" shaped struts, as shown in the sketch.

The wheels and struts should be as light as possible in order to keep down the weight of the machine.



Don't attempt towed flights until you are well acquainted with every move of the glider when in free flight.

The weight of the glider, eighty pounds, might look heavy and the operator will think it is impossible to run with a machine of this weight, but this is a mistaken idea, as the curve of the wings is such that the slightest wind blowing against them will almost hold the machine in the air, with the result that the operator will have nothing to do but run and he will find himself lifted clear of the ground.

The operator will experience a wonderful sensation the first time he feels himself lifted clear of the ground, and after the first flight he will never be satisfied until he has a powered machine and can travel in any direction. It is well to remember that the Wright Brothers, Curtiss, Chanute, Montgomery and others got their first feeling in the air from a glider flight, and this is the real stepping stone to powered flight.

We will now take up the more important work of designing and building a powered machine.

(To be continued)

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

Wanted—Almost Anything

Dear Mother—Squadron life, they say,
Is fearfully exciting.
It's rot. For half an hour today
There wasn't any fighting.
They tell you War's a thrilling Game,
Ye gods, it's nothing if not tame.
Our fellows pulverized just now
A host of Hun formations.
And then they bombed—the Lord knows how,
A crowd of railway stations.
I can't think why the game's so slow,
There's still a war on, don't you know?
I chased a Hun a dozen miles,
And ultimately licked him.
The C. O.'s face is wreathed in smiles;
That Hun's my thirteenth victim,
But life is stagnant none the less.
(Hello! a bomb's dropped on the Mess.)
"As tedious as a twice-told tale"—
That's Shakespeare's own expression.
Monotony has made me stale;
I long for a digression.
I haven't crashed since yesterday,
When will adventures come my way?
If this is warfare, Mother mine
(Hellup, the roof has vanished).
Then give me back the days divine
Ere motor bikes were banished.
If this is war, then may it cease
And let's have an exciting peace.

Revenge

I have often thought
Of
The only way
To get back at
The censor.
Supposing that
You
And your Lieutenant
And your Lieutenant's
Fiancee
Came from the same town
And went to school together.
As he reads all
Your letters,
Why not keep up
His interest by
Writing
Passionate love letters
To
His Fiancee.
Oh, Joy.
Oh, Rapture.
Oh, Blisters.

MY SOLDIER

Now I lay me down to sleep
I pray the Lord my soul to keep.
God bless my brother gone to war
Across the seas, in France, so far.
Oh, may his fight for Liberty,
Save millions more than little me
From cruel fates or ruthless blast,–
And bring him safely home at last.

W.S.S. W.S.S.

Trans-Oceanic Float System For Airplanes

A SUCCESSFUL METHOD FOR PONTOONING THE ATLANTIC INVENTED BY ALFRED W. LAWSON

There are eleven strong reasons why the Trans-Oceanic Float System invented by Alfred W. Lawson should be established and put into operation at once.

1. It would enable us to send all of the airplanes we can build in America to Europe.

2. It would get airplanes from America to Europe in 90% less time than it now requires.

3. It would save the number of machines lost in the holds of torpedoed ships.

4. It would be the means of furnishing 24 hour service for mail delivery between America and Europe.

5. It would establish 24 hour passenger carrying service between America and Europe.

6. It would establish a safety lane for shipping between America, England, France, and Italy.

7. It would mean the saving of approximately $300,000,000 for every 50,000 airplanes sent across the Atlantic Ocean.

8. It will stamp the U. S. A. as the foremost nation of the world to put into operation the biggest of practical plans.

9. It will be the forerunner of commercial air navigation and rapid trans-oceanic traffic.

10. It will benefit every aircraft manufacturer in the world as well as increasing the efficiency and scope of the entire aeronautical industry.

11. It will bring all of the great nations of the world into close association with the U. S. A. and make this Country the source of supply to all humanity.

According to this system any airplane that is capable of flying and carrying more than one hour's fuel and oil can be flown across the Atlantic or any other ocean.

Any aviator who has graduated from a military training school will be qualified to pilot an airplane across the ocean according to Mr. Lawson's system, the chief requirement being that he knows how to make a good landing.

It will be easier for a pilot to fly across the Atlantic Ocean by this system than for one to make a cross country flight of the same number of miles, for the simple reason that by this system the landing place is always within sight and within gliding distance.

Briefly an outline of the plan is as follows:

Approximately 25 miles apart between the coast of America and the coast of Europe will be placed floats upon which the pilot can land and depart from, whenever he wants to descend for fuel or repairs.

These floats are to be approximately 500 feet long and 100 feet wide, but can be increased in length and width if preferred.

These floats are built in the shape of regular steamship hulls and are kept in their position of latitude and longitude by their own power.

These floats are protected from submarines by carrying longer range guns than the submarines carry and also by a system of nets which protect them against torpedoes. They are also further protected by the airplanes which carry a supply of bombs for that purpose.

In the holds of these floats are carried the supplies of fuel and spare parts for airplanes, as well as a repair shop, and sleeping apartments, and dining rooms, etc., for the pilots and crew.

The float contains a slowing up process whereby the speediest machines can be stopped within 300 feet and slow machines within 100 feet.

There are elevators arranged at both the bow and the stern of the float whereby airplanes can be let down into the hold and receive their fuel and repairs out of the way of other machines while landing.

The float is always headed into the wind so that the pilot always lands into the wind from the stern, while he is let down into the hold at the bow and then moved back in the hold of the stern again where he is elevated to the deck from whence he starts off on his journey again into the wind. By this method, airplanes can be landed and sent off again at the rate of one every five minutes.

On condition that each machine stops at every 4th float more than 1,000 airplanes can be transported from America to France every day that the weather is suitable.

It is estimated that there are more than 150 suitable flying days over the Atlantic Ocean during the course of a year, so that by this system it is possible to send to France more than 150,000 airplanes of every description in a year.

By this system airplanes can be sent across the Atlantic Ocean within twenty-four hours, or they can be sent from factories in the interior of the United States to the battlefronts in the interior of France within forty-eight hours, thus saving all of the material and labor necessitated in crating the machines at the factory and uncrating them and setting them up at the battlefields.

At the present time by steamship methods it requires more than thirty days to deliver airplanes from the factory in America to the battlefront, and therefore more than 90 per cent in time will be saved by this system in delivery of machines.

This system will also save the transportation cost of the pilots who will also receive some much needed practice in flying en route. If 50,000 airplanes were transported across the Atlantic by this system, that would mean a saving in shipping facilities for 100,000 more troops alone. It would also save enormous shipping facilities for other war materials that would take the place of the space occupied by the extreme bulky airplanes.

Besides the time and shipping facilities saved on the transportation of 50,000 airplanes an approximate saving in the cost of transportation will total more than $300.000,000.

This system can be put into operation within four months after it has been begun and Mr. Lawson is ready to give an actual demonstration of its practicability whenever called upon to do so.

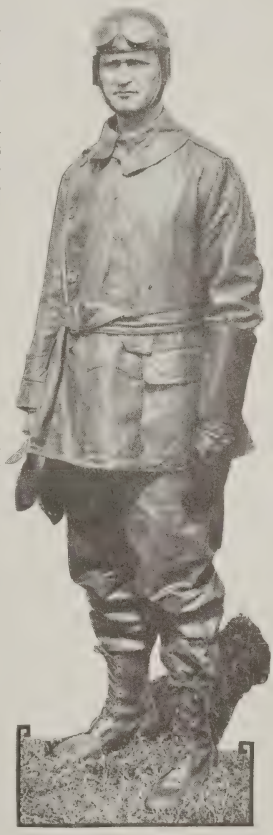
Many letters have been received from the leading aircraft engineers and manufacturers of the United States in which they say that they have examined Mr. Lawson's system and find it practical in every way.

The engineering force of the Lawson Aircraft Corporation are unanimous in their praise of the system, and the Lawson Aircraft Corporation herewith publicly advocate and recommend that the United States Government give it a trial and if found practical to utilize it at the earliest possible moment as one of the short cuts to the heart of the Kaiser.

THE LAWSON AIRCRAFT CORPORATION

GREEN BAY :: :: :: :: :: WISCONSIN

ALFRED W. LAWSON



:: *Vice-President and General Manager of* ::

THE LAWSON AIRCRAFT CORPORATION

Alfred W. Lawson, the Inventor of the Trans-oceanic Float System which enables an ordinary pilot to take any type or an overland airplane across the Atlantic Ocean or any other ocean by its own power has been for the last two years the Vice-President and General Manager of the LAWSON AIRCRAFT CORPORATION of Green Bay, Wisconsin.

During these two years, Mr. Lawson has given ample demonstratoin to the Directors of the LAWSON AIRCRAFT CORPORATION that he is most practical and conservative in all of his undertakings.

THE LAWSON AIRCRAFT CORPORATION manufactures only the latest types as well as the most practical airplanes, and as Mr. Lawson is a practical pilot of airplanes, as well as a builder of them, and as he has also spent a large part of his life at sea, the Trans-oceanic Float System was therefore invented by a man who based his plans upon the knowledge he had already gained by practical experience.

Alfred W. Lawson was one of the first of the pioneers of aviation in America. He began his active work in the movement in 1907 which was before the Wright Brothers made their memorable first public flights in France and the United States. In fact it was in 1908 that Wilbur Wright gave the first demonstration of the Wright Biplane to the French Government in France while Orville Wright during the same year demonstrated the Wright machine to the United States Government at Washington, D. C.

Just before these famous public flights were made by the Wright Brothers, Alfred W. Lawson founded his first Aeronautical Magazine, FLY, in Philadelphia and through the columns of this periodical he did the first missionary work for the aeronautical movement in this country.

After editing FLY for over a year Mr. Lawson went to New York and founded the magazine AIRCRAFT in 1909 and from that year until the fall of 1914 he was the editor-in-chief of that periodical. During that time AIRCRAFT established a reputation as being one of the foremost aeronautical magazines in the world and Mr. Lawson's writings on aeronautic subjects were quoted by aeronautic authorities in every country. It was, in fact thru the inspiration of Mr. Lawson's enthusiastic editorials and articles on the future possibilities of air transportation that started into the movement thousands of men who have since taken a leading part in development of the industry. Many of the present authorities on aeronautics in America are proteges of Mr. Lawson and manufacturers of most of the leading plants as well as aeronautical engineers, designers, managers, superintendents and foremen of these plants were urged into the business either directly or indirectly by Mr. Lawson.

Mr. Lawson's activities entered into every branch of aeronautics. He helped to organize the Belmont Aircraft Meet in 1910 and also the Chicago Meet in 1911—these being the two classiest aeronautical sporting events ever taking place in America.

In 1911 Mr. Lawson was associated with Henry Farman, the leading Aeroplane builder of France, who established in this country the Farman Company of America of which Mr. Lawson was President.

In 1912 he edited the aeronautical section of the Websterian Dictionary and introduced into that lexicon many new and original words including the word Aircraft. In fact, it was Mr. Lawson who actually coined the word Aircraft which is at the present time the most used aeronautical word in the world. This word was coined by Mr. Lawson in 1907 and in 1910 he had the word Aircraft registered in the United States Patent Office as a trade mark for the magazine he published.

In 1912, he was elected first vice president of the Aeronautical Manufacturers Association of America.

In 1913, Mr. Lawson learned to fly both the Sloane-Deperdusin and Moisant-Bleriot Monoplanes at the Hempstead Plains, L. I., Aerodrome.

The same year he purchased a Thomas Flying Boat and became distinguished as the first New York Air Commutor by flying from his country residence at Seidler's Beach, New Jersey, to the foot of 75th Street, New York City, a distance of 35 miles.

He has since then flown almost every type of airplane made in America.

During his career as editor of aeronautical magazines, Mr. Lawson outlined in his writings in advance practically every important step that has since taken place in the development of aeronautics besides making suggestions that proved of great value to the movement. He also went through a great deal of personal expense and inconvenience to petition Congress on different occasions to appropriate funds with which to establish a large American Air Fleet.

During the past year Mr. Lawson has been furnishing the U. S. Congress with a bi-weekly Bulletin concerning Aircraft information.

There is no man who has done more to advance Aviation in America than Alfred W. Lawson. There is no greater authority on aeronautics than he. His name is well known to every man in the aeronautical world, either at home or abroad.

MASSACHUSETTS

THE slowest speed at which an aeroplane can land is thirty-five miles an hour. Some of the largest machines weigh five tons and cost $60,000.

Unless the elastic Shock Absorber Cord is of the best quality to neutralize the shock of landing the aeroplane may be 'crashed' and the aviator killed. Our Shock Absorber Cord is the best insurance against such accidents.

We make Special Cords for Special requirements — Radiator Hose, Gas Hose, Molded Rubber Bumpers and Miscellaneous Rubber Items.

(*Continued from page 282*)

tremendous distance between the two wings, which would prevent one wing from competing against the other, brought about the conclusion to give two trophies instead of one.

The decision to have two trophies for the Naval and Marine Corps Air Stations was brought about by the fact that the tremendous distance between the Atlantic and Pacific Coast Stations would prevent competition between the two groups.

(4) Each of the four trophies is to cost $1,000.00, and with each trophy will be given five $100.00 Liberty Bonds, making five prizes of $100.00 each to go with each trophy. The idea in giving these Liberty Bond prizes was that while, under the rules of the competition, a station or squadron would have to win the trophy three times in succession to get permanent possession of it, the winning station or squadron would get a $100.00 Liberty Bond prize, immediately upon winning the contest.

It is left to the Military, Naval and Marine Corps authorities to decide whether the $100.00 Liberty Bond prizes shall go to the squadrons, or to the stations, or the individuals competing.

The Military and Naval officers who were consulted by the Aero Club of America authorities stated that the offer of these trophies and prizes would greatly add to the interest of the work of training and developing professional efficiency in the Air Service. They pointed out, in the event it were not possible to hold contests between squadrons or stations, it would be possible to award the trophies and prizes for the greatest efficiency shown by the squadron or stations in their respective work, during a given period of time. For instance, one station or squadron may specialize in formation flying, another in bomb dropping, another in cross-country flying, another in patrolling, etc. Each station or squadron keeps a close record of its work, thereby making it easy to figure the percentage of efficiency, and the station or squadron having the largest percentage within the given period of time, would be awarded the trophy and prize for that period.

In the event that the Military, Naval and Marine Corps authorities decide to hold the contests, or award the prizes, once each month, and the trophies are not won three times in succession by the same station or squadron, then the competition will continue until some one station or squadron does win it three times in succession.

(Continued from page 317)

Tail Group

The control cables to the upper elevator tillers pierce the stabilizer. The covering around these holes is then reinforced with leather washers to prevent wear. The fin is larger than was employed on the KB-2T. The stabilizer is braced with seamless steel tubing, the fin and rudder post with cable. Tillers are made of sheet steel welded to a steel plate. The elevator flaps and rudder are so constructed so as not to allow a space between them and members to which they are hinged, when their positions are changed. Tail measures 10′ 4″ x 3′ 2″. Elevator flaps 3½′ x 2½′.

Landing Gear

Regular "V" shape, with struts connecting to the body at points in line with front and rear wing spars. The tread is 5′ 3″ and wheels 26″ x 3″ are covered with linen covering "doped".

The landing gear is strongly braced with heavy stranded cable. The yoke for axle and plates for fastening to the fuselage are made of heavy sheet steel. The axle is nickel steel tubing 1½″ diameter with a ¼″ wall.

Elastic cord is used for absorbing the landing shocks.

Engine Group

A regular Curtiss O X rated at 100 h.p. is used, with a two-bladed Lang propeller 8 feet in diameter and 5 feet 4 inch pitch.

One fuel tank with a capacity of 30 gallons is mounted just behind the engine.

A Mayo radiator 3″ deep with a frontal cooling surface of 210 square inches is used. It weighs 53 pounds empty and holds six gallons of water.

Aeroplane Construction and Operation

In this book the author has succeeded in compiling an exceptional amount of invaluable material for the instruction of students, as well as for ready reference of the technical man and aeronautic engineer.

It is written in simple, concise language, starting with the most elementary principles of flight and explaining the construction of the aeroplane, finishing with the most complete calculations for the surfaces, power, weight, etc.

The following is a partial list of contents:

1. 429 pages. Up-to-the-minute data on construction, operation and calculations on aeroplanes. Dimensions and data on well-known machines.

2. 172 illustrations of assembled machines and details. 5 folding plates of machines and controls.

3. A glossary defining the latest aeronautical words and terms with their French equivalents.

4. **Lifting** surfaces, aerodynamic calculations, streamline bodies, etc.

5. **Training** and operating, explaining operation of control systems and methods of training students.

6. Military aeroplanes.

7. Tables of dimensions, with characteristics, weights, performance, etc.

8. Types of construction, arrangement and details.

9. Power, weights estimates, and general notes on the design.

This book is well illustrated with photographs, tables, diagrams and charts.

There is also a detailed diagram of a Blimp or scouting dirigible, with a key to the diagram, giving the names of the parts.

This book contains a large folding chart, giving a drawing of the de Haviland 4, also drawings showing the methods approved by the Government for handling the machine while "looping the loop," doing the "Immelmann turn," and other "stunts."

Aeroplane Construction and Operation by John D. Rathbun. Price $2.20, postpaid, from Aeronautical Library, 299 Madison Avenue, New York.

To Increase Officers' Pay

In the Senate of the United States on September 24, 1918, Mr. Penrose introduced the following bill, which was read twice and referred to the Committee on Military Affairs.

A bill to increase the rates of pay of officers of certain grades.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That hereafter the current yearly pay of officers of the Army of the several grades herein mentioned, exclusive of longevity pay, shall be as follows: Colonel, $4,500; lieutenant colonel, $4,000; major, $3,500; captain, $2,900; first lieutenant, $2,500; and second lieutenant, $2,200: *Provided,* That in no case shall the pay of a colonel exceed $5,500; the pay of lieutenant colonel exceed $5,000, or the pay of major exceed $4,500.

Sec. 2. That all laws and parts of laws in conflict herewith are hereby repealed.

TEN THOUSAND AEROPLANES ARE WORTH HALF MILLION TROOPS, SAYS BRITISH AUTHORITY

LORD SYDENHAM, British authority on fortifications, says in a message received by Major-Gen. Kenly, Director of Military Aeronautics, on October 18:

"Impress upon your people that 10,000 aeroplanes at this juncture are worth more than 500,000 troops on the ground, and will not require nearly so much transport. We can bring Germany to terms by air force, that is certain.

This comes as a timely request. Ten thousand bombing planes—the largest that can be built—can be produced in a comparatively short time in the United States. Many aircraft factories that are working at only part of their capacity because of lack of orders large enough to keep them going at full speed are ready to speed up. There are other firms going at full speed who feel that they are "rushing out of a job," because they have no orders to look forward to or to prepare for. And there are other manufacturers of component parts, scores of them, ready to fill orders.

There is, of course, going to be work for all—and more. Now that Second Assistant Secretary of War John D. Ryan is back, we may soon expect the word: "Go ahead!" Everything was waiting for his return.

SECRETARY JOHN D. RYAN OUTLINES AIRCRAFT POLICY

IN one of the official interviews during the past week, Second Assistant Secretary of War John D. Ryan outlined the aircraft policy.

Mr. Ryan said that the object of his trip to France with Secretary Baker was to acquire in the shortest possible time the best information regarding production and operation in the Air Service, not only of the United States or its Expeditionary Force in France, but of the allies as well, and to endeavor to bring to our own service whatever was found to be desirable and that would effect the best results. Continuing, he said:

Work of U. S. Airmen Commended

"Upon reaching France I went almost immediately to the front and was with our air forces during the St. Mihiel fight and also the one in the Argonne. I believe that in both these offensives the air forces were stronger in numbers and perhaps as high in efficiency as in any battle of the war. This opinion was expressed by both the French and British commanders as well as by our own. The air forces in both offensives were under the direction of the American commander, and while the French furnished a large part of the forces used and the British co-operated, the American squadrons made up about half of the number participating. The testimony of all commanders, both our own and those of the Allies, was to the effect that our machines were fought well and that our pilots distinguished themselves. Their commendation of the work of our pilots was tempered only by a suggestion that perhaps our boys were too venturesome and overcourageous, and I am inclined to believe that restraint more than anything else in the fighting of aircraft is necessary for our pilots.

De Haviland Planes

"The United States DeHaviland planes were in general use for observation and day bombing in both the St. Mihiel and the Argonne attacks and the pilots were to a man enthusiastic as to their performance, and while individual pilots and commanders had suggestions as to improvements and betterments that might be made, they were individual and seldom indicated anything more than a personal preference for some rearrangement of details. The commanders of all the squadrons using De Haviland planes as well as planes of British and French manufacture for like purposes, told me that the pilots in every case would prefer to take a De Haviland machine with a Liberty engine over the line rather than any machine of a like type. This is due to the fact that the machines is fast and for one of its type is quite maneuverable; that it climbs well and the pilots all agreed is a very efficient machine for the uses for which it is intended.

To Use All Manufacturing Resources

"In Paris and also in London I met at conference the heads of the air ministries of France and Great Britain, and the whole question of joint program both as to production and operation was gone into, with the result that the program now aimed at by the United States and the Allies is one that should utilize to the best advantage the facilities and the resources of all the countries on our side of the war in materials as well as in men. The air ministers of the other nations were all in accord in arriving at this understanding, and I came home pledged to them and they to me to carry out in the closest co-operation a combined program that has the approval of the commanding officers, as well as the heads of the air ministries of the other countries. The combined air services will be directed as the armies are, and while the commanding general of each of the nations controls his own air forces, he places it at the disposal of the commander-in-chief, just as he places the divisions of his army, and the result has already been seen in the great concentration of aircraft fighting at St. Mihiel and the Argonne such as has never been brought about in any previous action of the war.

Demand for Liberty Engines

"On my trip the Liberty engine was the cause of more worry to me than anything else because all of the allied nations were demanding more of them than could possibly be supplied. French, British and Italians have used the Liberty engine in their own machines at the front, and their building programs as now laid out are based to a considerable extent upon obtaining a supply of these motors in this country. I come home feeling that our allies consider the success of the United States in producing this engine in large numbers one of the greatest accomplishments in the war. Both the British and the French are now putting the Liberty motor in planes that formerly carried engines of either a heavier weight or less power. I can safely say that the Liberty engine, with its high power, combined with lightness, has greatly increased the efficiency of some of the planes that the Allies have been using at the front for some time. Their representatives even expressed themselves to me that it has made new machines of several of their old types.

Ten Thousand Motors Turned Out

"While I was abroad the 10,000th Liberty motor was turned out in Detroit. When you reckon that 10,000 of these en-

gines will develop 4,000,000 horsepower, you realize what it means to the air forces on our side to have them in such quantities, and that this total has been produced virtually since May 1, or in five months' work.

"From now on my effort will be so to lay down the policy of production and the training of pilots in this country as to perfectly fit such work into the combined program of the Allies, so as to put into operation at the front in the shortest possible time the greatest air power and efficiency in order to help win the war at the earliest day."

U. S. ARMY AIR PROGRAM PROVIDES FOR TRAINING 30,000 AVIATORS

THAT the U. S. Army Air program provides for the training of 30,000 aviators was made public on October 16 during the testimony of Colonel H. H. Arnold, of the U. S. Air Service, as given to the House Appropriations Committee. The following is from the New York *Times:*

"Colonel Arnold, who appeared before the committee together with Major Gen. Kenly, chief of the army air division, told the committee that 11,000 fliers have already been trained. During the testimony it came out that there are 8,390 American fliers in France and 6,210 in this country.

"Revelations of a 'scandal' in the purchase of cameras for the aeroplanes were made when it was testified that some one in the Aviation Department had been connected with a camera company which obtained contracts. It was implied that Chas. E. Hughes is looking into the matter.

"It was shown that General Pershing has such faith in the value of the military balloon that he doubled his orders for them. It also developed that Sandy Hook probably will be used for a repair depot for coast defense aeroplanes.

"Chairman Sherley of the Committee asked Colonel Arnold if there was any difficulty in obtaining candidates for fliers' commissions. The officer answered that every time a need for cadets came up more appeared than could be taken care of. He said that none, except a few men from the ranks, had been taken in since last December.

"Colonel Arnold said that the army plan was, as far as possible, to get university men, and this was a recent ruling of the War Department. Enlisted men were allowed to enter, and 1,500 of them had qualified, he said.

"Testifying on the Division of Military Aeronautics, Colonel Arnold said that there are now 39 balloon companies organized, and that 329 balloons had been produced to date. These, he said, would 'take care' of 162 companies. He said there were two balloons to a company.

"The disclosures concerning the cameras came out when Colonel Arnold gave the following testimony:

" 'When the photographic section first started in operation there was competition between three different firms, but for some reason or other there was some breath of scandal and that caused great delay in receiving equipment for several months. The Motlau Camera Company, the Eastman Company, and there was a third camera company, the name of which I have forgotten, bid on the cameras. It appears now that the camera which was accepted was not the most suitable for aerial photography.

" 'However, a certain number of them were purchased, and they are being used, but they are probably not as good as some other camera which might have been obtained at that time. The scandal part that came about was that a man in the Aviation Section was connected with the firm that was making the camera.'

"The Aviation Section purchased the Motlau camera, but at present, so the testimony ran, is buying a foreign-made camera and rebuilding it in this country.

"At present there are in the army air service 355 squadrons, and 450 are contemplated, according to Colonel Arnold. He said 9,000 enlisted men would be obtained in September, and these would supply about sixty squadrons.

" 'Just what proportion depends on what General Pershing asks for,' he said. 'In all probability it will be about fifteen or twenty squadrons more this month, and increased until by the end of November we expect to have them all.'

"Extra pay for the flying cadets was asked for during the hearings. When they first went into the service, candidates for commissions received extra pay, first of $100 monthly, and then $75, because of the hazard. This was eliminated, but the aviation authorities asked that the extra $75 be restored."

AMERICAN AVIATORS IN FRANCE

(*Editorial in New York Times*)

ASSISTANT SECRETARY OF WAR JOHN D. RYAN, in charge of aircraft production, has return from France and England with such a favorable report of his mission that there should be no more anxiety about America's contribution in material and aviators to the campaign on the western front. Perhaps the best news he brings home is the announcement of an agreement between the Allies to "pool their resources" and to provide for "unity in the air." Each commander, French, British, American, Italian, will direct the operations of his aviation force, but the combined forces will be at the disposal of Marshal Foch, who may call for concentrations and service at any point to execute his strategical plans. Unified command in the air as well as on the field is assured.

Before Mr. Ryan visited England and France some material was dispatched from the United States to be assembled in France, but there was no compact to "pool resources" and make the best use of labor and material for the common cause; all that seems to have changed; henceforth the Allies will waste nothing, lose no time in production, avoid duplications, and work in harmony toward the peak of production. They will be able, if the war lasts into next Spring and Summer, to overwhelm the enemy in the air, to prevent any reconnaissance at all by him, to smash his troop concentrations, to bomb and destroy his bases.

A few months ago, when American aircraft production was so behindhand that there were no bombing and combat planes of American make on the western front and not enough training planes to supply our large aviation force as organized, no one was disposed to believe that American aviators would take a conspicuous part in the Summer and Autumn offensives in France. It seemed fatuous to hope that General Pershing would have the American machines and enough American pilots, observers, and fighters. But, thanks to timely exposure of the deficiencies of production and to the rigor of investigation by committees in Congress, also to reorganizations undertaken by the War Department in response to public opinion, motors were at last produced in quantity, and a beginning was made in shipping to France aeroplanes all ready for use and materials to be assembled at the aerodromes. Let Mr. Ryan tell the story of what he was privileged to see at the front:

"I was with our air forces during the St. Mihiel fight and also the one in the Argonne. I believe that in both these offensives the air forces were stronger in numbers and perhaps as high in efficiency as in any battle of the war. This opinion was expressed by both the French and British commanders as well as by our own. The air forces in both offensives were under the direction of the American commander, and while the French furnished a large part of the forces used and the British co-operated, the American squadrons made up about half the number participating."

The only criticism of the performance of the American airmen was that they were too daring, took too many chances, and did not always make the best use of their opportunities; but the faults were largely virtues, and with more experience our airmen will have no superiors in offensive tactics. About the planes we are now building, installing Liberty motors in them, there cannot be two opinions. The Liberty motor, light and powerful, is so efficient that our Allies will take all that we can spare. The ten thousandth Liberty motor was completed at Detroit while Mr. Ryan was in France. A De Haviland plane equipped with this motor is always a prime favorite with the Allied airmen, because it is fast and climbs easily. An American built de Haviland flew from Dayton to Washington a few days ago in two hours and fifty minutes, at the rate of 143 miles an hour, and the pilot reported that he had no difficulty in holding his course true the entire distance. That is the kind of machine we are sending to the other side. No wonder England and France want the Liberty motor in quantities.

It is high speed and ease of handling that make the American planes so formidable on the western front. In group fighting with the Germans the American airmen are almost uniformly victorious. General Pershing's bulletins tell the same story every day, a story of unchallengeable superiority. If the war were to end tomorrow, it could be said that the American airmen had excelled in reconnoissance and combat. If the war should go on, the enemy on the American front would soon find himself driven from the air and helpless.

THE NEWS OF THE WEEK

Ryan Says Liberty Motors Have Passed the Ten Thousand Mark

Washington, D. C.—With the Allies unquestionably supreme in the air, definite arrangement has been made for a combined program of production and operation of aircraft in this country.

Unified war in the air will result, according to Assistant Secretary of War Ryan, in charge of our air program, who has just returned from France.

The aim of the unified program, Secretary Ryan said, "is to get the best results in the shortest possible time, and thus help to hasten the conclusion of the war."

Hereafter a policy of keeping secret the plans and figures on aeroplane production will be enforced.

Ryan said all pilots preferred American-made machines when available. He praised American pilots as equal to the best—quick witted, though perhaps inclined to be reckless and overventuresome.

At St. Mihiel and in the Argonne, he stated, there was a larger amount of American-Allied aircraft than in any other particular battle. He also stated that Liberty Motor production had passed the ten thousand mark.

Costly Country Club to Promote Aviation

Actuated by the patriotic impulse which has brigaded American big business into the national war plan, a group of men of first business importance in New York, Baltimore, Chicago, San Francisco and other cities have acquired a large tract of land at Lloyd's Neck, Long Island, for the purpose of extending the work of the Government in aviation and hydroaeroplane practice. The project, which has been completely formulated, is under the presidency of Reginald C. Vanderbilt, with Alan R. Hawley, President of the Aero Club of America, as one of his many associates.

For this purpose the Lloyd's Neck Club has been incorporated, with Mr. Vanderbilt as President. The Vice Presidents are Harry Payne Whitney and Lawrence Lewis Gillespie. Samuel Willets is the Secretary, and Henry Sanderson the Treasurer. Their associates on the Board of Governors are C. Oliver Iselin, Edwin D. Morgan, Frederick N. Watriss, Elbert H. Gary, General T. Coleman du Pont, Cornelius K. G. Billings, Leroy W. Baldwin, Frank C. Henderson, William Russell Grace, A. Kingsley Macomber, Arthur V. Davis, Roy A. Rainey, Nicholas F. Brady, William R. Coe, and William Goadby Loew. Mr. Watriss and Chares K. Beekman have worked out the necessary legal details of this club for national service.

The Lloyd's Neck Club property consists of 260 acres facing Long Island Sound a few miles from Oyster Bay and Huntington. It is about thirty-nine miles from the Queensboro Bridge, with fine roads for motoring leading to the point. On the property is a fresh-water lake covering ten acres. The location for schooling and post-graduate work in aviation and hydro-aeroplaning is therefore ideal. A farmhouse on the property, together with portable barracks, will furnish comfortable accommodations for aviators.

The expense of arranging aeroplane and hydro-aeroplane landings and practice fields is negligible, and to this essential end the officers of the club soon will be in communication with the National Government. Coal will hardly be needed, as a large supply of timber is part of the resources of the property and will be utilized.

After the war the Lloyd's Neck Club will become a great centre of outdoor social and sporting life, one of the largest, best equipped and most representative of country club plantations in the metropolitan district, although the governors will for all time maintain its identity as a phase of the Air Service of the Government. This national idea will be one of the basic principles of the organization. In the near future the clubhouse will be erected. An eighteen-hole golf course, 6,000 yards in extent, has been surveyed.

The plan calls for a polo field and a race course a mile in length, with grand stand, ample stables, and the encouragement of all forms of outdoor sport in summer and winter, with special attention to yachting. Just now the shooting on the plantation is excellent.

A certain number of persons not engaged in military or naval aviation will be enabled to join the club in the immediate future at moderate initiation fees and dues, for the purpose of building up a club fund, so that the Government may not be under expense. The aeroplane and hydro-aeroplane landings and practice fields will be for the free use of United States and allied officers.

Roland Rohlfs in 26,300 Feet Altitude Flight in Curtiss-Kirkham Triplane

According to a special despatch in the Buffalo Express, Roland Rohlfs, of Buffalo, experimental pilot for the Curtiss Engineering Corporation, on October 5 established a new record for altitude

Lieut. Sam Mustain, of California, who is now overseas

with load at McCook Field. He was flying the new Curtiss-Kirkham triplane.

Rohlfs is credited with a ceiling climp of 26,300 feet. He was in the air less than two hours. The climb was made with the use of oxygen tanks. The instruments on Rohlf's board recorded a temperature of ten degrees below zero.

Experts are highly pleased with the tests that have been made here of the new American invention. Rohlfs has been demonstrating the Curtiss-Kirkham innovation to selected groups of army and navy officers for the last ten days. His tests completed, he has returned to Garden City, L. I., where the Curtiss Engineering Corporation is located.

The Curtiss-Kirkham triplane and biplane, it is understood, embody new principles of fuselage and wing construction and an entirely new engine.

Remarkable in this altitude flight was the speed the engine maintained at this great height of five miles with the temperature ten degrees below zero.

Rohlfs's machine during the flight was loaded with two machine guns and their cartridge drums and other deadweight equal to the weight of an observer. Because of this extra weight the flight becomes as notable as that by Captain R. W. Schroeder at the Wilbur Wright Field on September 18. In a single-seated Bristol fighter Captain Schroeder ascended 28,900 feet. He was flying without weight. His climb has been certified as official after the most careful tests of his recording instruments.

National Advisory Committee Meets

At the annual meeting of the National Advisory Committee for Aeronautics, held at Fourth Street and Missouri Avenue, Washington, D. C., on October 10, 1918, reports of progress in the scientific study of the problems of flight were submitted by the Executive Committee and ordered published in the Fourth Annual Report, which will be submitted to Congress in December. The committee reviewed the present state of the art and adopted estimates for continuing further experimental and research work for the following fiscal year.

In the absence of the Chairman, Dr. W. F. Durand, who is at present in Paris, Dr. John R. Freeman, of Providence, R. I., presided. The officers of the committee and members of the Executive Committee were elected and appointed to serve for one year, as follows:

Chairman, Dr. John R. Freeman; Secretary, Dr. S. W. Stratton. Members of the Executive Committee: Dr. S. W. Stratton, Dr. J. S. Ames, Dr. J. R. Freeman, Dr. J. F. Hayford, Major General W. L. Kenly, U. S. A.; Professor C. F. Marvin, Dr. W. C. Sabine, Rear Admiral D. W. Taylor, U. S. N.; Lieutenant Commander J. H. Towers, U. S. N.; Dr. C. D. Walcott.

Immediately following the meeting of the full committee the Executive Committee met and elected Dr. C. D. Walcott Chairman of the Executive Committee and Dr. S. W. Stratton Secretary of the Executive Committee.

Liberty Motor Triumphs

Washington.—The British Air Mission in this country has handed to William C. Potter, Acting Director of Aircraft Production, a cablegram sent from London, under date of September 26, by the British Air Ministry reporting another satisfactory performance by an American Liberty motor in a test performance in England.

"After 100 hours' flying," said the message from the British Air Ministry, "one engine (Liberty) was stripped and found to be in very good condition. Tests have been made in the air in de Haviland 9-A and de Haviland 10 machines. Engines have performed uniformly satisfactorily in these tests. Information officially expressed four months ago to the effect that the engine would prove satisfactory in service is fully confirmed."

Plane to Bomb Berlin May Be Ready Soon

Washington.—Giant bombing aeroplanes capable of reaching and bombing Berlin, despite its distance from the fighting front, are being developed by British experts, according to information reaching Major General William L. Kenly, Chief of Military Aeronautics.

Whether Berlin will be bombed probably depends on the speed of the enemy in accepting the conditions precedent to an armistice and peace as laid down by President Wilson. The advance in Belgium and Northern France is daily reducing by many miles the distance between the fighting front and the German capital and important German industrial cities.

The difficulty has been to develop a plane capable of carrying sufficient gasoline to make the journey to Berlin and at the same time carry enough bombs to do substantial damage. The British are confident they have solved this problem.

Morane, Air Pioneer, Dies

Paris.—Leon Morane, the French aviator and aeroplane builder, is dead. Leon Morane during the autumn of 1909 and the spring of 1910 forged to the front of French airmen, finally becoming the premier ace of the period. In July of 1910 he established a new record for speed, and five months later he drove his machine to a height of 8,471 feet, at that time the greatest altitude attained by an aviator. He was injured in October, 1910, and afterward gave his entire attention to the construction of aeroplanes.

8,390 of Our Airmen Already in France

Washington.—The present army aviation program contemplates training 30,000 aviators. This became known on October 16 when testimony by Col. H. H. Arnold, as given to the House Appropriations Committee, was made public. Col. Arnold, who appeared before the committee together with Major-Gen. Kenly, chief of the army air division, told the committee that 11,000 fliers have already been trained. During the testimony it came out that there are 8,390 American fliers in France and 6,210 in this country.

It was shown that General Pershing has such faith in the value of the military balloon that he doubled his orders for them. It also developed that Sandy Hook probably will be used for a repair depot for coast defense aeropanes.

Chairman Sherley of the committee asked Col. Arnold if there was any difficulty in obtaining candidates for fliers' commissions. The officer an-

swered that every time a need for cadets came up more appeared than could be taken care of. He said that none, except a few men from the ranks, had been taken in since last December.

Col. Arnold said that the army plan was, as far as possible, to get university men, and this was a recent ruling of the War Department. Enlisted men were allowed to enter, and 1,500 of them had qualified, he said.

Testifying on the Division of Military Aeronautics, Col. Arnold said that there are now 39 balloon companies organized, and that 329 balloons had been produced to date. These, he said, would "take care" of 162 companies. He said there were two balloons to a company.

At present there are in the army air service 355 squadrons, and 450 are contempleted, according to Col. Arnold. He said 9,000 enlisted men would be obtained in September, and these would supply about sixty squadrons.

"Just what proportion depends on what General Pershing asks for," he said. "In all probability it will be about fifteen or twenty squadrons more this month, and increased until by the end of November we expect to have them all."

Extra pay for the flying cadets was asked for during the hearings. When they first went into the service, candidates for commissions received extra pay, first of $100 monthly, and then $75, because of the hazard. This was eliminated, but the aviation authorities asked that the extra $75 be restored.

Aircraft Hearings Ended, Hughes to Prepare Report

Washington.—Hearings in the investigation of aeroplane production by the Department of Justice practically were completed on October 11, and final drafting of the report will begin next week. Charles E. Hughes, who is conducting the investigation, declined to say how long it will take to complete the work, but it is understood two or three weeks will be required.

Deliveries of Aircraft Bombs

Quantity production five months after the first deliveries was the achievement of American manufacturers of aerial projectiles. Official announcement of this was made October 11.

First deliveries of the "demolition" and "fragmentation" bombs were made in April. Since then more than 3,000,000 of the projectiles have been turned over to the Government.—*New York Tribune.*

Air Raid Thrills Washington

Washington.—Word of the first great American air raid against the German camps north of Verdun sent a thrill through War Department officials on October 10, although no official report of details had been received.

So far as could be learned, however, the participation of 350 machines in this one enterprise marks it as the greatest air offensive yet undertaken on the Western front in point of number of forces employed. No record could be discovered here showing either Allied or German bombing raids on anything like a similar scale.

No official comment could be obtained pending the receipt of formal advices. There is every reason to suppose, however, that a considerable portion of the bombing planes used were De Haviland bombers, built in the United States and equipped with Liberty motors. Shipments of these machines to France have now reached considerable proportions, and recent performance reports from France have been encouraging.

The language of the account of the raid, permitted to pass by the American military censor, is taken here to indicate that the operation was a joint enterprise, with French and possibly British aeroplanes aiding in the protection of the Americans. The reference to fifty triplanes included in this great air fleet found no explanation here. If they were operated by American pilots they are French-built machines, and no details of the equipment obtained abroad by General Pershing have been released for publication.

The fact that only thirty-two tons of bombs were dropped by such a force struck some air service officers as surprising. The ordinary bomb capacity of a fleet of the kind described for such a short trip probably would be ten times that weight of explosives, it was said.

Air Service Citations

General Pershing has cited Second Lieut. Earl W. Porter, observer, Air Service. "For extraordinary heroism in action near Lassigny, France, August 9, 1918. Lieut Porter, with First Lieut. Charles Raymond Blake, pilot, while on a reconnaissance expedition at a low altitude and beyond the enemy lines, was attacked by five German battle planes. Although wounded at the beginning of the combat, Lieut. Porter shot down one of the enemy machines and by cool and courageous operation of his gun while his pilot skilfully manœuvred the plane, fought off the others and made possible a safe return to friendly territory."

Bombing Plane Reaches Utica

Capt. E. T. Waller, who started from Mineola Field early for Dayton, Ohio, in the Langley, the first large Handley-Page bombing machine built in America, arrived safely at Utica late in the afternoon, according to a message received by the Standard Aircraft Corporation at Elizabeth. He encountered strong winds. The Langley, which is driven by Liberty motors, was turned over to the Government July 6.

Fells His 109th Aero

Paris.—Lieut. Rene Fonck, according to an announcement made here on October 9, has brought down four German aeroplanes within twenty minutes on the same day.

Fonck now is credited with seventy official victories and has actually brought down 109 German planes.

Lieut. Brody, Aviator, is Reported Missing

Lieut. Alton Alexander Brody, Aviation Service, a formed student at New York University, is reported among the missing in France.

His father, Joseph M. Brody, who lives at the Hotel Brunswick, 22 East 89th Street, received the following telegram from Acting Adjutant General Harris at Washington:

"Deeply regret to inform you that Lieut. Alton Alexander Brody, Air Service, is officially reported as missing in action since September 15. Will report first information received."

Lieut. Brody enlisted in the army in April, 1917, and was one of the first men at New York University to enter service. He was at that time a student in the School of Applied Science at University Heights.

Airman Saved TNT from Fire

Washington.—Eight million pounds of TNT were saved from destruction in the recent fire at the Gillespie shell loading plant at Morgan, N. J., by an army aeroplane which flew over the wrecked works at an altitude of 1,000 feet and directed the fight against the flames.

The War Department announced the feat on October 16, disclosing that the plane was piloted by Lieut. Cyrus F. Smythe, with Maj. H. L. Armstrong as observer.

Aviator A. L. Gates Reported Missing

Washington.—Lieut. Artemus L. Gates, naval aviator and former captain of the Yale football team, has been missing since October 4, the Navy Department has been advised by Vice-Admiral Sims.

The message gave no details, and it was announced that the department has asked for additional information.

Aeroplanes an Aid to Wounded

Paris.—The aeroplane is now to be used to bring help and medical assistance to the wounded on the battlefield. "Aerochir" is the name given to this new type of messenger in a communication made this week to the French Academy of Medicine. It is the invention of a Russian engineer and scientist, Nemirovsky, and a French doctor, Tilmant; it has the indorsement of all the best French surgeons, including Dr. Carrel, and already plans for the formation of a first squadrilla are under way. An aerochir is used to carry the surgeon to the wounded. It is, in fact, a small first aid station in itself equipped with all the necessities for surgical and X-ray assistance. "Give me a shelter and some wounded and I can begin to operate at once," the surgeon can say, landing in no matter how remote or difficult a spot, or, if an operation is immediately necessary and the spot not actually under fire, the stationary aerochir can be used as an aid station. They had even at first thought of operating while in the air, but this proved impractical because of the instability of even the steadiest plane.

The plane used is a special triplane machine which carries, in addition to the pilot, a surgeon and an assistant. The power for a small sterilizing plant and for the X-ray apparatus is supplied by the motor of the plane, which is detached from the propelers and kept running.

The equipment, which, although necessarily limited, is sufficient for any immediate purpose, includes a light folding table of aluminum, so arranged that in an emergency it can be mounted on the aeroplane itself; a complete wash-stand, also folding; two smaller folding stands; two water containers, each holding twelve quarts of sterilized water; a sterilizer and a supply of sterilized bandages, gauze, linen, etc.

The first squadrilla of these "aerochirs" will be named the "Esqudarille Pozzi," in memory of the famous Dr. Pozzi, who was recently brutally murdered in his consulting room by a demented patient, and who before he died took the most vivid interest in the idea of these winged angels of mercy.

The Italian S. I. A. Biplane, one of the most efficient Italian machines

Officers With Ratings Below 45 Points

1. General Order 85, War Department, 1918, provides that—

"Whenever the average of a rating and revised rating of any officer falls below 45 points, the rating will be reviewed by the personnel board appointed under the provisions of paragraph 2, General Order 78, War Department, 1918. If the rating in question is verified by this board as falling below 45, the commanding officer will recommend to the Adjutant General of the Army that the officer in question be either

(a) Placed upon probation until next regular rating; or

(b) Transferred; or

(c) Discharged from the service.

"Any officer placed upon probation or transferred because of low ratings, the average of whose rating and revision at any subsequent time is less than 45 points, will be recommended for discharge from the Army."

2. It has been found that many officers whose rating falls below 45 points are serving in a branch or arm of the service for which they are not fit. The personnel adjutant will, therefore, draw from the file of officers' qualification cards the cards of all officers the average of whose rating and revised rating falls below 45 points. He will study the card and any other evidence to discover the qualifications underlying the officer's greatest success in civilian life and to state what branch of the service (if any) requires for its officers those qualifications. Cognizance will be taken of the officer's physical qualities, his intelligence rating and all civil and military experience. The personnel adjutant will attend the meeting of the personnel board when such cases are considered and will make a report and recommendations.

3. It is the intention of the War Department to transfer all such officers as in the opinion of the personnel board can be utilized to good advantage in different branches of the service, rather than to recommend their discharge. Careful review of each case is therefore imperative.

By order of the Secretary of War.

PEYTON C. MARCH,
General, Chief of Staff.

New Army Balloon School at Lee Hall

To complete the construction of the new balloon school at Lee Hall, Va., the allotment of $203,000 has been approved by the Assistant Secretary of War. This balloon school is for the training of officer observers in the control of artillery fire from observation balloons. Lee Hall will be a finished school for air service officers in aerial observation and will co-operate with the artillery stationed there. In this manner the officers will receive actual experience in artillery fire adjustments, directing the same from observation balloons, in the air, just as they will do at the front.

The completed plans for the new school include about 60 buildings, among them being a balloon shed, aero repair shop, garage, fire house, photo laboratory, as well as mess halls, barracks, school buildings, etc. The capacity of the school will be more than 1,000 men.

Major Harry R. Vaughn is the commanding officer.—*Exchange.*

New Record Flight

Lieut. H. H. Wells of March Field, with Col. W. N. Hensley, Jr., commanding officer of the Arcadia Balloon School as passenger, flew from Arcadia to Mather Field, Sacramento, in 5 hours and 45 minutes. Two stops were made en route, at Merced and Bakersfield. The time of the flight is a record for army planes over the same route.

Col. Hensley will remain at Mather Field to receive flying instructions.—*March Field Flyleaf.*

Service Stripes to Date from Arrival

The computation of time for the wearing of the gold service chevron will in future be made from the date of arrival at a French, British or other European port, according to a cablegram from Washington just received at G. H. Q.

In the past this time has been reckoned from the date on which the transport left United States territorial waters. Now, instead of counting from the first day out, we shall have to count from our first day in.—*The Stars and Stripes.*

Telegraphers Wanted

The War Department authorizes the following:

The Signal Corps needs seven hundred and fifty bonus telegraphers for service in France. Men skilled in telegraphy, between the ages of 18 and 55, inclusive, should apply at once for details to the Chief Signal Officer of the Army, Washington, D. C.

Requisitions have been received from General Pershing for 750 bonus Morse telegraph operators to be sent to France between now and June 30, 1919. One hundred and fifty qualified men are to be sent abroad immediately and the balance will go overseas at the rate of about 80 per month.

Men between the ages mentioned above, who are qualified, are needed badly at the front and unusual opportunities are offered them for early service. Bonus telegraph operators who enter the service will not be kept in training camps for instruction, but only for a sufficient time to outfit them with the necessary clothing and equipment.

Qualified bonus telegraphers who have physical disqualifications for active service will be accepted for this duty overseas. The Signal Corps states specifically that the physical standard will be lowered in cases of men having the necessary technical qualifications, so that practically anyone who is physically able to do this work will be accepted.

Aeroplanes Fly Over Liberty Parade

The parade on Fifth Avenue, New York City, on Columbus Day—Liberty Day; call it what you will—in aid of the Fourth Liberty Loan was nothing more or less than a bit of history. Very few people realized as they watched the different units and personages march by that they were looking at something the like of which the world has never seen before. Perhaps the only time when a parade closely approximating this one took place was in London, England, on the occasion of the late Queen Victoria's Diamond Jubilee in 1897. There were more troops in the jubilee parade, but at that time aeroplanes were not thought of as they are to-day. The parade on Liberty Day had just got under way when there appeared overhead formation after formation of aeroplanes. These flew up and down the parade throwing out Liberty loan literature.

De Haviland "Fours" appeared at three different levels. The lowest flew along at about two to three thousand feet. The steady roar of their Liberty Motors was drowned out in the cheering their appearance occasioned. De Havilands were also nying as high as twelve thousand feet and higher, their wings being just little specks of white. Besides the D. H. planes a number of training planes also flew along the parade. These planes came from the Provisional Wing at Mineola, Long Island. There were over one hundred altogether.

Aerial Observers Urgently Wanted

Washington.—General Pershing has sent an urgent call for air service observers, which the Aeronautical Bureau of the army is making prompt efforts to fill from civil life as well as from the army. A strong response from the daring spirits of the country is hoped for. There is no limit in the number to be accepted for training, and qualified men are certain to get quick action.

In announcing the needs of the expeditionary forces Major General Kenly, chief of the bureau, said there were no rigid age limits nor other limitations. It is up to the man himself. If he thinks he can stand the hard, dangerous service and can pass the rigorous physical and other tests, he will be trained for twelve weeks and sent over.

General Kenly said: "We will guarantee to get men who qualify to France without delay."

After reviewing the work of the aerial observers in the war and outlining how the results of their observations greatly facilitate the movement of troops and the artillery bombardments, General Kenly made public a letter from General Pershing to the chief of the American Air Service in France which without doubt refers to the great air raid north of Verdun in which 350 machines, probably a majority of which were American, took part.

For military reasons, no details of the operations could be made public here. But the letter, which explains itself, follows:

"Please accept my sincere congratulations on the successful and very important part taken by the air forces under your command in the first offensive of the First American Army. The organization and control of the tremendous concentration of the air forces, including American, French, British, and Italian units, which has enabled the air service of the First Army to carry out so successful its dangerous and important mission, is as fine a tribute to you personally as is the courage and nerve shown by your officers a signal proof of high morale which permeates the service under your command.

"Please convey to your command my heartfelt appreciation of their work. I am proud of you all."

Canada's Premier Ace Here from War

Lieut.-Col. William Avery Bishop, Canadian ace of aces of the British Royal Air Force, whose active fighting days ended four months ago when he was appointed to the British Air Board, has arrived at an Atlantic port on a month's visit to his home at Owen Sound, near Toronto, wearing the insignia of still another war decoration for valor in the air. His latest medal is the Cross of the Legion of Honor, first class.

In addition to his most recent decoration Lieut.-Col. Bishop has all of the French war medals. He has twice been decorated with the British D. S. O., and has won the coveted of all British medals, the Victoria Cross.

Douglas Fairbanks Flies to New York as Aerial Mail

It was quiet for Douglas Fairbanks on October 9th. The movie studios have shut down for a month because of the Spanish influenza, so there were no windows for "Doug" to vault through, no buildings up which to climb like a human fly, no chasms to leap with a running broad jump, no ruffians to knock about, no South American revolutions to stop single-handed.

Therefore, to repeat, it was a slow day for "Doug." All he did was to fly from Washington to New York in a Curtiss biplane with a 16-cent stamp on a tag in his buttonhole to indicate that he was classed as third-class mail matter, and then sell $2,000,000 in Liberty Bonds, indicating that he is a first-class bond salesman.

Fairbanks travelled in a regular mail plane piloted by Dana D. DeHart and was tagged as a parcel sent from the Postmaster of Washington to the Postmaster of New York. He left Washington at 11.45 A. M. and arrived at Belmont Park at 2.55 P. M., only a quarter of an hour behind schedule time.

The plane stopped at Trenton and Philadelphia and circled around all the other cities on the way, dropping Liberty Loan placards. Secretary McAdoo arranged the trip after Bernard M. Baruch had agreed to take a $1,000,000 subscription from Fairbanks if the actor got somebody to match it. The actor decided New York was the only place where he could do that.

On arriving here Fairbanks, dirty and greasy, without changing his aviator's togs, hurried to the office of Harvey Fisk & Sons, bankers, at 32 Nassau Street. He got the firm to match Mr. Baruch's subscription promptly.

New York-Chicago Aero Mail this Winter

In a letter to AERIAL AGE, Second Assistant Postmaster Otto Praeger says:

"I beg to advise that the New York-Chicago route will be established by the Post Office Department this winter, as soon as sufficient machines can be obtained and landing fields completed. Fields are now being laid out at Chicago, Ill., Bryan, Ohio, and Cleveland, Ohio, for this service, and the route will probably be in operation by December 1st. It will be a ten-hour run, including all stops, and will carry approximately 20,000 letters on a trip."

As Others See Us

Quite a lot is being heard just now about aerial mail services, more particularly in neutral countries. A newly formed company intends to inaugurate a mail service between Madrid, Barcelona, and the Balearic Islands; it is to develop eventually into a passenger service. No subsidy is asked for, but merely the provision of authorized landing places and permission to stamp mails carried, according to the Ministry of Public Works.

Its Possibilities

This project is likely to attain some measure of success, not financial, but utilitarian success. First of all, it is out of the sphere of the war, and, in the second place, it may provide an immunity from submarine risks. What the capitalization is to be and how much profit is expected out of the services we are not told. But Spain is reeking with gold, thanks to the neutral benefits derived from the war, and one can scarcely believe that the provision of the necessary capital at a comparatively low cost will be at all difficult.

Aerial Mail Service

By the way, some appropriate calculations have appeared in the daily press in connection with the commercial basis of an aeroplane passenger and postal service. With a capital of $2,500,000 a service of 24 machines could be provided. On a non-stop flight of 400 miles and a minimum service of six medium-sized 300 horse-power machines, carrying 4,000 lbs. of revenue-earning load in addition to the pilot, mechanic, and petrol necessary for a five-hour flight, the cost per ton mile would work out about 45 cents. It would be commercially possible to carry six passengers at 5 cents per mile, while letters could go 800 miles for less than 2 cents per oz.

Promoters May Be Busy

Statistics, according to the cynic, can be made to show anything and prove nothing, according to the point of view. There is something in this. One can scarcely expect these estimates to convince the average man; they are not exhaustive enough; there is an absence of detail sacrificed, one supposes, because detail would prove too dry for the average reader. But it is surprising how people are beginning to realize that aeroplanes have commercial possibilities, just as it has been proved that there military potentialities are great. One wonders if this will continue, and if, on the return of peace, the company promoting fraternity will work on this topic to the disadvantage of the Aircraft Industry, and the gullible public, and to their own pecuniary profit?

Aeroplane Postage Stamps

Mails carried by aeroplane, according to a regulation just announced by the United States Postmaster-General, will be charged with postage at the rate of 16 cents for the first ounce or fraction thereof, and 6 cents for each additional ounce or fraction, of which 10 cents shall be for special delivery service. Such mail shall consist of matter of the first class, including sealed parcels not exceeding 30 ins. in length and girth combined. The postage on

Note.—Depreciation is not estimated in this report, for lack of convincing data, but is reflected in the items under repairs, parts and labor.
Items for rent, light, power, etc.; misc.; dead time of pilots; time of hangar men, misc.; shop time of mechanics; interest on investments; and departmental overhead charges; all of which are not directly apportionable to individual ships, are pro-rated equally between all of the ships.

MILITARY AEROSTATICS

By LIEUT. H. K. BLACK, R. F.C., C.F.A.

Commissions Offered in the Balloon Service

Commissions are offered in the Balloon Service, which, like the other branches of the Air Service, is to be greatly extended.

Interesting information with regard to the formation and equipment of balloon companies for the army overseas is contained in the hearings on the deficiency bill before the Appropriations Committee of the House, recently made public.

While the army now has sixty-nine balloon companies, it is proposed to have 175 companies by June 30, 1919, each company being equipped with two balloons, so that while one is down being repaired the other may be in the air.

The balloons are used in the army for observation purposes and are sent up from various distances behind the front lines as captives. Each balloon is equipped with parachutes in order that the observers may leap to safety when attacked by hostile airplanes or are hit or are in danger of being hit by shrapnel.

The balloons signal to the artillery on the ground, giving information relating to ranges, &c., telling when hits are made and when to increase ranges to keep from hitting American troops. In addition balloons are used to make observations of concentrations of enemy troops, to report enemy movements and for dozens of other purposes.

This Government has had no difficulty in getting all the balloons it wants, it was brought out in the hearing, and has been supplying its surplus balloons to the British Government.

Elementary training in balloon observation is given to observers and mechanics at Camp John Wise, San Antonio, Tex., and when the men have completed their preliminary work there they are sent to one of four other schools, where the advanced course is given.

Of the advanced schools, that at Fort Omaha, Nebraska, is the only permanent one. A permanent hydrogen plant, the only one in the country, has been erected there, while balloons at other schools are usually filled from gas supplied by gas cylinders which are shipped to the stations.

The school at Fort Sill, Oklahoma, is for the training of observers who are to be connected with the light artillery, while the school at Lee Hall, Va., is used for observers connected with the heavy artillery. The school at Arcadia, Cal., is for mechanics and for miscellaneous observation work.

Each balloon company is equipped with complete motor transportation in order that the balloon and necessary equipment may be transferred rapidly from one place to another. Included in the motor equipment are eleven three ton trucks, six one and one-half ton trucks, two kitchen trailers, four motorcycles, one touring car and one balloon tender chassis. This equipment, at current prices, costs $63,100.

IF my memory serves me aright, it was early in 1917 when the practice of putting swinging seats in the observation balloon baskets came into vogue. These seats are merely a strip of canvas bent onto two short pieces of wood and the pieces of wood suspended from either side of the basket. There is nothing to them, of course, but when they were introduced they caused several different opinions to be rather explosively brought to light. I remember the first basket we had received in which these seats were fixed. As it happened, several of the officers of the section were present when the brand new balloon was unloaded from the motor truck. The company commander was also among those present. One of the officers had his attention drawn to the innovation by the basket corporal. This officer was one of those who firmly believed that comfort was absolutely necessary to efficiency and that so long as he did his job satisfactorily it did not matter how he accomplished it. He made a remark audibly to the effect that from now on we would be able to sit at our ease while we were strafing the festive Hun. The major happened to hear his remark and upon closer inquiry discovered the cause thereof. His opinion was that the Army was not what it used to be in the good old days. Now everybody was looking for soft jobs and that he for one would not use the seats, and that he would advise very strongly against their used by any of the rest of us. As the seats were rather flimsy looking affairs and as he weighed somewhere in the neighborhood of two hundred and eighty pounds, standing six feet five, perhaps he had another reason for not using the new seats. Two or three days later, when the new basket had been put in use, another reason against their use came to light from an altogether overlooked point. As it happened, the writer was making a flight that day, and after sitting up at about thirty-five hundred feet for three hours, doing very little on account of very low visibility, we were made the victims of an attempt at Hun "frightfulness." A Hun plane came over with the evident intention of destroying our peace of mind and incidentally our balloon. For once our aeroplanes were about. There were lots of them, and they pounced on Fritz and spoiled his little game. Our "Archie" barrage also was working to perfection. However, as soon as the Hun appeared, we, in the basket, as those most vitally interested, discovered him first and immediately made our preparations to descend, via the parachute route. How were we to know that our aeroplanes were round in large numbers. There had been times when a balloon had been attacked by a Hun that all our planes seemingly had gone home for tea. At all events, we were not obliged to take to our parachutes, but after the danger had passed and the Hun had been chased home we discovered that had we had to jump, one of us would not have reached the ground safely. We had both toggled on to our parachutes when we ascended, and while we had been sitting up there, we had fixed our canvas seats. While not in use they hung on one side of the basket. As I said, when the Hun had been chased home, we found that the parachute harness of one of us had led from the parachute into the basket, *underneath the canvas seat* and then to our harness. If we had had to jump, one of those parachutes would have been dragged into the basket and certainly would not have opened if it would have come loose at all. The knowledge that the seats were a source of danger in that way we bought very cheaply. As a rule, experience in the balloon game generally costs more than that. The less there is to think about in clearing a parachute harness the better and the bigger chance of escape there is. After that we made it a rule that when we used the seats we would make sure at the time of adjusting them that they were clear of the parachute harness. These seats do not deserve the amount of space which has been given them, but for the reason given above we have enlarged upon them.

An American-made Caquot in flight

What is known as the optical equipment of the basket consists of binoculars only. We made experiments with a high powered telescope, but found it almost impossible to work with. It is true that under ideal conditions we were able to work with one, but when there was the least wind it could not be kept on the target. Telescopes are not a part of the basket equipment at all. The idea that they are in common use is a widespread fallacy among laymen. With a high-powered binocular it is possible to do better work than with any telescope.

The basket is equipped with glasses of varying powers. For ordinary observation and picking up targets, as well as when beginning a shoot, a pair of 6 power or 8 power glasses are generally used. This is so because of the greater view one gets with a comparatively low powered glass. In beginning a shoot it is necessary to see considerable of the country surrounding the target, else if a round landed several hundred yards away from the target, it would be outside of the vision of the glass and be lost. Indeed, it is quite a common practice in observing the first round or so of a shoot to dispense with the glasses altogether. So as to be sure to get the first round of a series. The high-powered glasses, 10 power, 12 or sixteen power, are of greatest use in picking up the detail of a target when one is trying to identify a certain point, or when one is right on the target and shooting for demolition effect. It used to be the practice for each observer to ascend with three or four pairs of different powered glasses. However, when we had a balloon break away on us one day and drift over in the general direction of Berlin, we found that we were short six pairs of glasses. Glasses were very scarce at that time, too, good ones were more so. Of course, the observers threw out the glasses with the rest of the basket equipment. The glasses or what was left of them were no doubt found by the infantry. The infantry, of course, immediately hunted out the section which had lost them and returned them to us—I don't think. After that we never took up more than two pairs of glasses, one low and the other high powered.

The AIRCRAFT TRADE REVIEW

Splitdorf Victory Meeting

Lieutenant F. Farquhar, discharged wounded British army officer, formerly connected with the Army Signal Corps of the British Army in France, gave a rousing address to his fellow employees of the Splitdorf Electrical Company in the factory yard, 98 Warren Street, at what was designated the Splitdorf Victory Meeting.

Limping somewhat badly from a shattered leg, slowly coming back into use, Lieutenant Farquhar, who went to the front from his position with the Splitdorf Company's London headquarters, dwelt upon the importance of the work of every employee in the factory in winning the world war. "Remember the lives of thousands of brave men depend upon the ignition systems in aeroplanes, motor truck, motorcycle, tanks and whippets, as well as the submarine chasers, and all Splitdorf men in a measure are responsible for these lives," he declared. Continuing, he pointed out the vital importance of conscientiously performing their duties, no matter in what department they happen to be located, and explained the importance of the most minute details of manufacture in actual performance on the battlefield.

He was explicit in the statement that each and every one in the factory was "doing his bit" without a doubt, if that "bit" was the making of ignition devices that in their place would help drive the German beast back toward Berlin. This was received with cheers, and when the meeting developed into a rally for the Fourth Liberty Loan and Lieutenant Farquhar said he was proud and honored to be the first factory subscriber he was greeted with a rousing acclamation. Lieutenant Farquhar announced that he was returning to London in the near future to resume his duties with the Splitdorf Company and he voiced the wish that he could carry the message back that Dixie Magneto makers were working every hour of the twenty-four, not only in turning out magnetos for the big victory, but lending their hard-earned money in the cause of liberty, of righteousness, and justice.

That the prediction of the workman came true was confirmed by the late reports, which indicated that the Splitdorf Electrical Company employees had gone "over the top" with subscriptions of over $125,000 for the Fourth Liberty Loan.

Y. M. C. A. Aeroplane School Moves

The Y. M. C. A. Aeroplane Mechanics School was conceived along the latter part of the summer of 1917 under the direction of Mr. F. S. Gostenhofer; but classes did not begin until November of that year, with a faculty of five members. It was through the efforts of the Aero Club of America that the school received its first equipment, consisting of a Curtiss O. X., a six-cylinder Maximotor, a Thomas Scout biplane complete, and a Standard fuselage—besides a number of spare parts and wings. From the very beginning the school was successful, and ever since then its history has been one of constant growth. Nothing can show the marvelous development better than to compare the payroll of the first month, which amounted to $589.00, with that of October, 1918, which amounted to no less than $6,400.00. To-day the personnel of the school consists of fifty-seven men. Early this year under the leadership of its present principal, Mr. F. F. Tenney, the school outgrew its present quarters at 240 West 52d Street and it was decided to lease a floor in a large building at 239 West 56th Street, where sufficient space for aeroplane work could be found, the former floor being retained for the motor department.

In July the valuable equipment of the Claymont School of Aviation was presented by Colonel Irenee Dupont—again through the efforts of the Aero Club of America, the officers of which directed Mr. Dupont's attention to the wonderful work which the school was doing in training men for the service of Uncle Sam.

At the present time the school is preparing an average of 600 men per month, about 40% of whom go into aircraft factories after graduation, while the rest join the aviation sections of the Army and Navy. This growth has made it imperative to secure larger quarters again, and a location has been found comprising three floors on Broadway and 56th Street.

The present equipment of the school is as follows: Ten Curtiss O. X. engines, 1 Hispano-Suiza, Model "A"; 1 Mabimotor, 6 cylinders; 1 five-cylinder Anzani, 3 fifty H.P. Gnomes, 1 Sectional Monosoupape Gnome, 1 Thomas, 130 H.P.; 1 six-cylinder Hall-Scott (loaned), 1 twenty-cylinder Anzani (loaned).

The plane department has the following equipment: 1 Curtiss J. M. 4, 1 Thomas D. 5, 1 Thomas Scout biplane, 3 Curtiss Model "F" flying boats, 1 Gnome engined looping biplane, 1 Standard fuselage, 1 Wright-Martin seaplane (loaned), number of spare wings, panels and miscellaneous parts.

American 'Plane Makes a Successful Flight

Elizabeth, N. J.—Captain E. T. Waller, British R. A. F. aviator, who left Mineola Field on October 15 in charge of the Langley, the first large Handley-Page bombing machine built in America, arrived safely at Utica, N. Y., en route to Dayton, Ohio, according to a message received by the Standard Aircraft Corporation. Captain Waller reported strong winds were encountered all the way across New York State.

Langley, which is driven by Liberty motors, was turned over to the United States Government July 6.

Those flying in the Handley-Page are: Captain Waller, A. Livingston Allen, navigator; Lieutenant Beck, U. S. A.; Lieutenant Everson, R. A. F., and three mechanics.

The detailed report of the flight will be printed in the next number of AERIAL AGE.

Personal Pars

Donald R. Black, formerly Chief Draftsman of the L-W-F Engineering Company, is now in the Air Service, U. S. A:, having been inducted by his request. He is assigned to Langley Field, Hampton, Va.

Mr. Black's interest in aviation dates back to 1910 and he was connected in turn with the Curtiss, Schmitt, Aeromarine and L-W-F companies during the past three years.

Watson Called to Important Post

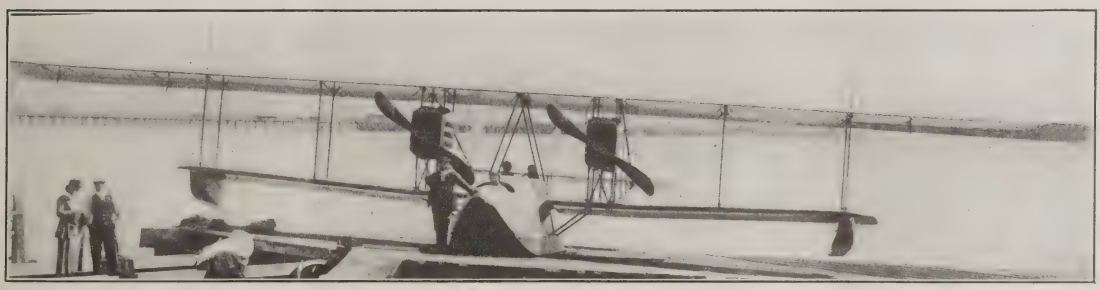
John W. Watson, president of the American Bronze Corporation of Berwyn, and former chairman of the Pennsylvania Section, Society of Automotive Engineers, has just been appointed assistant chief of the Hispano-Suiza Engine Section of the Bureau of Aircraft Production. In the absence of Mr. B. D. Gray, chief of the Hispano Section, Mr. Watson is entirely responsible for the administration of this particular section, which includes all engineering, production and inspection activities for the Government in connection with the production of about $80,000,000 worth of Hispano-Suiza engines and spares. Mr. Watson wil make his headquarters in New York City.

During the past year the Hispano-Suiza engine has made it possible for French planes to retain air supremacy, and it is a matter of record that of all the German planes destroyed during that period by the French Air Service, the Hispano-Suiza engine is credited with 90 per cent of the total brought down, the remaining 10 per cent distributed among the balance of all other engines in use.

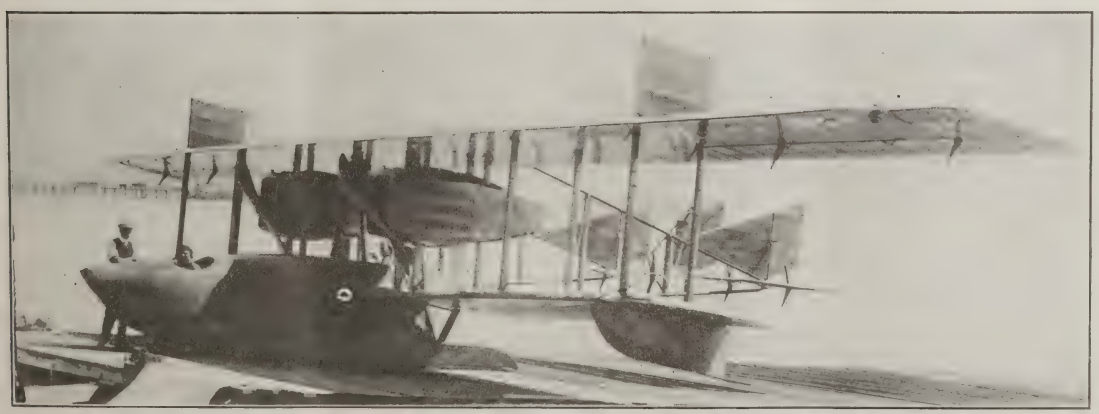
The Curtiss Engineering Corporation plant at Garden City, Long Island, N. Y. On the right is the administration building, in the center the workshops, on the left the recreation building

LOUGHEAD PLANE TO FLY ACROSS CONTINENT

THE Loughead Aeroplane, which recently completed a trip flight from Santa Barbara to San Diego, a distance of approximately 300 miles, is being made ready for a transcontinental flight to Washington, D. C. The start will be made from the naval training field on North Island, across the bay from San Diego, about October 20. The aeroplane will carry four passengers, including the pilot, and a mechanic, a large amount of mail matter, addressed to Government officials, members of Congress, and prominent eastern men, and enough gasoline for twelve hours of continuous flying. It is expected the transcontinental flight of 2,100 miles to Washington, with only one stop at a Mississippi Valley point, will be made in 30 hours.



This proposed flight, which from the earlier performances of the Loughead machine in the air may be accepted as an accomplishment, is the longest non-stop and also the most rapid long distance flight ever made by a heavier-than-air machine, with so many passengers and carrying so much additional weight. It will have a live load of 2,522 pounds, which, added to the weight of the machine and equipment, will bring the total weight up to more than 6,150 pounds.



Early this spring the Loughead Aeroplane, Model F-1, which was built in Santa Barbara by the Loughead Brothers and a company of local capitalists, made a successful flight from this city to San Diego, carrying four passengers. It was then equipped as a flying boat, starting and landing on the surface of the ocean. The machine is now being altered by fitting a new body, landing gear and wheels, to permit of landing in a field instead of on the water. Otherwise the aeroplane is identical with the one which made the San Diego flight and returned at Santa Barbara recently, after numerous cross country flights from the San Diego flying field with army and navy aviators aboard.

Powered with twin Hall-Scott Aeroplane engines of the A-5a type, made by this pioneer Pacific Coast aeroplane engine building concern, the Loughead twin motored, model F-1-A will have a maximum speed of 100 miles per hour. Its minimum speed is 45 miles. The two Hall-Scott engines are so mounted and controlled that either correction of the rudders. With the live load of 2,522 pounds and only one engine running, it will maintain a speed of 62 miles per hour.

As much of the flight will be made at night, special luminous dial instruments will be installed in the pilot's compartment of the body, to assure the aviator knowing his direction, altitude, etc. The

Two views of the Loughead twin-motored flying boat powered with Hall-Scott motors

THE FRENCH A. R. BIPLANE

(The following illustrated description of the French "A. R." machine has been translated from a German contemporary, and should be of considerable interest, inasmuch as one is not permitted to refer in detail to the modern aeroplanes of the Allies until the enemy has isued a report.—Ed.)

THIS machine, designed by Dorand, is designated as A. R. or A. L. D., according to whether it is fitted with a Renault or with a Lorraine-Dietrich engine. The particular machine under review is marked A. R., Typel, and the number is 309. The machine is a two-strutter biplane of 13.30 m. span, and has its fuselage supported between the planes on ash struts. Sweep-back and dihedral angle are only present in the lower plane. The former amounts to 1 deg., while the dihedral angle is 2 deg. The top plane is staggered backwards 0.5 m. The gap is 1.825 and 2 m., respectively; that is to say, in the centre it is 0.945 of the chord. The angle of incidence of the upper plane is 2.5 deg., that of the lower plane 3 deg.

The halves of the wings are screwed together in the centre of the machine. The wing spars appear to be of one section, covered on both sides with three-ply. Between every two ribs, whose spacing is 300 to 340 mm., is a short false rib on the top surface only, running from the leading edge to the front spar. The wing fabric, which is of a cream color, is sewn to the ribs. In front of the trailing edge, which is formed by a wire, as in all French machines, eyelets are incorporated.

The plane struts, which, with the exception of those secured to the body, are of hollow section, are of stream-line form. In order to prevent lateral bending the outer plane-struts are provided with a peculiar bracing. In addition the middle of the struts are braced to one another and to the bottom of the body struts. The strut fittings are of a very simple type, as shown in one of the illustrations. Strut sockets of sheet steel are secured to the spars by U bolts, the two shanks of which pass through the spar and are secured by nuts on the other side. The flying wires and landing wires are anchored to the corners of these U bolts, while the incidence wires are secured to lugs projecting from and forming part of the steel plate bottom of the strut sockets. This bottom is simply resting inside the socket and is not secured in any other way.

The wing bracing consists of solid wires throughout, which are connected to the fittings and turnbuckles in the usual way by bending them over and sliding a ferrule of spiral wire over the free end. The flying wires are in duplicate and lie one behind the other. The space between them is filled with a strip of wood. The external drift wire running to the nose of the body is wrapped with thin cord to prevent it becoming entangled in the propeller in case of breakage. Between the fuselage and the lower plane there is diagonal bracing in the plane of each spar. As, however, there is no corresponding bracing above the fuselage, the upper ends of the top plane body struts are allowed a considerable amount of play.

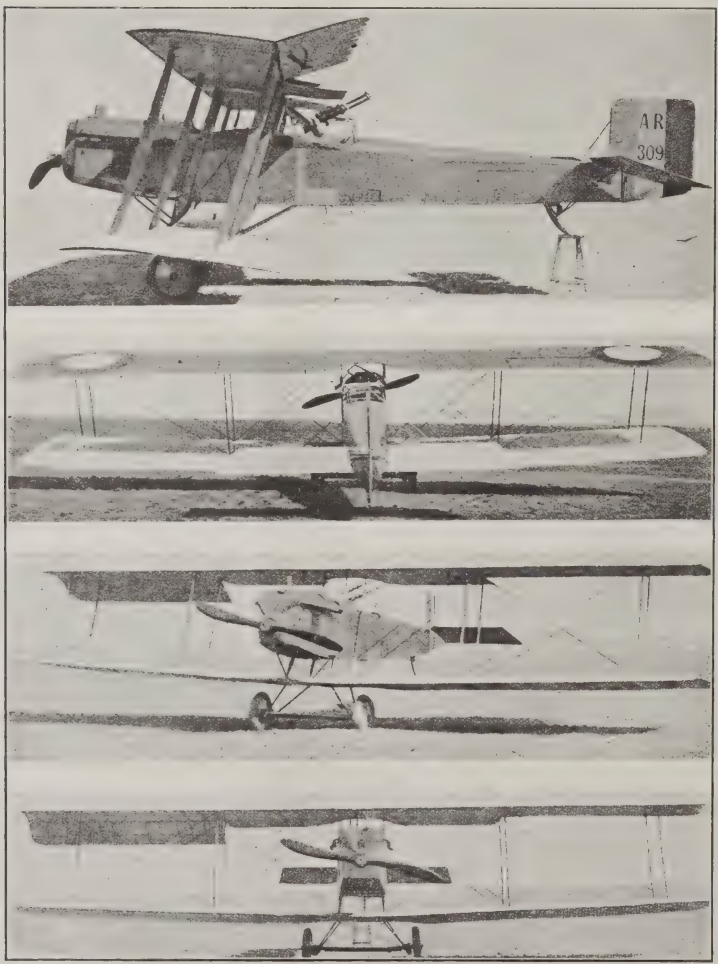
Non-balanced ailerons, positively operated, are hinged direct to the rear spar of the top plane only. The aileron control cables are in the form of simple cables running from the sprocket wheel on the control column, around pulleys in the lower plane, along the lower side of the lower plane and under another pair of pulleys. From this point on they are in the form of solid wires of 2 mm. diameter running to the aileron crank levers, which are in the form of quadrants. The upper cranks of the ailerons are connected by cables and wires running across from side to side, along the upper surface of the top plane.

At the stern of the fuselage is fixed a small tail plane to which is pivoted the balanced trapezoidal elevator. The rudder is also balanced. The rudder post is braced to the elevator, and this in turn to the body, by stream-line steel tube struts. The ends of these struts are flattened out and bolted to the various fittings. There is no vertical fin. The rudder is controlled by plain wires of 2.5 mm. diameter. Only where they pass over pulleys have cables been substituted for the wires.

The undercarriage struts are secured to the spars of the lower plane at the points where occur the attachments for the struts running to the body. The short body struts are braced by stream-line tubes fore and aft to the body. The one-piece axle rests between two cross struts of steel tube. The travel of the axle is not restricted. The undercarriage is braced diagonally in the plane of both pairs of struts.

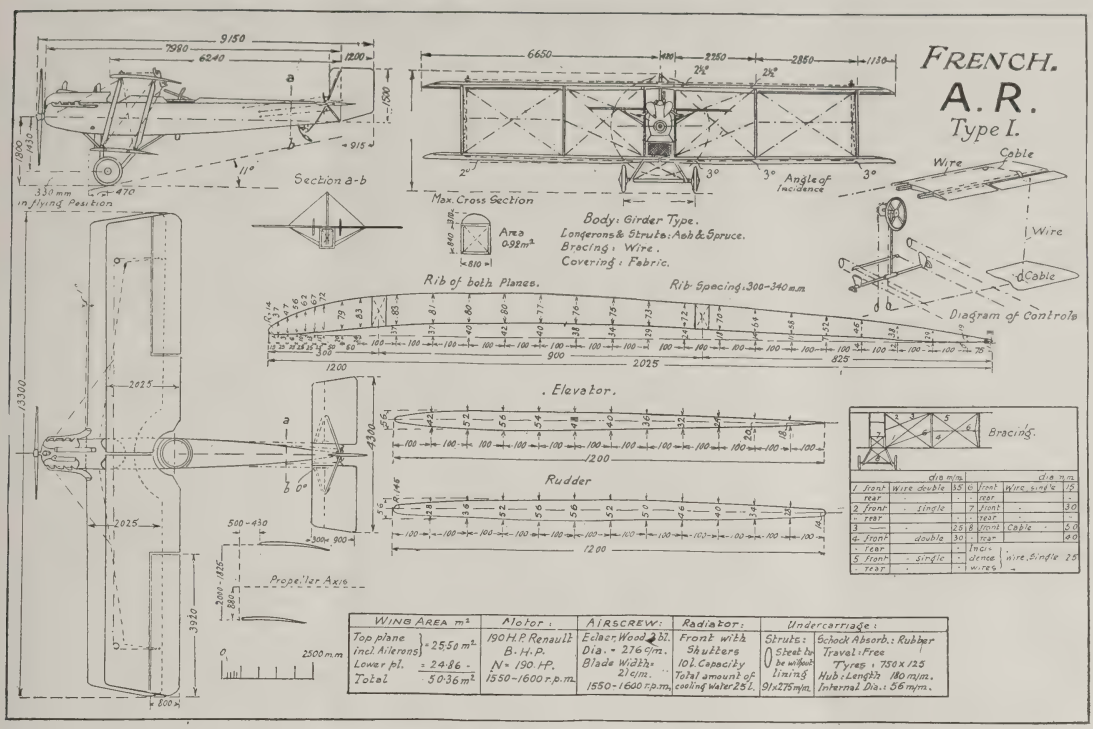
The longerons and struts of the fuselage, which is fabric covered, are made of ash up to the observer's seat. From there they are made of spruce. The struts of the rear portion of the fuselage rest on the longerons without any attachment, and are held in place by the bracing only. To prevent them from sliding along the longerons the ends of the struts are notched to correspond with the shape of the wiring lugs, which surround the longerons.

The 8-cylinder, Vee type Renault motor develops, according to a plate in the pilot's cockpit, 190 h.p. at 1,550 to 1,600 r.p.m. The radiator is placed between the body and the lower plane. There is a shutter arrangement for varying the cooling. A water collector or tank is placed above the port row of cylinders. The exhaust gases are carried outwards to each side through short collectors. With the older motors the exhaust from both rows of cylinders was carried inwards to a common collector carrying it up above the top plane, an arrangement which greatly hampered the view of the pilot. In these machines the radiator was in the nose of the body. An auxiliary radiator was placed below the fuselage.



The motor is bolted to two channel section steel bearers, which rest on strong sheet steel cradles. Immediately behind the engine is placed transversely the oil tank, which has a capacity of 7 litres. The main petrol tank, which has a capacity of 170 litres, is divided into three compartments, and is placed behind the pilot's seat. From here the petrol is pumped into a small gravity tank holding 12 litres and placed behind the engine. For this is employed either a pump driven by the engine or a hand pump to the right of the pilot. If too much petrol is pumped through it is returned to the main tank via an overflow.

The pilot sits in a line with the leading edge of the top plane. Here he has a very good view forward, but the view in a rearward and upward direction is very restricted.



On the instrument board in front of the pilot are the following instruments: A cooling water thermometer, ignition control, compass, petrol cock and revolutions indicator. To the right, at the side of the seat, is the petrol hand pump elevator. On the left are the levers for advancing or retarding the ignition, the petrol and air levers, the radiator shutter control, and the oil cock. In the floor of the fuselage, in front of the rudder bar, there are small windows.

In the observer's cockpit there are two folding seats, one in front and one at the rear. In front, behind the petrol tank, there are on each side racks for four bombs. Between these racks, through an opening in the floor, the protographic camera can be inserted. A shelf for plate holders is placed behind the port bomb racks. On the starboard inner wall of the observer's seat are aluminum plates for the switches and keys of the wireless. The other instruments of the wireless are placed aft of the seat.

The pilot is armed with a fixed machine gun placed on the right-hand side above the body, and is operated from the left cam shaft. Firing is accomplished by Bowden control from the control wheel. The observer has two movable machine guns, couples together and mounted on a gun ring with elevating arrangements.

PROBLEMS OF CRANKSHAFT DESIGN*

By OTTO M. BURKHARDT[1], Buffalo, N. Y.

GASOLINE engines, of the kind at present produced in large quantities for aeroplanes and motor vehicles, may turn over at 3000 r.p.m. or faster. The forces necessary to induce and maintain these speeds, as well as other forces closely associated with high speeds, are numerous; but with a particular object in mind,

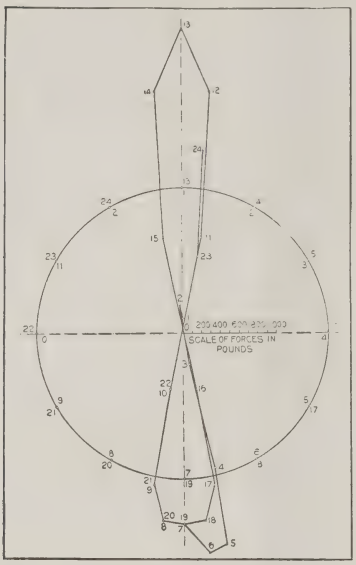

Fig. 1. Centrifugal forces and combined gas and inertia forces acting on crankpin of six-cylinder engine.

this paper will be confined to the three most important groups of forces—the pressures due to the gaseous mixture, the inertia forces, and the centrifugal forces. The smooth running and the life of an engine depend mainly on these three factors.

The reciprocating masses linked to the crankshaft will be considered as one mass concentrated at one point in the axis of the cylinder. This simplification implies that the inertia forces are, like the gas pressures, acting primarily in the direction of the cylnder axis, a condition that permits arithmetical addition of both groups of forces. To the same category belongs another group of forces which, according to a well-known law, has its origin in the angularity of the connecting rod. The different component forces have been determined in respect to two engines of equal capacity for 24 crank positions. These positions are uniformly spaced at intervals of 30 deg. and comprise two revolutions, which constitute one complete cycle in case of four-stroke-cycle engines.

Corresponding components when combined as resultant forces and graphically represented in magnitude and direction, yield irregular characteristic diagrams with which every engine designer should acquaint himself.

As subjects for investigation, medium-size six- and twelve-cylinder engines, both of the same cylinder volume, were chosen. Both engines are supposed to be similar in design and up to the same standard of construction. Some particulars relating to these engines are given in Table 1.

Table 1. Dimensions and Weights for Engines of Similar Design

	Six-Cylinder	Twelve-Cylinder
Cylinder bore, in.	3.75	3.00
Stroke, in. (= bore × 1.667)	6.25	5.00
Weight of reciprocating parts, lb. (1 cylinder)	4.07	2.60
Weight of rotating parts, lb. (1 cylinder)	2.40	1.93
Weight of rotating parts, lb. (2 cylinders)	....	3.86

Fig. 1 is a force diagram pertaining to the six-cylinder engine. The concentric circle is a graphical representation of the centrifugal forces acting on the crankpin at a speed of 2700 r.p.m. The combined gas and inertia forces as above referred to are represented by the irregular polygons.

For instance, O-3 of this diagram represents the magnitude and direction of the combined gas and inertia forces if the crankpin is in position 3, that is, 60 deg. from the top dead center. For one complete cycle the different strokes are represented as follows:

Power stroke, by forces O-1 to O-7
Exhaust stroke, by O-7 to O-13
Suction stroke, by O-13 to O-19
Compression stroke, by O-19 to O-1.

To obtain a clear picture of the total forces acting on a crankpin, we must combine both diagrams as follows: O-1 of the polygon with O-1 of the concentric-circle diagram, and so on. This yields the diagram shown in Fig. 2, which represents the magnitude and direction of the resultant forces acting on the crankpin of a six-cylinder vertical engine.

The combined gas and inertia forces for one unit of a twelve-cylinder engine and the corresponding centrifugal forces are diagrammatically represented in Fig. 3. We observe that these

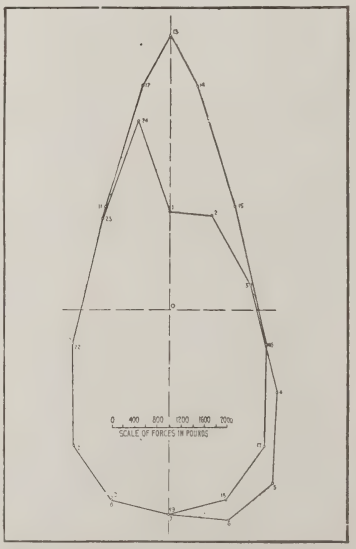

Fig. 2. Combined centrifugal, gas and inertia forces acting on crankpin of six-cylinder engine.

forces are much smaller but quite analogous to those given in Fig. 1. The combination of the gas and inertia forces with the centrifugal forces yields the diagram shown in Fig. 4, which represents in magnitude and direction the resultant forces per cylinder acting on the crankpin of a twelve-cylinder engine. It must be borne in mind, however, that in the case of the engine under consideration, two single-cylinder engines are acting on one crankpin. We have, therefore, to superimpose two diagrams so that their vertical axes include an angle of 60 deg., as in Fig. 5. The crank positions 1 to 24 in the dia-

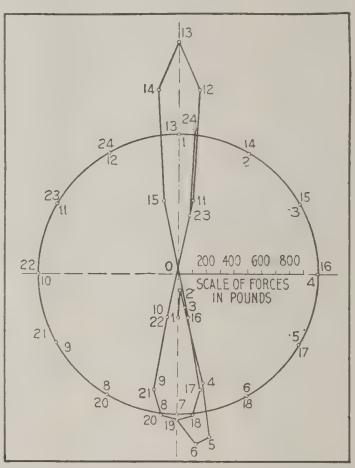

Fig. 3. Centrifugal forces and combined gas and inertia forces due to one cylinder acting on crankpin of twelve-cylinder engine.

gram are plotted according to the clockwise rotation of the crankshaft. The distinction between the right- and left-hand block of cylinders is made through the indices *R* and *L* by similarly viewing the engine. According to the conventional sequence of firing, we obtain: 1L, 6R, 5L, 2R, 3L, 4R, 6L, 1R, 2L, 5R, 4L, 3R. From this we see that the engine on the right is in phase 420 deg. behind the other, or (what amounts to the same thing) 300 deg. ahead of it. It follows that we must combine force O-1L due to the left-hand engine with force O-11R due to the right-hand engine and so on. Properly carried out for all simultaneous acting forces, this yields a diagram, Fig. 6, representing in magnitude and direction the forces acting on the crankpin of a twelve-cylinder V-type engine.

It is difficult to neutralize by balance weights the effect on the crankpin of the forces shown in Figs. 2 and 6. The reason is that the centrifugal forces involved are due to a mass performing a relative motion. That is to say, the rotating mass of the connecting rod does not rotate truly about its own center but turns relatively to another mass, which turns about a center of its own.

In order to be entirely effective under such circumstances, balance weights would in turn have to perform relative motions. This introduces extra friction and complication. Balance weights for this effect are quite feasible, however, for six-cylinder engines, but they are almost an impossibility for twelves. The diagrams reveal the fact that the forces are smallest in a horizontal direction. This suggests that the oil holes in the crankpin should be placed at right angles to the radial lines through the center of the pin. The preferable direction would be opposite to that of rotation. To prevent the oil from escaping, a labyrinth should be cut in the bushing bearing surface, where the forces are a minimum.

A glance at Figs. 2 and 6 shows that the difference in the loads acting on the crankpin of either engine is not marked. The maximum load in the case of the twelve is 4040 lb., and in the case of the six, 4795 lb. The difference between the two is 18¾ per cent of the former. These loads increase approximately as the square of the speed. If then the twelve-cylinder engine runs at 2940 r.p.m., it is subject to the same maximum load as is the six when running at 2700 r.p.m. Mention is made of this because it is generally found in practice that a car with a twelve-cylinder engine is geared so that the

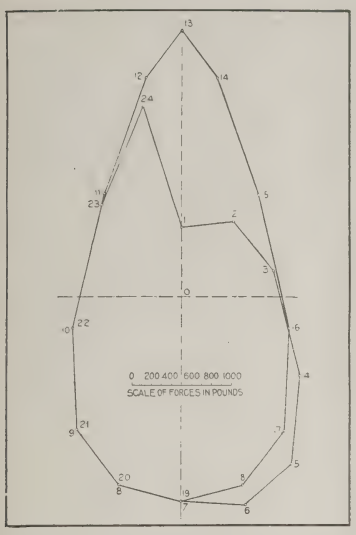

Fig. 4. Combined centrifugal, gas and inertia forces due to one cylinder acting on crankpin of twelve-cylinder engine.

engine runs at a slightly higher speed than a six-cylinder would be made to run.

The life of a crankshaft bearing depends largely on the magnitude of the mean pressure resulting from the various loads acting during one complete cycle, and this has been found to be 15 per cent smaller with the six than with the twelve. It is an axiom in bearing design that a certain permissible load per unit of bearing surface should not be exceeded. Nevertheless we shall not content ourselves with speaking of maximum or mean loads exclusively, a mistake which is committed by altogether too many engineers who endeavor to design high-speed-engine bearings with a certain specific load as their only guide.

Designers also should not lose sight of the fact that intermittent loads such as are encountered in high-speed internal-combustion engines affect bearings differently than does a steady load. It is well understood that a load acting continually in one direction is likely to cause lubrication difficulties. To what extent a bearing will behave well under the effect of a steady load is shown by an experiment[1] made by Professor Goodman, who states that he has had a journal running for weeks with a surface velocity of 4 ft. per sec. under a steady load of 2 tons (4480 lb.) per sq. in., the journal being kept at a temperature of 110 deg. Fahr. by a stream of water forced thorugh it. It is evident that bearing loads of this magnitude are hardly permissible under conditions where the load is subject to frequent and abrupt changes in direction unless an unusual amount of attention is being given to the maintenance of a certain running clearance by frequent adjustments. Therefore it is advisable under ordinary circumstances either to avoid fluctuations in load or to reduce the specific bearing pressure. For instance, the maximum permissible load on crankpins of slow-running stationary gas engines and locomotives is about 1500 lb. per sq. in. of bearing surface.

Furthermore, it is essential for an engineer to bear in mind the well-known fundamental empirical law of fluid motion, namely, that the resistance to sliding is due to the shearing of the fluid film and is consequently a function of the velocity of shearing, the viscosity of the fluid, and the shearing area. This law has proved useful for solving lubrication problems and conforms with the well-known experiments by Beauchamp Tower[2] which showed that the frictional resistance of a journal at a constant temperature is directly proportional to the square root of the rubbing velocity and is independent of the total load.

The laws of friction and carrying power thus far mentioned assume the presence of an oil film of not less than a certain thickness between the journal and the bearing. Without this film no bearing can be safe against undue abrasion. To maintain this much-desired oil film the designer should as far as possible protect bearings from unequal pressure distribution, from abrupt changes in the direction of these pressures, and from an undue rise in temperature.

The pressure distribution, which in most cases is more or less imperfect, depends on the design of the crankshaft, and will be discussed more in particular later. The character of pressures can be determined by means of diagrams. From these diagrams we may derive the mean bearing pressure, which, when multiplied by the circumferential velocity of the journal and the coefficient of friction, represents the work expended in friction.

The rise in temperature may be expressed as a function of the work expended in friction, if we limit ourselves to conditions under which the radiating surface of the bearing and the feed of oil are the same.

The frictional work per square inch of bearing surface is mathematically expressed by:

$$w = \mu \frac{P}{dL} \times \frac{d\pi N}{12 \times 60} = \mu p v \qquad [1]$$

where

w = work expended in friction per sec. and per sq. in. of bearing surface
μ = coefficient of friction
P = total bearing load, lb.
p = specific bearing load, lb. per sq. in.
d = diameter of shaft, in.
L = length of bearing, in.
N = speed of shaft, rev. per min.
v = circumferential velocity of shaft, ft. per sec.

From [1] it follows that

$$pv = \frac{PN}{229L} \qquad [2]$$

According to data gathered from well-performing and durable engines it may be stated that the value pv should not exceed 17,000 ft.-lb. per sec. This value is far in excess of other similar values. Güldner states that in case of stationary based on experience is about 1500 ft.-lb. per sec. for bearings lined with white metal. From this gas engines the maximum limiting value of pv it is evident that a value of 17,000 ft.-lb. per sec. is permissible only in cases where forced lubrication is used.

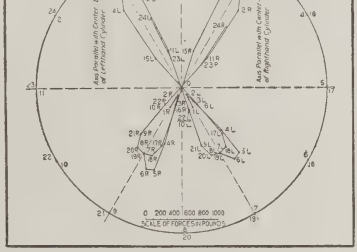

Fig. 5. Centrifugal forces and combined gas and inertia forces due to two cylinders acting on crankpin of twelve-cylinder engine.

In this connection it might be suggested that determination of pv values for various lubricating systems would be very desirable.

To apply this pressure-velocity criterion to the two engines under consideration it is necessary to determine the mean pressure of a complete cycle from Figs. 2 and 4. These are 2870 and 1650 lb. for the six and twelve, respectively. Assuming a crankpin diameter of 2⅛ in. for either engine, we obtain, at 2700 r.p.m., a rubbing velocity of

$$V = \frac{2\frac{1}{8} \times \pi \times 2700}{60 \times 12} = 25.02 \text{ ft. per sec.}$$

With a crankpin length of 2 in. we obtain, in the case of the six,

$$pv = \frac{2870 \times 2700}{229 \times 2} = 16{,}900 \text{ ft.-lb. per sec.}$$

With a crankpin length of 1 5/32 in. we obtain, in the case of the twelve,

$$pv = \frac{1650 \times 2700}{229 \times 1\,5/32} = 16{,}825 \text{ ft.-lb. per sec.}$$

The total crankpin length of the twelve, if the connecting rods are arranged side by side, should therefore be 2 5/16 in. This is about 15 per cent more than the corresponding length of the six. With equal crankpin diameters for both engines, the crankpin lengths must be proportional to the load. In order to verify this the mean total load acting on the crankpin of a twelve has been determined from the diagram in Fig. 6. As expected, it is 3300 lb., or 15 per cent more than the total load acting on the crankpin of the six.

This and all further comparisons between the six- and twelve-cylinder engines are based on the assumption that both engines are running at the same speed. But, as has been emphasized before, it is general practice to run a twelve-cylinder engine somewhat faster than a six. If this were taken into consideration, the difference between both engines would of course be more pronounced.

Before accepting the crankpin lengths given above as representing the final values, we will ease our minds with regard to the magnitude of the specific bearing pressure. In the case of the six we have a maximum load of 4795 lb. The projected bearing area of a crankpin 2⅛ in. in diameter and 2 in. long is 4¼ sq. in. This gives a specific pressure of 1125 lb.

In the case of the twelve we have a maximum load for each cylinder (taken from Fig. 4) of 2660 lb. and a projected bearing area of 2⅛ × 1 5/32 = 2.46 sq. in. If the engines are to be used for automobile propulsion, then it may be borne in mind that maximum speed is generally not maintained for any great length of time. The loads above given would represent, then, the exception and not the rule.

Automobile engines, however, are frequently subject to hard usage when long hills are climbed on high gear. Under such conditions the explosive pressures alone determine the loads on the bearings, because the speed of the engine is generally so low that the inertia and centrifugal forces are negligible. Assuming an explosion pressure of 380 lb. per sq. in. for both engines, we obtain total explosive loads of 4200 and 2690 lb. for the six and the twelve, respectively. In the first case we obtain a specific crankpin pressure of 4200/4.25 = 990 lb., while in the second we obtain 2690/2.46 = 1095 lb. The difference between both engines is here 10.6 per cent in favor of the six. The loads of the two engines due to explosive pressure alone are somewhat smaller than those obtained before at high engine speed.

All forces acting on the crankpin necessitate reactions on the main bearings. The total load on the main bearings also includes the centrifugal forces due to the crankpin and the adjacent crank cheeks. Theoretically, and now even practically, it is a simple matter to attach weights to the crankshaft that will relieve the main bearings on the centrifugal forces. Whether it is an advantage to do so will be presently investigated by means of diagrams.

The forces to be dealt with at first are those relating to the six-cylinder engine resolved into components in a manner as determined for a crankshaft of the seven-bearing type.

We are now concerned with two groups of diagrams:

a Main-bearing load for a crankshaft without balance weights: Fig. 7, loads on main bearings I and VII (counting from front of engine); Fig. 8, loads on II, III, V and VI; and Fig. 9, load on IV.

b Main-bearing load for a crankshaft with balance weights: Fig. 10, loads on main bearings I and VII; Fig. 11, loads on II, III, V and VI; and Fig. 12, load on IV.

It is plainly evident from the scale of the diagrams that the balance weights act to reduce

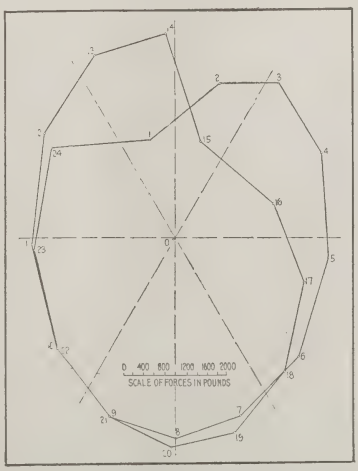

Fig. 6. Combined centrifugal, gas and inertia forces due to two cylinders acting on crankpin of twelve-cylinder engine.

[1] Unwin, Elements of Machine Design, part 1, p. 243.
[2] Proc. Inst. M. E., 1883 and 1884.

considerably the loads on the bearings, but, as already stated, magnitude is not the last word to be said about loads. Sudden fluctuations in the direction of the load are equally, if not more, detrimental to a bearing than the mere magnitude of the loads. Quick changes in the direction of a force acting on a mass are always accompanied by inertia effects. We must expect, therefore, that the journals carrying loads as shown in Figs. 10 to 12 will develop an undesired reciprocating or rocking action. Figs. 7 to 9, however, represent comparatively steady loads. The journals carrying these loads will creep around on the bearing surface, an action in principle like that involved when a planetary gear rolls within an internal gear. This facilitates lubrication, because the lubricant, while adhering to the metal surfaces, is continually wedged in between the two bounding surfaces. From this it is seen that beyond pounds of load per bearing there is, so far, nothing to say in favor of balance weights.

The length of the bearings necessary to carry the respective loads safely can be determined by the formula $pv = 17{,}000$ ft.-lb. per sec. With a main-bearing diameter of 2½ in. we obtain for 2700 r.p.m. of the engine a circumferential velocity of $v = 25.02$ ft. per sec. The mean loads on the bearings, as obtained from the diagrams, are given in Table 2, together with the necessary bearing lengths, the values of pv and the specific bearing pressures.

In the case of bearings I and VII a liberal amount should be added to the length of the bearing to take care of the loads due to the timing gears and the flywheel, and at least ¼ in. should be added to every bearing to allow for fillets. But in spite of this we find that the bearing lengths for the balanced type are entirely too short to hold the requisite oil pressure. If they are lengthened so that they are in conformity with *this* practical consideration we will obtain bearings for a crankshaft *with* balance weights about as long as those for a crankshaft *without* balance weights.

Apart from these analytical considerations it has now become an established fact that the smooth running, life and power of a well-designed engine with a seven-bearing shaft cannot be improved by the addition of balance weights. This is true in spite of the fact that any shaft with balance weights will perform much better on any balancing machine than will its prototype without balance weights. This paradoxical result is easily explained if we bear in mind that a shaft when running in a balancing machine is not subject to the sudden impulses which are a necessary evil inherent to the reciprocating engine. It seems that the best method

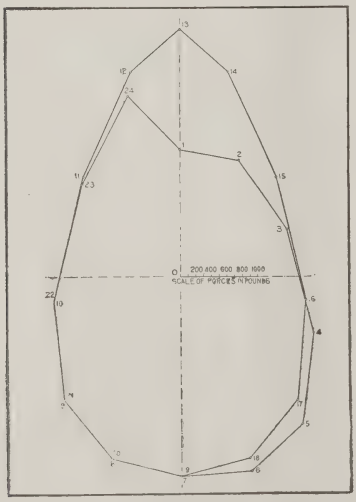

Fig. 7. Loads on main bearings Nos. I and VII of crankshaft without balance weights.

to make these impulses harmless is to smooth them out by means of the centrifugal forces, which, as we know, are available "free of charge."

It remains now to determine the loads on the main bearings for the twelve-cylinder engine in a manner similar to that which was adhered to in the case of the six. However, since there is not the slightest difference in the procedure, it is permissible to draw conclusions from former results. We must therefore reconcile ourselves with the fact that in all cases the mean pressure of a complete cycle will be about 15 per cent in excess of the corresponding pressures represented in Figs. 7 to 12. This conclusion is based on the results derived from the force diagrams shown in Figs. 2, 4 and 6. These diagrams show that the mean pressure on the crankpin of a twelve-cylinder engine is 15 per cent larger than that on the crankpin of a six.

In the case of a twelve with two connecting rods mounted side by side on one crankpin the distribution of load over the whole length of the crankpin is not uniform, because the loads on the two connecting rods do not at every instant act with equal intensity. The point of application of the resulting loads given in Fig. 6 is

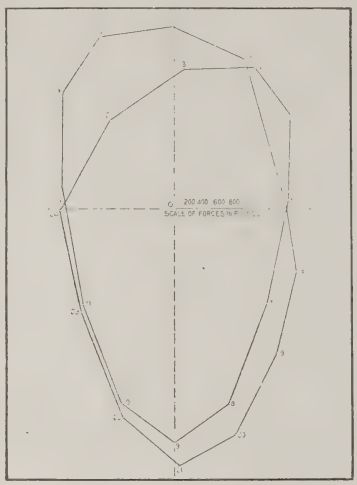

Fig. 8. Loads on main bearings II, III, V and VI of crankshaft without balance weights.

therefore not in the middle of the crankpin, as is the case with the loads given in Fig. 2. The two main bearings adjacent to the crankpin (seven-bearing crankshaft) will not receive at every instant exactly half the loads given in Fig. 6, but alternately the one will receive somewhat more and the other somewhat less than half of the total for well-known mechanical reasons.

This rough-and-ready analysis, however, permits the conclusion that the main bearings of a twelve-cylinder engine should be designed to give at least 15 per cent more bearing surface than main bearings which have proved successful for a six-cylinder engine of equal capacity.

In the preceding discussion we have been dealing with various dimensions for crankpins and main bearings. These dimensions were

Table 2. Data for Balanced and Unbalanced Crankshafts

Bearing number	Type of Crankshaft	Mean load	Theoretical bearing length	Value of pv	Mean specific bearing pressure
I, VII	Balanced	774	1⅛	16,200	648
	Unbalanced	2180	1⅝	16,425	657
II, III,	Balanced	839	⅞	15,800	633
V, VI	Unbalanced	2190	1⅛	16,500	660
IV	Balanced	1520	1⅛	16,725	670
	Unbalanced	4350	3	17,040	682

chosen according to the dictation of sound engineering. While this method is satisfactory, it is well to verify the results obtained, perhaps in the following manner. Both engines so far spoken about will develop probably a maximum torque of about 3000 in.-lb. This would correspond to about 48 h.p. at 1000 r.p.m. However, the torque on the crankshaft is subject to considerable fluctuation, depending on the number of impulses. This fluctuation, which, of course, has some bearing on the operating smoothness of an engine, was made the subject of many investigations in the early days of the six, and again at the advent of the eight and the twelve. Such investigations have revealed that the multi-cylinder engine, six, eight, twelve, etc., certainly deserves great credit for its smooth torque.

Owing to the small number of impulses, the torque on the crankpin of a six-cylinder engine may at intervals be two and a half times as large as the torque indicated on the dynamometer. In considering the strength of the crankshaft we must therefore deal with a torque of, say, 7500 in.-lb. With a crank radius of 3⅛ in. this torque results in a tangential force of 2400 lb., acting through the crank cheek on the crankpin as indicated in Fig. 13.

If we at first assume the crank cheeks as being infinitely strong, we can consider the crankpin as a cantilever. With a crankpin length of 2 in., plus half the width of the cheek, the total length of the cantilever will be about 2½ in. The bending moment is, consequently, $2400 \times 2\frac{1}{2} = 6000$ in.-lb. The moment of resistance to bending of a 2⅛-in. diameter cylinder with a 1-in. hole is 0.896 in.^{3} With an elastic limit of 110,000 lb. per sq. in. (chrome-nickel steel) we obtain from these data 16.4 as the factor of safety. Crankpins are further subject to some shearing and bending due to the load acting directly on them, but in the above calculation this has not been taken into consideration. If we allow for these extra stresses we may obtain a final factor of safety of 12, which is not too much for so important a part as a crankshaft.

After this we may now assume the crankpin to be infinitely strong. From this point of view we must expect the crank cheeks to deflect in a manner as shown in Fig. 13. The twisting moment to be resisted by the cheeks evidently is $2400 \times 3 = 7200$ in.-lb. The moment of resistance to torsion of a rectangular section is $2b^2h/9$. The permissible fiber stress in case of twist is about 75 per cent of that permissible for bending. Taking this into consideration, and maintaining a factor of safety of 12, gives the following equation:

$$7200 = 2 \times \frac{0.75 \times 110{,}000}{12} \times \frac{2}{9} b^2h$$

From this, taking $h = 2\frac{3}{4}$ in., we obtain the thickness of the cheek b as 0.925 in.; or, to give an even figure, 15/16 in. This small special allowance is desirable because the crank cheeks, like the crankpins, are subject to compound stresses.

In this connection it may be remarked that, as a rule, the crank cheeks are found to be the weakest parts. Fig. 13 and the calculations explain why so many shafts break along the lines marked *A B C*.

In the case of the twelve-cylinder engine the maximum torque on the crankpin will be only about 50 per cent more than that indicated on the dynamometer. We shall therefore have to deal with a torque of about 4500 in.-lb. With a crank radius of 2½ in. we derive from this torque a tangential force of 1800 lb. acting through the crank cheeks on the crankpin. With a crankpin length of 2 5/16 in., plus half the width of the cheek, we have a total length of 2¾ in. The bending moment on the crankpin is therefore $1800 \times 2\frac{3}{4} = 4950$ in.-lb. The factor of safety derived from this is 20. The twisting moment in the crank cheeks is $1800 \times 3\ 3/16 = 5740$ in.-lb.

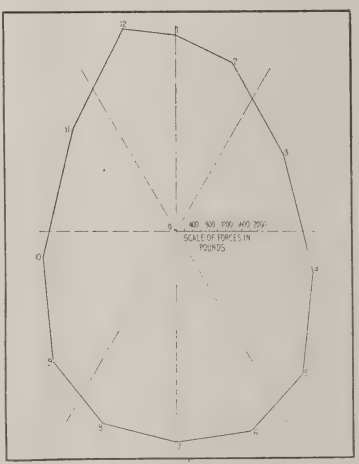

Fig. 9. Loads on main bearings IV of crankshaft without balance weights.

The thickness of the cheeks with a factor of safety of 12 we derive as before from the equation:

$$5740 = 2 \times \frac{0.75 \times 110{,}000}{12} \times \frac{2}{9} b^2h$$

From this we obtain a cheek thickness of 0.83 in., or, say, ⅞ in.

In order to compare a three- and seven-bearing shaft it must first of all be observed that the distance between the centers of the two main bearings is about two and a half times as much in the former shaft as in the latter. The tran-

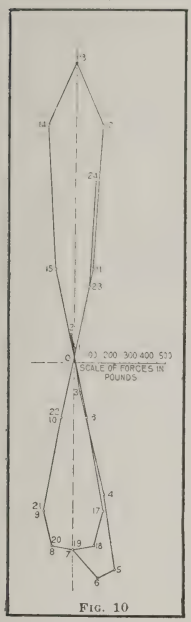

FIG. 10

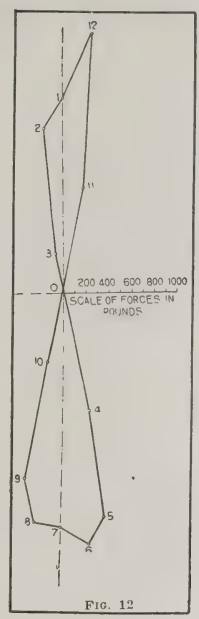

FIG. 12

Fig. 12. Loads on IV.

verse deflection of a straight shaft increases as the cube of the distance between the supports. It is evident, therefore, that if other conditions are the same, a three-bearing shaft will deflect up to $(2\frac{1}{2})^3$; that is, nearly sixteen times as much as a seven-bearing shaft.

It is hardly necessary to point out that excessive deflections are certainly not conducive to the operating smoothness of an engine. Not only that, but even the durability of the bearings is impaired, because a deflected shaft will not permit uniform pressure distribution in the bearing. Any eccentricity of the loading relatively to the middle of the bearing will create a tendency to drive out the oil at one end. This is the reason why bearings that swivel so as to accommodate themselves to any inclination of the journal on account of bending of the shaft are found to be of great advantage. However, as such bearings cannot be applied very well to crankshafts, it is advisable to design crankshafts so that their deflections approach a minimum.

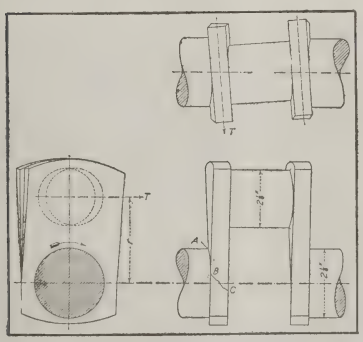

Fig. 13. Part of crankshaft illustrating deflection of crank-cheeks.

The deflection of a shaft varies inversely as the moment of inertia of its weakest section. In order, then, to hold a three-bearing shaft within the same limit of transverse deflection as may be obtained with a seven-bearing shaft the crankpin diameters of both shafts must be proportioned in the relation of $\sqrt[4]{16}$ to 1, which is as 2 to 1. This necessitates a crankpin diameter of 4¼ in. for a three-bearing shaft designed to conform to our premises. For so small an engine as here under consideration this diameter is, of course, prohibitive. At the same time, it is almost prohibitive to use a seven-bearing shaft for a twelve-cylinder automobile engine on account of the excessive length. The only alternative left for the designer of such engines is to sacrifice rigidity.

The torsional deflection of a crankshaft is directly proportional to the torque moment. In a seven-bearing crankshaft a torque moment of the magnitude $M = T \times r$ occurs in the main bearings only. This torque is determined by the tangential force T acting on the crankpin and by the crank radius r, which is one-half the stroke of the engine.

In a three-bearing crankshaft a similar but more intense torque occurs, not only in the main bearings but also in the crankpin, as illustrated in Fig. 14. The momentum of the torque in this case is determined by T and by the shortest distance between T and the center of the twisted crankpin, which is denoted by R. From Fig. 15 we find that $R = r + r \sin 30°$ or $R = 1.5\ r$. Consequently, in this case, $M = T \times 1.5\ r$. This permits us to draw the conclusion that the torque moments or torsional deflections of a three- and a seven-bearing crankshaft stand to each other in the relation of 1.5 to 1. It must further be mentioned that the twist in a crankpin is a more serious matter than the twist in the main bearings. We must consider that the only way to reduce the vibrations set up by a twist in a crankpin is by an increase in its diameter. The deflections in the main bearings may, however, be minimized by vibration dampers.

The same line of reasoning which we have established in connection with the three-bearing shaft must be followed in investigating a four-bearing, six-throw shaft. The distance between two bearings is about 1.75 times as great as in the case of a seven-bearing shaft, and consequently the transverse deflection is about five times larger. With regard to the torque in the crankpins, the same figures as before established apply, except that in this case a smaller number of crankpins are subject to twist.

As excessive transverse deflections must be detrimental to the bearings as well as to the operating smoothness of the engine, it is quite reasonable to expect that balance weights will be an advantage for the latter two types of crankshafts, which are inherently weak. Seven-bearing crankshafts, when well designed, are inherently strong enough so that they cannot be improved through the addition of balance weights. We can predict, therefore, that the use of balance weights will be limited to shafts with a smaller number of bearings than would be desirable from the viewpoint of strength. Balance weights are like the flywheel the symbol of some imperfection. If we compare shafts of equal strength we will further find that the weight of a three- or four-bearing, six-throw crankshaft that is properly balanced will by no means be less than that of a seven-bearing shaft.

The total piston displacements of different engines designed with a constant stroke-bore ratio are proportional to the cube of the cylinder bore. For instance, if the bore of an engine is b, and its stroke is $1.667b$, the piston displacement of this engine per cylinder is $(b^3\pi/4) \times 1.667b = 1.309b^3$.

The explosive impulses of different engines are proportional to the square of the cylinder bore, providing that the same compression is used throughout. Denoting the bore of a six-cylinder engine with b_6 and that of a twelve-cylinder engine with b_{12}, we find for two engines of equal total piston displacement the following relation:

$$6 \times 1.309 \times b^3_6 = 12 \times 1.309 \times b^3_{12}$$

From this it follows that

$$b_6 = \sqrt[3]{2} \times b_{12} \qquad [3]$$

The explosive impulse E of an engine is proportional to the square of the cylinder bore. between the explosive impulses of a six- and twelve-cylinder engine the following relation therefore exists:

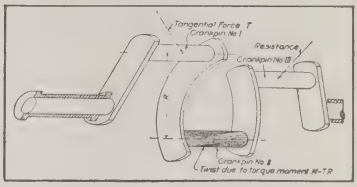

Fig. 14. Part of crankshaft illustrating torque in crankpin in case of three- and four-bearing six-throw crankshafts.

$$\frac{E_6}{E_{12}} = \frac{b^2_6}{b^2_{12}}$$

When substituting for b_6 the value given in [3], we obtain

$$\frac{E_6}{E_{12}} = \frac{(\sqrt[3]{2})^2 \times b^2}{b^2_{12}} = \frac{(\sqrt[3]{2})^2}{1}$$

In practice we invariably find that the small-bore engine is working under somewhat higher compression. This results in a higher explosive force per unit of piston area. To give an example, we may assume, for the two types of engines to be compared, that the large-bore, six-cylinder engine may work with a compression pressure of 85 lb. per sq. in., and the small-bore twelve-cylinder engine with one of 90 lb. per sq. in. Substituting this in the above given relation, we obtain

$$\frac{E_6}{E_{12}} = \frac{85}{90} \times \frac{(\sqrt[3]{2})^2}{1} = 1.5 \text{ to } 1$$

From this we learn that for a certain standard of engineering the explosive impulse of a six-cylinder engine is about 1.5 times as large as that of a twelve-cylinder engine of equal total piston displacement.

In conclusion, a few words may be said about lubrication, although this can be considered a problem all by itself. To obtain absolutely satisfactory conditions, the oil delivery to the bearings must be in direct proportion to the work converted into heat by the bearings. We should

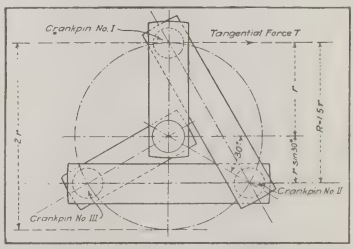

Fig. 15. Part of crankshaft showing maximum leverage in case of three- and four-bearing six-throw crankshafts.

lay out a series of diagrams, as previously discussed, for different engine speeds and for different power outputs. The values of pv obtained from the various diagrams would give us a clear picture of how the oil delivery should be regulated. Scientific oiling would eliminate scraper rings, and thus permit lighter pistons. It would also eliminate sooted spark plugs, carbonization, preignition, and would permit higher compression.

SOME OF THE AMERICAN DE HAVILAND PLAN

IN a despatch to the *New York Evening Sun*, Thomas M. Johnson, their special correspondent, describes the recent mammoth Allied air drive, in which a large number of American machines participated, as follows:

"The American air service dealt the Boche one of the heaviest blows of the entire war October 19 in a gigantic bombing expedition in which 142 aeroplanes swooped down upon railroad depots and junctions behind the German lines, dropping many tons of bombs and firing thousands of rounds from their machine guns, spreading death and confusion.

"Among them were many Liberty planes which again proved their worth. One single American plane was lost and nine Germans were brought down.

"Some fast scout planes reported that the village of Bayonville, at the junction point of six roads southeast of Buzancy, was jammed with German traffic and troops pouring in from the converging roads.

"'There's our meat!' said the bombers.

"Soon there was a great buzz of activity around the aerodromes and then the throb of motors, as one by one the machines of the great fleet took flight and circled about for a short time, testing motors and assembling. It then formed an arrowhead formation and sped for the German lines.

"It was just at 3:30 o'clock, the time set, when the planes arrived over Bayonville. One look was enough to show that the scout told the truth. The village was fairly seething with German soldiers, wagons and trucks.

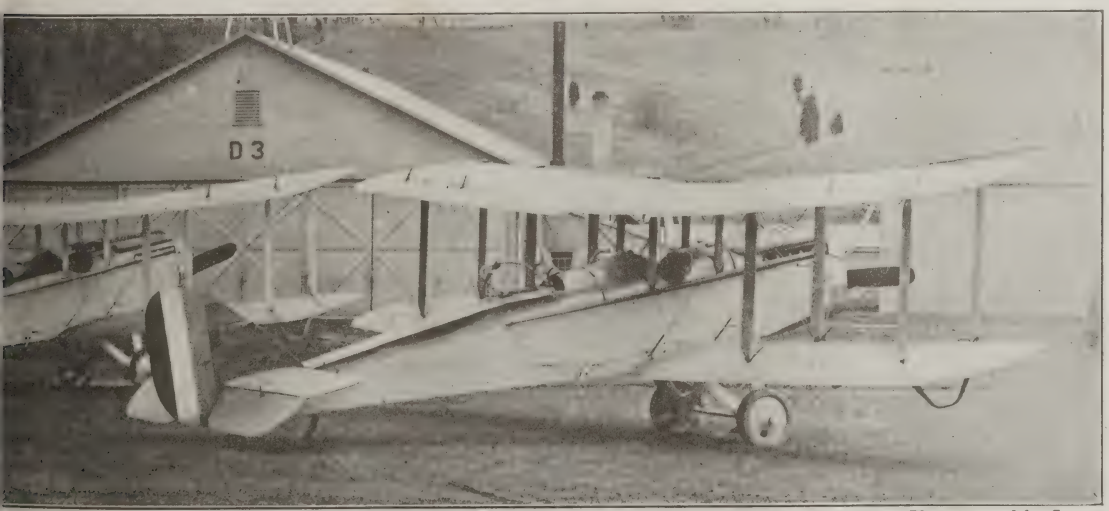
"The men were floundering through the mud and all converging roads were jammed. For the moment Bayonville was a veritable 'Forty-Second street and Fifth Avenue.'

"The first to come upon the scene were

De Haviland Planes produced by the Dayton Company,

THE RECENT MAMMOTH ALLIED AIR DRIVE

two squadrons of low-flying planes that skimmed along from twenty-five to eighty yards above the ground. They saw the white dots of terror-stricken German faces upturned and saw the men afoot, running, as the drivers had jumped from the trucks and wagons.



"Then some launched small light bombs that burst the instant they struck, scattering myriads of steel fragments. Others flew back and forth along the swarming roads, scourging the enemy with machine gun bullets as the confusion became greater.

"The second layer of American aeroplanes arrived, flying a little higher and armed with small and large bombs, which were dropped in their turn. They were specializing on the roads just outside the village, where the Germans were trying to escape from the wrath on high.

"Hardly had the last red flash arisen to mark the fall of their bombs when with a mighty drumming, as of the wings of a plague of a million locusts, came the heavy bombers in Liberty planes. They had been flying as high as 4,000 yards, bearing the most terrible weapons of all—monster bombs that reduce a solid stone house to a heap of rubbish and dust or blast a crater in a road twenty feet across.

"They came down lower and the airmen deliverately chose their targets, such as the main cross roads and the centre of the town bridge over the Agron on the western edge of the town. As they pulled the levers the bombs sped downward with a wicked, whistling, rushing sound into the crazed and roaring streets of Bayonville.

"In a few minutes the fast scout planes that had flown above the heavy bombers to protect them swooped down to see the results and beheld a terrible sight. Bayonville was in flames and clouds of smoke were seen along the roads, which were filled with wrecked wagons, dead horses and the bodies of gray clad men."

aking efforts to deliver 4,000 planes by Christmas

Photos passed by Censor.

ARTILLERY OBSERVATION

ARTILLERY observation from the air, at the beginning of the war somewhat haphazard, has become one of its most scientific branches, and at the present time no shoots are conducted by big guns without the co-operation of aeroplanes. Indeed, in a shoot aimed at the destruction of an enemy battery, machine gun emplacement, or concentration of troops or ammunition, the battery of heavy artillery is absolutely under the command of the aeroplane which is doing the observing. A "shoot" may be described as a period of fire of a battery of heavy artillery. As there are various kinds of shoots, it will be well to describe the various types of guns used for each. They are as follows:

Guns

1—13 and 18 lb. guns, U. S. 3 in., and French 15 m.m; used for short barrage, breaking lines of communication, and breaking barb wire entanglements.

2—4.7 in. and 60 lb. field guns; used for "neutralization fire," long barrage, and breaking lines of communication.

3—6 in., 9.1 in. and 12 in. Used against villages, railway stations, etc.; employed at long range against observation towers. The 6-inch gun is used also for long range counter battery work.

Howitzers

4.5 in. Howitzer; bombards weaker defenses, enfilades, trenches, and shoots against badly entrenches troops. Used for long distance wire cutting. Also used for counter battery work against guns without head cover. (The trajectory of the howitzer is peculiar in that it goes up in a high arc, and falls almost perpendicularly. This perpendicular drop makes it very valuable for use against trenches as the corrections needed at the point of fire will be very slight.)

6 in. Howitzer; trench bombardment, counter battery, and entrenched troops often behind the first lines.

8 in and 9.2 in. Howitzer; counter battery work against guns with strong head cover, and destruction of strong defenses.

12 in. and 15 in. Howitzer; this, the strongest howitzer on the list, is used with great effect for counter battery work, and is employed for the destruction of the strongest of the enemy's defenses. The duties of a pilot observing for counter battery work are many and varied. He must locate enemy batteries, and report at once those seen active.. He must reconnoitre enemy battery positions, especially those roughly located, or reported from other sources, and must find exact position if possible. He must observe fire, if so ordered, on hostile batteries seen active. He must locate machine gun emplacements, new trenches, and hostile works generally. He must observe and record any movement of troops or supplies, and report them immediately to headquarters.

The work of the artillery observer is usually mapped out before his flight, and he is given a map of the position, and generally some photographs.

There are two main kinds of shoots; registration, and destruction. In the former the artillery officer is in command, and in the latter the observer is in command. The registration shoot, as the name implies, is simply to "draw a bead" on some enemy position, or battery, and then destroy it at some future time. the destruction shoot is continued until the enemy battery or position has been utterly destroyed. Single rounds are generally sufficient for the initial observation and the finding of the range by the aeroplane, but on cloudy days a salvo is fired, or time shrapnel is fired.

Wireless is the mode of communication from the aeroplane to the ground, and the artillery officers below generally respond by ground strips. The wireless, of course, is entirely in code, and must be changed constantly to prevent the enemy's reading the messages.

In co-operation between artillery and aeroplanes, there are two types of shoots,—the Prearranged, and the Impromptu. The majority of the shoots belong to the second classification. The following essentials constitute a prearranged shoot: the pilot knows the position and arc of fire of the particular battery for which he wishes to observe, and knows the exact location of the enemy battery on which he wishes to train the guns. Perhaps it will be well at this time to describe the method of locating enemy positions and the way shots are "spotted."

According to the importance of the sector, one or more squadrons of observation aeroplanes are assigned. Each sector of enemy territory is mapped out in the following manner: The sector is first divided into 24 squares, and lettered in capitals: each square is then subdivided into a number of squares,—36 for example, and numbered. Each numbered square is divided again, and given small letters. Each small numbered square is subdivided by the mean of co-ordinates 1 to 10, running vertically and horizontally. Thus, in the smallest of these squares, the number 4-5 would mean four co-ordinates down on the vertical side of the square, and five co-ordinates horizontally. Thus we might locate a German battery by the means of our pin point system somewhat like the following: H 23 n 4-5. We then would look at our map. We find the battery in large square H, subdivision 23, further subdivision n, and co-ordinates 4-5. Thus we have it located almost to the foot. Next we consider our target as the center of a series of radiating circles, each circle lettered a, b, c, and so on. We then considered that the numerals of the clock are superimposed on each radiating circle. Now if we say a shot has fallen on circle *a*, at 6 *o'clock*, (having first assigned the distances the circles measure from the center), we know just the distance the shot has fallen, and which way the gun must be moved to correct the error. This clock process is continued until the range is found exactly by the artillery, and then the aeroplane is ready to observe for another battery.

We described above the classification of a prearranged shoot. The impromptu shoot is as follows:

Impromptu Shoot, 1st Class. Pilot finds Enemy battery and knows which of his own batteries he wishes to train on it.

Impromptu Shoot, 2nd Class. Pilot finds enemy battery, ammunition train, etc., but does not have any particular battery of his own to train upon it, and must signal for it.

Having found an objective, which he thinks worthy of a shoot for registration or destruction, the pilot must call up his battery, observe the shots, and direct the fire, by means of a wireless code, which is answered from the ground usually by means of ground strips, or the shutter.

We will consider, for example, that our pilot has found an enemy battery firing, which has not been accurately spotted. We will consider that the signal used to cover the words "Enemy Battery firing in position at" consists of the letters *XYZ*. The pilot will send the following signal by wireless. "XYZ H 23 n 4-5." The artillery officer of the sector in reality has the following message: "There is a battery of enemy guns firing in large square H, subdivision 23, smaller square n, and co-ordinates 4-5. I am ready to observe for fire." The artillery officer takes his map of the sector and locates exactly the place which the pilot has named. He then puts out a strip of cloth on the ground, its certain shape conveying a message to the pilot overhead, who is watching the ground in the vicinity of that battery. He places, for instance, a triangle, which may mean "Guns ready in five minutes."

The pilot continues his flight, until another ground strip is put out, meaning "Guns ready to fire." He repeats the designation of the target, and then signals, by means of code, "FIRE," and the guns respond. Keeping his map in front of him, he gives his observation according to the clock, *B 8*. If the circles are spaced fifty yards apart beginning from the center, or pin point location, the artillery officer knows that his shot has fallen 100 yards from the target on figure eight of the clock, and makes his corrections accordingly. This process is continued until a succession of shots indicates that the range is found, when the pilot signals "O. K., go ahead," but makes only occasional corrections, if any at all.

Different signals are used for the various objectives or targets which may be found during an observation, such as an ammunition train, mechanical transports, column of troops, etc., and the pilot may call for the type of shell to be used against them. When, for instance, he is unable to spot the shot, he may call for time shrapnel, which bursts in air, and is easier to spot in certain conditions of light than concussion sheels.

A two-seater machine is always used for artillery observation. The observer sits in a seat giving him an unobstructed view (and arc of fire in case of attack), and sends his wireless messages from a trailing aerial. He makes his observation while going toward his target, and sends his message while returning toward his battery.

When "winning the war in the air" is spoken of, it is taken to mean by the well informed, that the war can be won when the Allies have aeroplanes in such superior numbers that they can observe for their own artillery fire without hindrance of the enemy, and at the same time prevent the enemy from observing for their own artillery. Napoleon once stated that "God is one the side with the heaviest artillery," and from the lessons learned from this war it is evident that an infantry attack without artillery preparation is useless. Artillery fire without proper aerial direction also is useless. The sudden attack and success of the British at Cambrai was turned almost into disastrous defeat because of the fact that artillery preparation had not been made, and once the position was won artillery backing was not forthcoming. Observation for artillery is the most important work of the aeroplane in the present war,—this can be stated without contradiction.

(*Continued from page 370*)

aeroplane mail shall be fully prepaid, with special aeroplane postage stamps, or with ordinary stamps. When the latter are used the mail should be endorsed, "By aeroplane."

Something May Be Expected

This is illuminating. It would not be surprising if the Americans were to develop the aerial postal service rather vigorously at a comparatively early date. So far there has been little said on the financial side of the proposition. It will not be long, however, before some of the geniuses of Wall Street propound some important scheme. But not before the war is ended, because new capital issues are regulated by the Government there just as stringently as, if not more so than, in this country.—*The Aeroplane.*

(*Continued from page 373*)

date selected, late in October, will give the pilot the advantage of a full moon, and weather conditions over the Southern States are expected to be ideal at this time of the year. The start will be made from San Diego at about 3 o'clock in the afternoon.

Hall-Scott aeroplane engines of the A-5a type, two of which are in the Loughead aircraft, were developed especially for the United States Navy. This company has perfected an earlier model, designed as the A-5, with which numerous altitude, distance, and endurance records for seaplanes were made up to the spring of 1917, when the Government authorities took over the Hall-Scott production for naval purposes. The A-5a engine is a six cylinder motor, developing 160 horse power at 1,350 revolutions per minute, and has a bore and stroke of 5¼ x 7 inches. It weighs 595 pounds, or 3.75 pounds per horse power. On the Loughead twin motored F-1-A, these Hall-Scott engines will swing a propeller eight feet, eight inches long. The motors have been shipped to the Hall-Scott factory at West Berkeley, California, for a thorough overhauling before the transcontinental flight is begun. Prior to the start from San Diego for Washington, D. C., a number of cross country flights from Santa Barbara to Los Angeles and a final flight along the coast to San Diego will be made by the Loughead aviators.

Non-Gran Personnel

Matthew C. Dittmann, vice-president and treasurer of the American Bronze Corporation, Berwyn, Pa., has been appointed general manager at a recent meeting of the board of directors. This action is in recognition of Mr. Dittmann's nine years' association with this organization.

E. G. Anderson, sales manager, has been appointed advertising manager.

C. H. Baker, formerly auditor of the Timken Roller Bearing Company, Canton, Ohio, has been appointed assistant to Mr. Dittmann in charge of the financial and accounting departments.

These changes were brought about by the recent appointment of John W. Watson, president of the American Bronze Corporation, to the duty of assistant chief of the Hispano-Suiza Section of the Bureau of Aircraft Production of New York.

Silk Required for War Uses

The large part that the silk industry of the country is playing in the prosecution of the war is outlined in the semi-annual report of the Silk Association of America.

After telling how the entire spun silk branch of the industry has practically been turned over to the Government for the production of silk noil cloth for use in munitions fabrics, and outlining the extent to which powder bags of silk cloth are used in the firing of modern artillery, Secretary Ramsey Peugnet of the association says:

"Another important employment of silk in warfare is for parachute flares with star shells attached, often of 100,000 candlepower. These devices have played an important part in the present war, as all who have followed events know. The parachutes are about sixteen feet in diameter and are composed of lightweight habitual silk. They are dropped from aeroplanes, and when the flares are lighted the entire battlefield is illuminated for several minutes at a time.

"Silk tubular powder bags, or ballistite rings, as they are also known, are used in controlling the direction of projectiles.

"Other uses are in small bags for carrying explosives in trench warfare, and silk for fuse disks. It is quite likely that silk will come to be used to a greater extent in aeroplanes, balloons and parachutes.

"Sewing silks are extensively used and it is to be especially noted that all uniforms in the navy are sewed with silk. Silk neckerchiefs, silk braids, banner silks, and silk hat-bands are, of course, required extensively, both in the army and navy."

Secretary Peugnet also points out that it is estimated that 65 to 70 per cent of the producing capacity of the looms and spindles throughout the silk producing centers of the country is at present employed. This in itself, he says, means considerable curtailment, but it should be observed that it has been brought about by economic conditions rather than by Government order.

Standard Aero Flies for Liberty Loan

To stimulate subscriptions to the Fourth Liberty Loan, which have been exceptionally affected by the Spanish influenza epidemic, the Standard Aero Corporation of this city conducted two Liberty Loan flights on October 16.

The well-known aviator, O. M. Bounds, with an assistant, flew one of the latest types of Standard machines over the Oranges and surrounding towns in New Jersey, during the middle of the day. He started from the Standard Aero Corporation field promptly at noon, and covered wide territory.

A second flight was commenced at five o'clock, and this time Aviator Bounds covered the territory surrounding Elizabeth.

The aeroplane was loaded before starting on both trips with large quantities of Liberty Loan literature which was dropped to the public, urging every effort towards an over-subscription to the Loan.

32 Foe Aeroplanes Fall to Our Guns

With the American Army in France.—Thirty-two enemy balloons and aeroplanes have been brought down by the American anti-aircraft cannon and machine guns since the beginning of the St. Mihiel offensive, according to figures just compiled. The guns which have achieved this result were distributed in the rear areas, at the front and with moving infantry units.

Eight German planes were accounted for on the morning of October 4 near Montfaucon by two sections of the anti-aircraft artillery alone.

Of the thirty-two German aircraft brought down, twenty were accounted for by machine guns and twelve by the heavier guns. The machine guns average one success in every 2,500 shots.

The latest American Ace is Lieut. William Erwin, who, though an observer and therefore not supposed to engage in fighting, has just downed his fifth German aeroplane. Lieut. Erwin was mentioned in army orders for his latest performance.

The lieutenant was on an observation trip with Lieut. Esterbrook, also cited, when he met an enemy plane and forced it to retire. A moment later he met three Germans over Varennes and forced them to retire. Then he ran into two more German machines directing infantry liaison, and finally a biplane over Sommerance. Lieut. Erwin wounded or killed the observer and Esterbrook closed with the plane. It was sent crashing down.

Returning to his observation mission, Lieut. Erwin carried it out successfully, but on his return met a single Halberstadt, which he drove into flight.

All five victories have been officially confirmed.

The First American Aviation Pursuit Squadron completed its 100th successive victory on October 10 with a "Boche strafing raid," which netted six machines. Of these, Lieut. Edward Rickenbacher, of Columbus, O., got two, bringing his official total to fifteen, with three more which probably will be confirmed soon.

Lieut. Hamilton Coolidge of Boston, Mass., and William Palmer of Bennettsville, S. C., downed one between them; Lieut. James A. Meissner of Brooklyn, Lieut. Ralph A. O'Neil of Nogales, Ariz., and Lieut. Waters, one among them; Lieut. Reed M. Chambers of Memphis, Tenn., and Lieut. Wilbert W. White of New York, one each.

THE FORCEFUL SUGGESTION OF "PLANE TALK"

FROM our spirited contemporary "Plane Talk" we excerpt the following choice bits.

WHEN SHIP 1000 ARRIVED—

AIR SERVICE, S. O. S. PRODUCTION AND MAINTENANCE DIVISION

The Dayton Wright Airplane Company and 6,000 Employees: The Good Old U. S. A.

Gentlemen: Number —— plane arrived at 4:50 this morning. Thirty minutes after it was uncrated on our assembly floor, the flag draped over the top and a hundred men standing around it thinking of home.

Assembly Crew No. 1 of the Night Force was disappointed because they were not permitted to stay overtime without breakfast and assemble the plane. They left the enclosed memorandum requesting that the job be saved for them for the next shift. It will be difficult to keep the day assembly crews off of it but we shall try. We "eat them up" now as fast as they arrive on the railroad siding and if you will give us the next thousand we will put everyone of them into the air before the end of September.

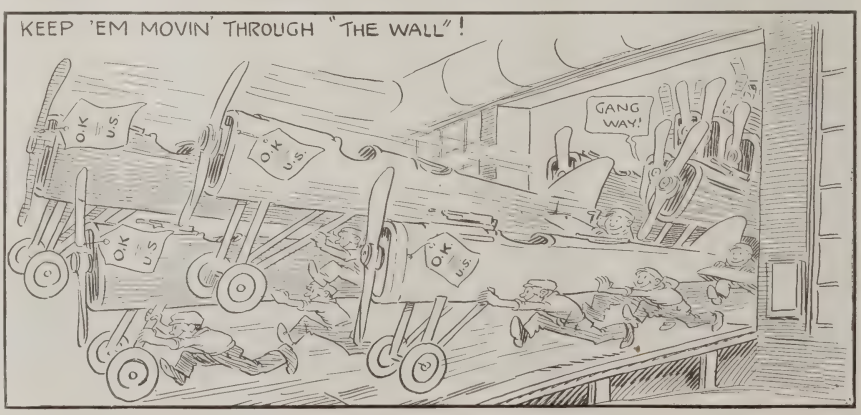
Personally this plane has brought many pleasant recollections. I am a Dayton man and I was with the N. C. R. when George Shroyer bought the millionth register and paraded with it through the streets. I wondered if No. —— had just such a trip, though of course if it did, it met with greater acclamation and enthusiasm.

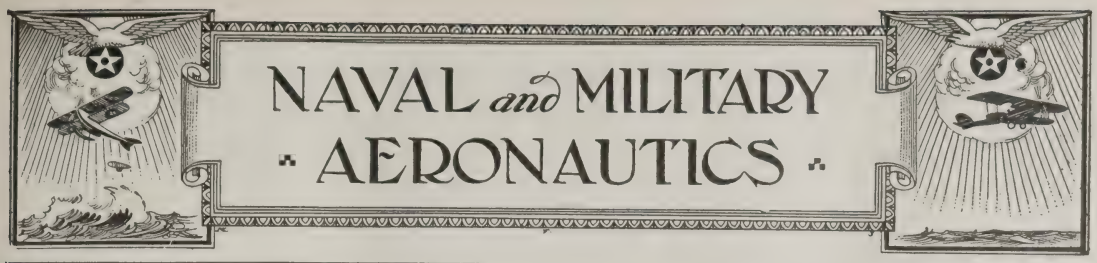
You will undoubtedly hear more from this ship after it has been assembled and flown but I could not resist sending you this first word of appreciation and thanks for the wonderfully good work you are turning ou tand sending to us. The Air Service has met with a lot of criticism but we are getting our stride now and soon the Hun will holler so loud it will be heard in Dayton.

More power to you all and my personal regards to all my friends "back there."

Cordially yours,
C. E. LLOYD,
1st Lieut., A.S.S.C.U.S.,
Asst. O.I.C., Assembly Plant 1-A.

LATER—Two of my Sergeants who found and turned in the cigarettes just came into the office and saw this letter on the desk. Sergt. Brown asked me to send his regards to "Magdalene" and Sergt. Chambers said, "Send mine to 'Maude' of the Final Assembly. I always did like that name." I do not know exactly what they meant, but I always do everything I can for the boys so here they are — the regards, not the boys. We need the boys till about next Summer when we will be on the way home.—C. E. LYOYD—*Plane Talk.*





A WORD FROM THE ENGINEERING DEPT.

On Decmeber 24, we are going to give Uncle Samuel as a Christmas present with best wishes from the employees of The Dayton Wright Airplane Company, the four thousandth battle plane manufactured by this company. The Engineering Department has done its work and it is now up to each and every one of us to "go to it." Follow the drawings closely and remember, No objections. They are the Kaiser's delights.

The Engineering Department has spent much pains and effort in producing the necessary drawings to enable us to proceed with our product. It may be interesting to note that the total number of drawings necessary for the De-Haviland Four machine amounts to approximately 3,000. Do you know what this means and represents? It means that it took our engineers anywhere from less than an hour to two weeks to make each of these drawings and represents just so much brain work, to say nothing of the midnight oil that was necessary for this accomplishment. Can you not see the necessity, therefore, in following the instructions and drawings issued from the Engineering Department in every detail in the performance of your work?

No, we don't claim to know it all and that is the very reason why we are asking your co-operation. If you have any suggestions or any constructive criticism to make, let's talk the thing over. It may be that you have the right idea, but for God's sake don't knock. Let's all work together and push this thing through.—J. M. SCHOONMAKER, JR.—*Plane Talk.*

AOV—Report to School for Aerial Observers, Hampton, Va.
APR—Report to School of Aerial Photography, Rochester, N. Y.
ARV—Report to Aviation Supply Depot, Richmond, Va.
ASM—Report to Aviation Mechanics' Training School, St. Paul, Minn.
BFT—Report to Barron Field, Fort Worth, Texas.
BRN—Report to Bakers Field, Rochester, N. Y.
BST—Report to Brooks Field, San Antonio, Tex.
CAF—Report to Carlstrom Field, Arcadia, Fla.
CAP—Commissioned as Captain, Aviation Section, Signal Corps.
CDT—Report to Aviation Concentration Camp, Dallas, Texas.
CFT—Report to Carruthers Field, Fort Worth, Texas.
CGC—Report to Aviation Concentration Camp, Garden City, L. I., N. Y.
CGS—Report to Aviation Concentration Camp, Greenville, S. C.
CIT—Report to Radio School, Carnegie Institute of Technology, Pittsburgh, Pa.
CJS—Report to Camp Jackson, Columbia, S. C.
CJW—Report to Camp John Wise, San Antonio, Texas.
CLR—Commissioned as Colonel, Aviation Section, Signal Reserve Corps.
CMV—Report to Aviation Concentration Camp, Morrison, Va.
CPA—Commissioned as Captain Air Service, National Army.
CPR—Commissioned as Captain, Aviation Section, Signal Reserve Corps.
CRI—Report to Chanute Field, Rantoul, Ill.
CSO—Report to the Chief Signal Officer, Washington, D. C.
CUI—Report to School of Military Aeronautics, Cornell University, Ithaca, N. Y.
CWT—Report to Call Field, Wichita Falls, Texas
DAF—Report to Dorr Field, Arcadia, Fla.
DAP—Report to Director of Aircraft Production, Washington, D. C.
DIK—Report to Camp Dick, Dallas, Tex.
DIS—Honorably discharged from service.
DMA—Report to Director of MilitaryAeronautics, Washington, D. C.
ELA—Report to Eberts Field, Loanoke, Ark.
EOT—Report to Ellington Field, Olcott, Texas.
FLA—Commissioned as First Lieutenant Air Service, National Army.
FLR—Commissioned as First Lieutenant, Aviation Section, Signal Reserve Corps.
FLT—Commissioned as First Lieutenant, Aviation Section, Signal Corps.
FOB—Report to Fort Omaha Balloon School, Omaha, Neb.
FRF—On duty requiring regular and frequent aerial flights.
FSO—Report to Fort Sill School for Aerial Observers, Fort Sill, Okla.
GIT—Report to School of Military Aeronautics, Georgia Institute of Technology, Augusta, Ga.
GLC—Report to Gerstner Field, Lake Charles, La.
HHN—Report to Hazelhurst Field, Mineola, L. I., N. Y.
JMA—Rated as Junior Military Aviator.
JRC—Report to Jackson Field, Riverside, Cal.
KST—Report to Kelly Field, So. San Antonio, Tex. (When specified in the order, the number of the field is given in parentheses)
LDT—Report to Love Field, Dallas, Tex.
LHV—Report to Langley Field, Hampton, Va.
MAC—Report to March Field, Allesandro, Cal.
MAJ—Commissioned as Major, Aviation Section, Signal Corps.
MAT—Report to Mather Field, Sacramento, Cal.
MDO—Report to McCook Field, Dayton, Ohio.
MIT—Report to School of Military Aeronautics, Massachusetts Institute of Technology, Boston, Mass.
MJA—Commissioned as Major Air Service, National Army.
MJR—Commissioned as Major, Aviation Section, Signal Reserve Corps.
MSC—Report to Radio School, Maryland State Agricultural College, College Park, Md.
OBS—Attached to the Aeronautical Service as Observers.
OSU—Report to School of Military Aeronautics, Ohio State University, Columbus, Ohio.
PFO—Report to Post Field, Fort Sill, Okla.
PMT—Report to Park Field, Millington, Tenn.
PUP—Report to School of Military Aeronautics, Princeton University, Princeton, N. J.
PWM—Report to Payne Field, West Point, Miss.
REL—Relieved from present duty.
RSD—Report to Rockwell Field, San Diego, Cal.
RTR—Retransferred to organization attached to previous assignment to aviation duty.
RWT—Report to Rich Field, Waco, Tex.
SBI—Report to Scott Field, Belleville, Ill.
SAG—Report to Souther Field, Americus, Ga.
SGS—Report to Camp Sevier, Greenville, S. C.
SLA—Commissioned as Second Lieutenant Air Service, National Army.
SLR—Commissioned as Second Lieutenant, Aviation Section, Signal Reserve Corps.
SLT—Commissioned as Second Lieutenant, Aviation Section, Signal Corps.
SMA—Report to School of Military Aeronautics, Cambridge, Mass.
SMM—Report to Selfridge Field, Mount Clemens, Mich.
SRC—Report to Columbia School for Radio Officers, New York City.
TFT—Report to Taliaferro Field, Fort Worth, Texas. (When specified in the order, the number of the field is given in parentheses)
TMA—Report to Taylor Field, Montgomery, Ala.
UCB—Report to School of Military Aeronautics, University of California, Berkeley, Cal.
UIU—Report to School of Military Aeronautics, University of Illinois, Urbana, Ill.
UTA—Report to School of Military Aeronautics, University of Texas, Austin, Tex.
VBW—Report to Vancouver Barracks, Washington.
WAC—Report to Aviation Concentration Camp, Waco, Tex.
WCS—Wire to the Chief Signal Officer upon arrival.
WDM—Wire, Director of Military Aeronautics, upon arrival
WFO—Report to Wilbur Wright Field, Fairfield, Ohio.

Notes

Note 1—Report to places mentioned in order named for temporary duty.

Note 2—Report to Dis. Mgr. of Production, 480 Lexington Avenue, New York City.

Note 3—Take station at District office, Buffalo, N. Y. Wire DAP.

Note 4—Report to O i/c Aviation Fields, Chamber of Commerce Bldg., San Antonio, Tex.

Note 5—Report to Students Army Training Corps, Rensselaer Polytech, Troy, N. Y.

Note 6—Report to Aviation Officer, 90 West Street, New York City.

Note 7—Report to Chief Technical Section, Dayton, O.

Note 8—Report to Commanding Officer, Supply Depot, Middleton, Pa.

Note 9—Report to Naval Air Station, Miami, Fla. .....

Note 10—Report to Madison Barracks, Sacketts Harbor, N. Y.

A training biplane of Boche origin at one of the French aerodromes

FOREIGN NEWS

GREAT BRITAIN

The British official statement of October 4 said: British airmen have taken part during the week of September 29-October 4 in the American operations in Lorraine. They made a special point of attacking vital enemy railway communications south of Luxemburg. Thus in the twenty-four hours ended at dawn September 27 fifteen separate raids were carried out upon the railway triangle at Metz-Sablon, two upon the junction at Thionville, two upon the railway at Mezières, one upon Audun-le-Roman, one upon Ars, and two upon the aerodromes at Frescati and Plappenville, near Metz.

Other British airmen in the course of air-fighting over Northern France and Belgium last week destroyed 124 enemy machines, drove down 46 out of control, and shot down 34 German kite balloons in flames. Ninety British machines were reported missing last week.

Photographic reconnoissance over the enemy's lines has also been carried on simultaneously with the fighting, and an aeroplane authority, in discussing this matter, laid great stress on the fact that at the height of a conflict of unprecedented magnitude, during which immense exertions are demanded of the air service, British airmen should be quietly and systematically preparing the way for further advances by photographing the enemy's vital positions far behind the battle lines.

The duties of the air force, indeed, combine active participation in actual battles with preparation for operations yet to be undertaken. Last week between 8,000 and 9,000 air photographs were taken, of which more than 5,000 were made in fifty-six hours.

Bombing squadrons have also been busy during the last week. Nearly 300 tons of bombs were dropped upon German railways and other military organizations between the coast and the Somme, and the Belgo-British operations in Flanders were greatly assisted by attacks from the air on railway communications at Thourout, Cortemarck and Lichtervelde, on the direct routes from Bruges and Ostend to the retreating German line. Moreover, enemy reinforcements as they came up were attacked with bombs and machine gun fire.

The roadbed was destroyed in many places. Three trains were partly destroyed by fire, and direct hits were made on four others. Three large enemy ammunition dumps were exploded, and columns of horse transport were stampeded, while heavy casualties were caused by bombs bursting in the midst of massed troops.

As darkness fell on October 8 the sky was dotted with British aeroplanes, some hovering over the smoking and flaming battlefield, while others were on their way to add to the general confusion behind the enemy lines by dropping bombs on all sorts of targets. Throughout the day the British had had complete control of the air, bombing roads, barracks, massed troops, and batteries. German aeroplanes were seldom seen. The few enemy machines that did venture forth to places where they were not wanted were quickly engaged, and in aerial fights a considerable number of them were brought down.

The British Naval Air Force has been dropping seven tons of bombs every day upon the Zeebrugge bases for some time, which was a reason why the Germans decided to give them up. The blockading ships are still in the channel, but the Germans cut a hole through the wall and have managed to get some of their submarines out.

British aviators on October 9 bombed railways at Mezieres, Metz-Sablons and Thionville and aerodromes at Frescaty and Morhange, according to the statement issued by the Air Ministry.

Metz-Sablons was attacked October 10.

British airmen and gunners on the western battlefront destroyed 383 German aeroplanes in September. In the last seven days British airmen alone have destroyed 89 German machines and driven down 27 out of control. These figures take no account of French, American, and Belgian successes.

The fighting of the British airmen during the last week has been of a remarkable character. During the earlier part of the week the brunt of the air fighting fell upon British squadrons operating between Lens and Le Catelet, especially over the great network of railways of which Valenciennes, Douai and Cambrai are the vital junctions. Taking advantage of every possible opportunity both by day and by night, the British airmen maintained a virtually continuous offensive against these centres, including the station at Mons and the smaller though vitally important junctions at Aulnoye, south of Valenciennes, and at Busigny, where the line forks toward Cologne and Brussels.

Prior to the early hours of October 8, when the British infantry attack between Cambrai and St. Quentin was launched, 163 tons of bombs were dropped by British airmen upon these and other military objectives.

Fifty-three British machines were reported missing in the course of the last week.

It is understood that the Germans are no longer attempting to use the Flanders coast for sea operations of any description. They have stripped their bases there of all vessels and have left virtually no seaplanes.

The mouth of the harbor at Ostend has been blocked by the Germans, and there is little doubt that similar steps will be taken at Zeebrugge.

The independent air force on October 15 bombed the Frescati aerodrome and blew up a Zeppelin shed, according to an official announcement.

Two large Swiss flags were borne by the Swiss balloon destroyed near Berne by a German aeroplane. In addition, two federal crosses were painted on the balloon. Two aeroplanes were discovered coming from the east and following the German-Swiss frontier. The observer signalled to have the balloon drawn down. This operation had begun when the aeroplanes, whose German marks were seen, flew several times around the balloon. One aviator fired a machine gun at the balloon and threw a bomb, which set fire to it. The aeroplanes then disappeared. The German Minister has expressed his regrets and promised punishment of the guilty aviators.

The British and Australian airmen on the Turkish front and the infantry had forced the enemy into the road just as the guns began to shell the retiring transport. The airmen swept down to an altitude of 200 feet and bombed the head of the column. Once that was accomplished at the front, only time was required to finish the job. It was done with surprising thoroughness, one flight following another until the whole column was a vast broken mass.

The enemy troops, seeing that escape for the vehicles was impossible, fled to the hills and fell into the hands of the cavalry or sought refuge in our lines. The Irish and Indian troops in thirty-six hours marched twenty-one miles as the crow flies, over a succession of mountains and rocky valleys, fighting incessantly.

The airmen were busy on September 23 in the Es-Salt and Amman area, bombing the enemy, and also attacked the station at Mafrak and the aerodrome. Direct hits included one hangar, which burned.

An official statement on the operations of the independent air forces issued October 22 says:

Two of our squadrons attacked the barracks and railways at Metz Monday. Another squadron set out to attack the factories in Rhine towns, but the formation was split up by the dense fogs. Seven machines have not up to the present been located. Monday night we dropped heavy bombs on the stations at Mezieres.

FRANCE

The French official report on aerial operations on October 9 says:

October 8 atmospheric conditions unfavorable for flying permitted us to carry out only restricted work. Three enemy planes were brought down and two captive balloons were burned.

During the night the weather improved and our bombing squadrons took the air. They dropped more than twenty-six tons of projectiles on the stations at Marle, Mont Cornet, Rethel, Asfeld-la-Ville, Juniville and Chatelet sur Retourne and on the railroads between the stations. Fires and explosions were caused at various points.

A very large number of aerial reconnoissances were made well over the enemy lines with success on October 9. Important assemblages of the enemy were reported in the region of Etraye, Manvillers and Mourey.

French bombing machines operating in mass formations threw down with most satisfactory results 32,600 kilograms of bombs and fired several thousand cartridges against enemy troops and convoys. In the course of these operations twenty-one enemy aeroplanes were destroyed or put out of commission. In the course of the night a very heavy fog made it impossible for us to drop more than 5,300 kilograms of projectiles on the railroad stations at Longuyon, Dommarie-Baroncourt and Audun-le-Roman.

The official communication dealing with aerial operations says:

On October 10 our bombing squadrons carried out important operations, dripping more than 35,000 kilos (77,000 pounds) of projectiles on enemy concentrations and convoys in the region of Vouziers and on a munition depot, which exploded.

Numerous combats were fought, in the course of which seventeen enemy machines were brought down or fell disabled, and eight balloons were burned.

Our observation machines continued to fly behind the enemy lines, reporting numerous fires which the enemy had set in the course of his retreat.

During the night our bombing squadrons continued their work of dropping 24,000 kilos of explosives on bivouacs in the region of the stations at Longuyon, Hirson, Attigny, Pauvres and Mont Cornet, and on convoys and trains.

ITALY

On October 4 our bombing squadrons bombarded with great success the enemy's lines of communication, and at a low altitude machine-gunned the aviation field at Tirana. The renewal of favorable atmospheric conditions increased the aerial activity. In an aerial fight four enemy machines fell.

On October 5 the activity of our bombing squadron was considerable during the entire day, making their effects felt on depots and on concentration camps. The results of the numerous aerial fights were four enemy machines sent to earth.

On October 6 our aviators were very active. Enemy squadrons attempted to pass the lines at Val Lazarrina, but they were faced and put to flight. One enemy machine fell on Lusegana.

The enemy aviation fields at Alto Adige were bombarded with great success by our squadrons, and with incendiary bombs the destruction of the hangars were accomplished. Other squadrons bombarded the rear of the enemy's lines on the Alsipiano di Asiago.

During the nights of the 6th and 7th our dirigibles bombarded with great effect the enemy's aviation fields in the Venetian Plains and the military camps of Premolano and Uscine. During the numerous aerial flights two machines fell to the earth.

GERMANY

Great headquarters has issued the following:

During September 773 enemy aeroplanes and 96 balloons were destroyed on the west front. In spite of enemy superiority in numbers, we lost only 170 aeroplanes and 103 ballons.

British Aeroplane Takes 65 Germans Without Landing

London.—Two British aviators, flying low in one machine, recently brought about the surrender of sixty-five Germans, and without leaving their aeroplane shepherded the party across No Man's Land to the British lines, according to a story from the battlefield made public on September 24.

The pilot and his observer had been attacked from a trench and sunken road. The pilot dived and replied to the enemy fire with his machine guns killing one and wounding three. The Germans in a panic ceased firing and hoisted a white handkerchief.

As there was no British infantry in that neighborhood, the pilot descended to within fifty feet of the ground and motioned the Germans out of the trenches, circling around them to insure that none escaped. All were safely brought in and handed over to the nearest British troops.

The aviators then resumed their patrol.

Famous French Ace Missing

Paris.—Sub-Lieut. Boyau, one of the famous French aces, is reported to have been missing since September 28. He is credited with thirty-two aerial victories.

Sub-Lieut. Boyau began to figure in the reports of exploits of the French aviators in the present year. By the month of June his record of aerial victories had reached a total of fourteen. It jumped rapidly during late June and July, until on August 1 it was reported as twenty-nine. Particular mention was made of three victories he scored in late July, each of which was won in not more than ten minutes.

Model Aeroplane Building as a Step to Aeronautical Engineering

The Designing and Building of a Man-Carrying Aeroplane

WE now enter into the most difficult and intricate part of our work, as every part of the aeroplane must be designed to do its work with the maximum of efficiency and must be of the greatest ultimate strength, at the same time weighing as little as possible. The writer does not intend to cover the whole course of aerodynamics or aeroplane design, as this alone would take a large book, but we will design a light horse powered machine and select from tables and data given in authoritative books those figures which we will need to apply to our machine. In this way the reader will grasp the method used by aeronautical engineers in laying out the plans of a machine.

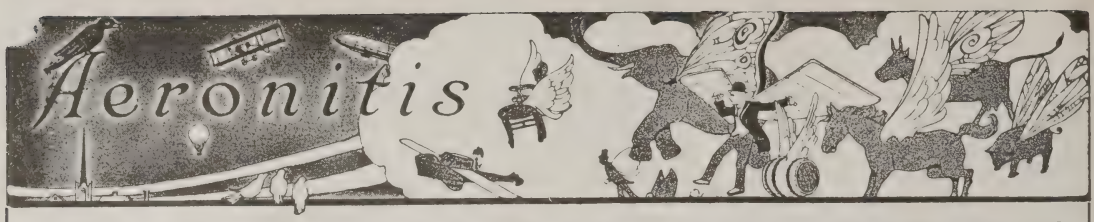
That these theoretical figures are correct was proven by the fact that a certain aeroplane was designed to weigh 1300 pounds with a 150 horsepower motor and to travel at the rate of 135 miles per hour, with a landing speed of 60 miles per hour, and when built and flown it did not vary from the figures 5 per cent.

Tables of the lift and resistance of different wing sections at angles of incidence varying from zero to 16 degrees are available, also skin friction, resistance of bodies, struts, bracing wires, etc.

The reader will remember that the angle of incidence becomes smaller as the aeroplane gains speed. For instance, if the angle is 16 degrees at a speed of 45 miles per hour, it will gradually become smaller as the speed of the machine increases until the machine reaches 95 miles per hour, when the angle is only a fraction over one degree. It is also worth while to remember that the greater the angle of incidence the greater the resistance. (For further reference I would advise the reader to get the book on Aeroplane Design by Judge, Barnwell, Rathbun, or Klemin at the Aeronautic Library, 299 Madison Avenue, New York City. These books contain all the data necessary to design an aeroplane. If the reader is not well up on mathematics, I would advise Klemin & Huff's Book on Aerodynamics and Aeroplane Design.)

The machine shown in the accompanying illustration is powered with a 35 h.p. motor and was built by E. H. Holterman, former civilian instructor in the Government Service. The data and drawings of this machine was furnished by the writer. The spread of wings is 26 feet, the overall length being 20 feet and the weight only 550 pounds.

The machine we are about to build will be lighter and with a different wing curve than the one shown in the illustration, as Mr. Holterman wanted speed, while we will strive to get a medium fast machine to carry a small useful load.



The cost of building a small machine runs about $300.00 or so, according to the work done by the builder. If the parts are bought from a Supply House the cost will be about twice the amount, but of course the workmanship will be better.

I would advise making full or at least half size drawings of each part of the machine before attempting to build it, because each part of the machine must be exact or the assembly of the machine will be impossible.

We will accept standard practice and copy the machine shown below as closely as possible, except placing the radiator over the engine instead of in front to assist the less experienced reader in building the machine.

Mr. E. H. Holterman, former Civilian Instructor and tester for the U. S. Government, and his Ford-motored aeroplane

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

I Ain't Got It

Y'all ask me don't I want to go afloatin' troo de sky,
Askimming like a buzzard, or a-buzzin' like a fly?
Well, Boss, my laigs is good, and what it takes to want to die—
I ain't got it.

Uh, uh, I ain't no slacker what's afraid to go to war;
I done been married twice myself, so I been there before.
But what it takes to drop them bums above the cannon's roar—
I ain't got it.

Dis nigger ain't partic'lar good, he's gettin' old an' fat;
His teeth an' hair an' wind's done gone, an' little things like that.
But 'less I takes to drinkin' milk—get crazy like a bat—
I ain't got it.

I'll yell, "Come on and get it," good an' loud three times a day,
An' help to lick the Kaiser in my bes' chow-chuckin' way;
But ridin' in a airyplane? please, Boss, jes' let me say—
I ain't got it.

Some day when I is dead an' gone, an' wearin' reg'lar wings,
An' wearin' out a pair o' bones with other angel things,
Jes' come an' fly up to de sky an' lissen, while I sings—
I ain't got it.

"General Staff"

A passenger train arriving with 200 soldiers, many of whom were officers, attracted the attention of two negro bootblacks. As the officers walked by "Sambo" and "George" would exclaim—"Dat's a capting" or "He's a leftenant," as the case might be.

At last a French soldier in his natty blue-gray uniform passed by.

"What's he, Sambo—a kunnel?" asked George.

"No, George, dat's dis yere General Staff."

The Spinning Nose-Dive

The simplest stunt a pilot tries
Yet half the blooming time he flies
The damn thing gets him by surprise—
a spin.

Too steep a bank—too flat a turn,
Then like a rolling butter churn
Friend bus will pitch and twist and turn.
So save your blighted neck and learn
To spin.

R. I.

Owed to a Night Bomber

Hear! Mecano, ere you crank,
This foolish looking flying tank!
Let me on your mind impress
With the utmost earnestness,
Grasp this order without fail,
Don't get tangled in my tail.

Knight o' the sparkplug, hear my vow,
There will be one hellva' row.
Take it even now from me,
It'll be the end of you an' me.
If you'd escape my rage
Guardez vous mon empennage.

Flying Indeed!

A shrill whistle sounded from the orderly tent, and our Sergeant Kellar yelled, "Who wants to go flying?" Out of six tents there madly rushed twelve enthusiastic individuals, each eager for his first trip.

"We do!" they cried eagerly, crowding closer.

"Good!" said Kellar, as he handed each crestfallen youth a wire fly swatter, "I guess the best place for flying is in the mess hall; there are plenty there."

Tommy Atkins Scores

Private (*to newly promoted lance-corporal*) What 'they gives such blokes as you stripes for beats me.

Lance Corporal—Not for bein' lazy, anyhow.

Private—No; I knows all about that, 'cos if they did you'd look like a bloomin' zebra.

Cylinder Grinding Machine

For grinding Aeroplane and Automobile Engine Cylinders, as well as other kinds of internal grinding.

Grinds holes from 3 in. up to 7 in. in diameter and 14 in. deep.

Can be equipped with wet-grinding attachment if desired.

This machine was formerly made by Brown & Sharpe Mfg. Company.

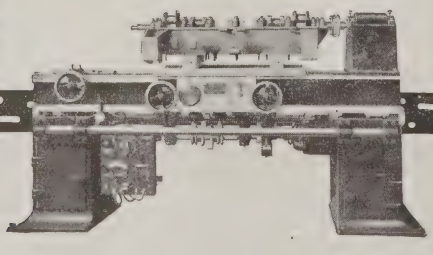
BALANCING
MOLINE TRACTOR CRANKSHAFTS

Even in a husky product like a farm tractor, vibration is a very important item and manufacturers of the highest grades take great care to secure as near accurate balance of their crankshafts as possible.

To get *static* balance on level ways is a comparatively simple matter but to find the *running* unbalance of a long cumbersome crankshaft and correct it exactly, has previously been one of the most bothersome problems to both mechanics and engineers.

The above illustration shows how the Moline Plow Works have solved this in their Tractor plant with a



CARWEN
Dynamic Balancing Machine
(Lundoff Patents)

With ordinary shop skill, it is now possible to accurately locate where and measure exactly how much metal should be added to (or removed from) a crankshaft to put it in precise running balance.

Carwens are being successfully used by the largest electrical concerns for balancing armatures and turbine rotors; by the leading gas engine manufacturers, for airplane, passenger car and truck crankshafts and in all cases the cost of purchasing and operating is practically negligible as compared with the gain in output and increased efficiency of the product.

Made in sizes suitable for balancing objects weighing from 5 oz. to 15,000 lbs. Write for our illustrated catalog.

American Ace Gets His Eighth Plane

Paris.—Continuing his remarkable air exploits, Sergt. Major Edwin Parsons, the American flying ace attached to the French escadrille, has just shot down another German machine, this making his eighth. Parsons met his latest adversary well over the German lines and peppered him with machine gun bullets before the German pilot had time to turn and fire at the American.

The enemy machine immediately burst into flames and fell crashing to the earth.

Rio Newspaperman Now a Cadet Here

Cadet Annibal Bomfim, of Brazil, who at present is taking the flying course at Kelly Field, with the view of returning to his native land and teaching the art to his fellow countrymen, is an experienced newspaper man, having been a member of the staff of *A Noite*, the largest evening daily published in Rio Janeiro. Since coming to the United States, Mr. Bomfim has written a number of articels describing his native country for the Philadelphia *Public Ledger*, which shed new light on the "land of the Southern Cross," as he affectionately terms it.—*Kelly Field Eagle.*

American Flyer Dies of Pneumonia in France

Paris.—Lieut. Walter S. Rheno of Martha's Vineyard, Mass., an aviator in the Lafayette Escadrille, died on October 13 at the American Hospital in Neuilly of pneumonia. He had to his credit several German aeroplanes and had been decorated with the French War Cross.

Mail Flier Makes Forced Landing

Pilot Maurice Newton, of the Aerial Mail staff, was on a special trip from Philadelphia to Belmont Park to test the mail carrying capacity of a plane on October 18 when he discovered that his gas pressure was low. He was over South Jamaica and about two miles from Belmont Park when he sought to land on the links of the St. Albans Golf Club. Trees prevented his landing and he came down in a field at Merrick Road and Locust Avenue, landing rapidly on very rough ground. The plane was only slightly damaged.

140 AMERICAN PLANES BOMB GERMAN TROOP CONCENTRATION CAMPS

THE following Associated Press despatch indicates that the American air forces are participating in hostilities on the Western Front on a huge scale:

"German troop concentrations in the region of Briquenay, north of Grand Pré, were bombed this afternoon by about sixty all-American bombing aeroplanes, with about eighty pursuit planes protecting them. Formations of from fifteen to twenty German machines attempted to drive off the Americans, and several aerial combats resulted.

"Lieutenant Edward Rickenbacher was among the airmen in pursuit planes accompanying the bombing squadron. He engaged in two aerial combats and brought down a German machine within the American lines near Exermont. Rickenbacher followed the enemy machine close to the ground until he saw the enemy aviator land and fall into the hands of American infantrymen. Returning to his aeroplane, Rickenbacher heard the news of his promotion to a Captaincy.

"The weather was fairly clear when word came that German troops were arriving at Briquenay by trains and that they were marching and being transported toward the Bourgogne Wood. An expedition was quickly organized and was soon on the wing.

"In addition to bombing Briquenay and the railroad, the bombers dropped a few bombs in woods near by, and the pursuit planes attacked enemy troops with small bombs and machine guns. The bombers report excellent results, direct hits being obtained upon railroad sheds.

"Two American planes are reported missing. Over Grand Pré the left wing of a plane was struck by a German anti-aircraft shell and the machine fell in flames within the German lines. The identity of the machine is uncertain, but it is believed to have been an American.

"To be shot down twice within a week by German airmen has been the experience of Lieutenants Arthur Newell of Berkeley, Cal., and Walter Ten Eyck, Jr., of Brooklyn. Both times the Americans landed within their own lines. They declare they brought down two German machines in their encounters with the enemy. Lieutenant Newell acted as observer and Lieutenant Ten Eyck as pilot.

"Accompanying the all-American bombing squadron on Oct. 18 their machine was attacked from the rear by five Germans. Lieutenant Newell, at the machine gun, saw one of the Germans fall. The others continued firing and the gasoline tank of the American machine was pierced twice, but the momentum of the aeroplane prevented the gasoline from escaping and catching fire.

"Lieutenants Newell and Ten Eyck were members of a day bombing squadron which flew over Buzancy last Wednesday. On the return they were attacked by three German machines and brought down one of them. The engine of their machine was pierced by a number of bullets and put out of commission, but the Americans landed safely south of Brieulles. In the fight a bullet grazed Newell's nose, while another bullet bruised Ten Eyck's cheek."

2,500 Planes Sent Over in 5 Months

Production of American aircraft has reached a state where it is limited practically only by facilities for transporting the aeroplanes to France. The production of Liberty motors during October reached one thousand a week—a goal which had not been hoped for at the soonest until December.

The latest official compilations show that since June 1 approximately 2,500 fighting aeroplanes of all descriptions have been shipped to the American forces in France.

AVIATION CARNIVAL AT BELMONT PARK A STUPENDOUS EVENT

THE greatest aerial carnival ever held, an event such as would sell a billion dollars of Liberty Bonds, was the Carnival organized by Mrs. Charles A. Van Rensselaer, the chairman of the National Aeronautic Committee, and held at Belmont Park on October 26th.

It would take many pages to give a complete account and lack of space prevents it.

A billion dollars or more in Liberty Bonds could have been sold because the event was so stupendous that about 50,000 people were enthused and wrought up to the highest pitch.

It was the eighth anniversary of the first international aviation meet, which was held at Belmont Park at the end of October, 1910. Then John Moissant and Grahame White raced to the Statue of Liberty for the $10,000 prize offered by Mr. Thomas Fortune Ryan through the Aero Club of America. The race to the Statue of Liberty on October 26 was for the trophy and Liberty Bond offered by the Aero Club of America to assist Mrs. Van Rensselaer in her great work of supplying aviation fields with athletic equipment, swimming pools, etc.

This race was only one of many events, but was the one event for which everybody waited impatiently. The different aviation fields had been grooming their pilots and machines for this event and as much practice and test took place as if the squadrons were preparing to bomb Berlin.

When the seven De Havilands started for the race, they disappeared like many darts, and the roar of the big Liberty twelve motors grew fainter and fainter, the excitement grew more and more intense, and the fifteen minutes and thirty-one seconds which it took the winner to make the trip of thirty-six miles appeared as many hours.

When the first two planes appeared the crowd roared in excitement and enthusiasm and army aviators hugged each other on discovering that the plane with the white arrow, piloted by Sergeant Frank Coombs, of Hazlehurst Field, was first and planes from Roosevelt Field were second and third. The names of the pilots were not announced.

The crowd had cheers for all. It certainly was an enthused crowd—and the only regret was that there were no Liberty Bonds to sell.

Then Sergeant Coombs and Lieutenant Breeze were rushed over to the official stand, to be received by the officials who included Mrs. Van Rensselaer, Colonel F. M. Davis, who represented General Kenly; Mrs. Henry A. Wise Wood, Mr. Alan R. Hawley, president of the Aero Club of America;

Henry Woodhouse, Augustus Post, Lieut. Colonel I. Jones, Walter Camp, Major Thomas Hitchcock, Major J. S. Phipps, Major John J. O'Connor, Surgeon Gen. M. O. Terry, of New York, Captain and Mrs. Wharton, Mrs. Clinton Gilbert and some of the military aviators, including Lieut. Earl Carroll.

Exactly eight years before Messrs. Hawley and Post had been received in exactly the same way on their arrival at Belmont Park on their return from the historic balloon trip from St. Louis to Canada, after having been lost for six days in the wilds of Canada, and John Moissant had been received the same way for winning the Liberty Race.

Mr. Hawley officially pronounced Sergeant Coombs the winner and Colonel Davis said something to him which doubled his pleasure.

Of the seven DeHaviland machines which took part in the race, four were made by the Standard Aircraft Corporation, two by the Dayton-Wright Co., and one by the Fisher Body Corp. The machine that finished first was a Standard machine. No. 2 was a Dayton-Wright machine.

The other events were run off perfectly except that Lieut. Meany, after easily winning from Louis Chevrolet a race in which automobile was hopelessly matched against aeroplane, spiralled suddenly when too near the ground in an attempt to land and bumped into old Mother Earth head on. One of the wings broke the force of the fall. Lieut. Meany climbed out and waved back an ambulance which clanged across the field. He said he was not hurt, which proved to be the case, and the plane was not damaged irreparably.

Plenty to See

Late arrivals missed an opportunity to have their hair raised. The gentleman who supplied this opportunity was Capt. Jacques Boyriven of the French Aviation Mission. Capt. Jacques suddenly bobbed up with the tiniest machine on the field, a bright red Nieuport, which compares with the Caproni about as a chipping sparrow with a condor. Its wing spread is less than thirty feet; the Caproni's about seventy-five. In action, guided by Boyriven, it is a flying minnow; that is, if anybody ever saw a bright red minnow. It darted hither and thither, up and down, like a demented bug, and these metaphors are no more tangled than the Nieuport threatened to be with the crowds of gasping spectators whom Capt. Jacques delighted to scare.

Every little while this tantalizing scarlet apparation disappeared behind the stands. Then, when the people felt safe once more, it came buzzing past the stands, the whole length of them, not more than twenty-five feet above the heads of the crowd on the lawns. It seemed to dive straight down at the crowd in front of the field stand, and then, just when they were bursting their shoe laces in a scramble to get away—Zoom! Up Capt. Jacques's red beetle shot toward the zenith. Twice it came winging between the field and grand stands, lower than their roofs. The second time it did this a man on the ground not more than twenty feet beneath the Nieuport tossed up his derby hat. Just by luck the hat missed being drawn into the propeller.

An encounter with even a small bird is dreaded by an aviator, the catastrophe that might be caused by collision with a shell-proof derby hat can be imagined. The Nieuport kept away from the crowds after that, and contented itself with skimming the inner field, darting straight at the old judge's stand and then, when everybody closed his eyes to shut out the smash, frisking upward and over the little building with a flirt of its saucy tail.

Captain Williams of the United States Army was meanwhile manœuvring in stately fashion in the big Caproni. The Nieuport cut disdainful circles around him. Altogether Captain Jacques and his zoological wonder, be it minnow, bug, flying flea or hoptoad, certainly enjoyed themselves on this pleasant afternoon.

Bombing is Demonstrated

Later the thousands of eager witnesses saw just how bombs are dropped at the front. There was a circle marked by four white flags near the middle of the infield. The planes flew over it and a smoke bomb dropped within the circle was a "hit." Two squadrons of aviators, in the machines actually used for this kind of warfare, competed, one machine of each squadron releasing the bombs while the others protected it from imaginary attackers. On hitting the ground the smoke bombs that were used exploded with a bright flash and a burst of smoke. There were eight of them and all seemed to strike within the circle.

At the same time rival teams were playing pushball, Roosevelt Field beating Mitchel Field and Lufbery Field beating Hazlehurst Field.

In the air and land race Louis Chevrolet drove the same Frontenac with which he won the Harkness trophy at Sheepshead Bay last year by making 110½ miles an hour for 100 miles. Lieutenant Meany, the airman in the race, piloted a Thomas-Morse plane with Le Rhone motor, the single-seated machine in which fighters are trained. Chevrolet had no chance anyway and dust on the track was ankle deep. Lieutenant Meany chivalrously held his mount back from time to time so that the little red automobile might run a dead heat, as in the good old circus chariot races. But after birdman and groundman had circled the 1½-mile track three times the biplane scudded home away ahead.

While blue and orange and crimson aeroplanes cavorted on high officers from Mitchel and Hazlehurst fields stripped to running clothes and had a relay race. They're in the army now, but not so long ago they were college headliners. For Hazlehurst there ran Captain Holden from Yale, Captain Babcock from Worcester Tech, Lieutenant Joy from Holy Cross and Lieutenant Billy Queal, once a professional runner and coach of the Yale cross-country team. For Mitchel Field the colors were carried by Stallenwerck from Johns Hopkins, Higgins from Cornell, Hinman from the University of Chicago and Fred Kelly from the University of Southern California, winner of the high hurdles event in the last Olympic Games and a famous sprinter as well. But Kelly was the last man to run for his team in the relay. His team was behind and he could not close the gap.

Motorcycle Relay Race

Ten of those motorcycles with side car attachments also had a relay race, two men to a machine, one piloting it, the other riding in the side car and plunging out of it and into the car ahead when the relay point was reached. Roosevelt won, Hazlehurst was second and Henry J. Damm Field third.

The stunters got busy overhead. A flock of little Thomas-Morse scouts flip-flopped through most of the loops, turns, falling leaves, barrel rolls, tail spins and various dives in the curriculum of the master aviator.

Fifty-three biplanes set hearts throbbing again when they rose for formation flying. Whole squadrons were exhibited in concerted stunts. The climax was superb. The whole fifty-three straightened out in the sky and descended at once. It looked as if they couldn't possibly do it within the Belmont Park enclosure, but they did. Within twenty seconds from the landing of the first machine the last one was motionless on the ground.

UNCONDITIONAL SURRENDER

"Sublimist word in English tongue
  Is Duty," said the peerless Lee,
And Duty's bravest flag is flung
  That all the world may yet be free.
Our Duty to our God and land
  Was never so distinctly set,
There never was a chance so grand
  To do so much without regret.
Then force the Vandals to their knees,
  Remove the fangs that tear mankind,
Keep sending freemen o'er the seas
  And strike the foul beast dumb and blind.
"Surrender Unconditional"
  Is blazoned on our battle flag
No half way measure shall enthrall
  The earth now free as mountain stag.
And untold millions raise the skies
  In loud acclaim unto our Lord
That after all our sacrifice
  The beaten foe must drop the sword.

—George L. Upshur.

Oct. 9th, 1918.

THE NEWS OF THE WEEK

One Thousand Officers and Twenty-five Thousand Men Wanted for the Balloon Service

One thousand officers and twenty-five thousand men are wanted for the balloon service. Application should be made to the Training Section, Balloon Branch, Bureau of Military Aeronautics, Washington, D. C.

The Balloon Service affords a splendid opportunity for front line service, not only for the officers, but also for the enlisted men, because the balloons are operated near the front line and every member of a balloon company is, therefore, near the front line.

Colonel A. L. Fuller, the head of the Balloon Service, and Colonel James Prentice, Major J. C. McCoy, Major Thomas S. Baldwin, Major A. B. Lambert, A. Leo Stevens, Major Max C. Fleischman and other pioneers in the balloon game are justly proud of the Balloon Service. It has done splendid work overseas under the able direction of Colonel Charles de F. Chandler, Colonel Frank P. Lahm, Colonel Ira Fravel, and the other able officers in charge of the Balloon Service overseas.

General Harbord Makes Air Flight

Paris.—Major-General James G. Harbord, head of the supply service of the American Expeditionary Forces, visited the aviation school on October 10. He made the trip with Colonel Kilner, chief of the school, in an aeroplane.

The two officers had met at the supply service center and during their talk General Harbord said that the proper way to visit an aviation school was to fly there. Half an hour later he left his headquarters in an aeroplane equipped with a Liberty motor and piloted by Colonel Kilner. At their arrival at the school, sixty miles away, they were met by Colonel Bingham, who is in command there. They inspected the camp and motored to nearby centers, the nature of which are not disclosed at present. After lunch they returned by aeroplane in time to finish the day's work. No one at the supply service headquarters knew the General had been away.

Fliers' Bombs Make Big Catches of Fish

Aviators training at Rockaway for the purpose of excavating a large part of the Kaiser's real estate holdings with high explosive bombs are aiding the residents of that section to get their food supply. Likewise, they are conserving fish worms, live frogs and fishermen's time.

Shortly after the new fort was established at Rockaway Point, the aviators began flying over the water and dropping explosive bombs guaranteed to put a submarine on the fritz, or to make a dent in any German town where they happened to fall.

Fishermen learned that when the bombs went off they killed large numbers of fish, so they geared up their motor boats and proceeded to wait at a safe distance until the practice bombs were fired. Then, when the column of spouting water told the story of a newly fired bomb, the boats were sent at top speed to the scene and all the fishermen had to do was haul in the catch.

The scheme was unfolded when two fishermen came into Freeport, L. I., with 600 pounds of fish that brought record prices. All were caught with an aviator's bomb.

Chaplains Take 'Plane to Mass

Paris.—Aeroplanes and tanks are being used by volunteer chaplains and field secretaries with the Knights of Columbus, to serve the American soldiers over here.

Two chaplains, the Rev. John Moran of Eugene, Ore., and the Rev. John Sullivan of Tuckahoe, N. Y., were the first priests to make their rounds by the air route. The Rev. Mr. Sullivan uses aeroplanes several times a week, and thus is able to visit field hospitals within a redius of 200 miles of his camp.

Aeroplane transportation was used by the Rev. Mr. Moran for the first time when he received two calls to say field masses one Sunday morning. The call came from villages fifty miles apart, where troops were billeted. An aviation pilot solved the problem for Chaplain Moran by offering to take him to both places, and he went. The result was a field mass at one village at 6 o'clock in the morning and another mass in the village fifty miles farther on at 7.30 A. M.

U. S. Aviators Maintain Night Patrol at Front

With the American Armies Northwest of Verdun—American aviators, by inaugurating night patrols along the Meuse, have attracted much attention among the airmen of other nations. Under the present plan the air forces are always subject to call from the front, where observers or listeners report by wire when the motor of a German aeroplane is heard approaching the American lines.

As soon as one of these reports is received the American searchlights begin sweeping the sky. The American night patrols arrive at the same time. In event the German machine is located by the ray of a searchlight the American machines attack until the enemy is downed or makes his escape.

Ensign Robert Stocker, son of Captain Stocker, U. S. N., and his observer ready to start out on patrol

Fliers to Drop Smokes to U. S. Prisoners

With the American Army in France.—Americans are planning to supply American airmen now prisoners in Germany with cigarettes by dropping packages over the enemy line at regular intervals, addressed to individuals known to be in the various camps.

A card has been received at aviation headquarters from Lieutenant Alan F. Winslow, of River Forest, Ill., asking the American airmen to send him cigarettes as soon as possible.

Signor Eugenio Chiesa, Secretary of Italian Aviation, getting ready to take a flight

Chicago Flier Downs Hun

With the American Army Northwest of Verdun.—Aviator Will Ervin, of Chicago, had a busy day Friday. Early in the morning he brought down a German aeroplane near Fleville. Later he participated in the all-American raid behind the German lines, acting as one of the scouts protecting the bombing machines.

Our Aviators Downed 261

With the American Army in France.—Between September 12, when the St. Mihiel drive began, and October 19 United States Army fliers brought down 261 German planes, which represented one-seventh of the total flying strength of the enemy from the Swiss border to the sea.

Sky Full of Aeroplanes

October 24 was marked by perhaps the most active aerial warfare we have seen. The sky was filled with machines all day. More than a hundred American bombing machines dropped several tons of bombs on German positions. The Germans retaliated with weak day bombing, but that night bombed the back areas of the American forces with vigor.

There were many air battles along the front. Four of our lieutenants—Woolsey, Manning, Humes, and Colson—met four Fokkers at a height of 3,800 metres. The Germans accepted the challenge, and in view of thousands of soldiers the four German machines were seen to come down. None of our airmen was hurt.

An idea of what our day bombers are doing may be gained by the statement that two tons of bombs were dropped on Buzancy to-day. Many fires were started in German depots.

Wounded Aviator Wants More Fight

Lieutenant Eddie Rickenbacker, the American flier who zoomed into fame through a series of daredevil flights over the German lines, is in a hospital in Paris suffering from an injury received in the cloud battle in which he downed his eighth Boche plane. Both of Rickenbacker's eardrums are split. Recent despatches mentioned the fact that the aviator had been injured, but failed to supply details.

Lieut. Frobisher Killed in Aerial Combat

Lieutenant J. Edwin Frobisher, Jr., of the American Aviation Section, died on September 10 of wounds received while he was in combat with a superior force of German aeroplanes. He was one of several American fliers who went aloft to drive off a squadron of German planes which had attacked the American lines. In the fighting which followed, and which ended in victory for the Americns, Lieutenant Frobisher was wounded. He was twenty-three years of age and a native of Arlington, N. J.

Best Day for Our Airmen

With the American Army Northwest of Verdun.—American bombing aviators on October 18 attacked Bayonville, Buzancy, Remonville, Briquenay, Verpel, Cery-Le-Grand, Aincreville, and Imecourt, each town being a German supply point or an army unit headquarters. They downed ten German machines.

Simultaneously with the bombing expedition two squadrons with small bombs and machine guns attacked German infantry along the roadways leading to Landreville and Landreset-St. Georges.

The day is considered the most successful in the history of American military aviation.

Syllabus of Observer's Course

Washington.—Men of good education, sound judgment, quick perception and action and iron nerve are required by the United States Air Service for duty as aeroplane and balloon observers in France.

General Pershing recently called for an increased number of observers, and the War Department, on behalf of the Air Service, announced the qualifications necessary for the work, and what the supplementary courses of instruction will be after the candidate has been accepted. The different courses of instruction will cover about twenty-three weeks.

Civilians applying for work must undergo the same rigid physical examination as pilots. Accepted applicants are first sent to a ground school, where instruction on general military matters is given and work on wireless telegraphy, machine guns, and in the interpretation of aerial photography is begun. The course lasts eight or nine weeks.

From the ground school successful applicants are sent to one of the Schools of Fire—the Field Artillery at Fort Sill, Okla., or the Coast Artillery (heavy) at Fort Monroe, Va.

Completing the artillery course of seven weeks, the men will be sent to the observers' schools at Fort Sill or Langley Field. This course will cover about five weeks, but will fit the men for any duty required of observers.

To complete their training, just before sailing, the observers will be sent to Selfridge Field for a three-week course in aerial gunnery. No definite age limit has been fixed for observers.

Lieut. Winslow a Prisoner

It has been reported by the American Red Cross that Lieutenant Alan F. Winslow, American Air Service, France, is now a prisoner of war in Camp Lazarett, Germany.

Lieutenant Winslow achieved the honor of being the first American aviator with the A. E. F. to bring down an enemy plane, April 14, 1918, which action was immediately duplicated by Lieutenant Douglas Campbell, of Harvard University and California.

Until the recent report from the Red Cross Lieutenant Winslow was believed missing in action since July 31, after a fight in the air northeast of Fere en Tardenois. His father, W. H. Winslow, a munition manufacturer, of Chicago, Ill., has also been advised by the Red Cross in Paris that his son is a prisoner at Tier in Germany, where he is doing nicely, although his left arm has been amputated.

Confirmation of Lieutenant Winslow being a prisoner has also been received from his brother, Lieutenant Paul S. Winslow, American Air Service, London.

American Aviation Abroad

Hon. Franklin D. Roosevelt, Assistant Secretary of the Navy, who recently returned from a long tour of American naval bases and stations, to-day gave to the press the following review of United States naval activities abroad:

All the way from the Spanish border clear around to the English Channel we have established aviation stations so spaced that the entire coast line is covered by seaplanes and dirigibles. Nearly all these stations are located at out-of-the-way points, some placed on uninhabited islands, others in fishing vessels on peninsulas. Labor was almost impossible to get, so these stations were built almost entirely by our own sailors. At each station there is an average of from 200 to 300 men. This aviation force and our patrol vessels have been doing such splendid work that for the past six months there have been practically no sinkings within fifty miles of the French coast. We hope to extend this patrol zone to a hundred miles, so that the submarine will be driven still further out, increasing the difficulty in attacking vessels. We have on one of the lakes close to the coast a large aviation school for bombing practice and the general training of aviators. At one point we have an immense assembly and repair base which employs over five thousand men. An instance of the way in which every bit of material has been utilized was at this base, where, before the erection of permanent quarters, the men took the packing cases in which the planes were shipped and converted them into barracks which were very comfortable.

In northern France, in coöperation with the British and Belgians, we established what is known as the Northern Bombing Group, composed of a number of aviation units. This was organized originally for bombing the submarine bases on the Belgian coast. It was in active operation all summer and did much to prevent the use of Zeebrugge and Ostend by the Germans. After the British had blockaded the entrance to those harbors Germans were prevented from clearing the channel by the constant activity of these aviators, who daily and nightly dropped tons of explosives on the German submarine bases.

American Airmen in France

"Aerial Age" Editor Gets Distinguished Service Cross

Washington—The Commander in Chief of the American Expeditionary Forces has awarded the Distinguished Service Cross to the following officers for the acts of extraordinary heroism described after their names:

Second Lieut R. E. Decastro, Air Service, 1st Aero Squadron, pilot.—For extraordinary heroism in action near St. Mihiel, on September 12th. Because of intense aerial activity on the opening day of the St. Mihiel offensive. Lieutenant Decastro, pilot, and First Lieutenant A. E. Esterbrook, observer, volunteered to fly over the enemy's lines on a photographic mission, without the usual protection of accompanying battle planes. Notwithstanding the low-hanging clouds, which necessitated operation at an altitude of only 400 meters, they penetrated four kilometers beyond the German lines. Attacked by four enemy machines, they fought their foes, completed their photographic mission, and returned safely.

First Lieutenant A. E. Esterbrook, Air Service, observer, 1st Aero Squadron.—For extraordinary heroism in action near St. Mihiel on September 12th. Because of intense aerial activity on the opening day of the S.. Mihiel offensive, Lieutenant Esterbrook, observer, and Second Lieutenant R. F. Decastro, pilot, volunteered to fly over the enemy's lines on a photographic mission, without the usual protection of accompanying battle planes. Notwithstanding the low-hanging clouds, which necessitated operation at an altitude of only 400 meters, they penetrated four kilometers beyond the German lines. Attacked by four enemy machines, they fought off their foes, completed their photographic mission, and returned safely. Home address, Major E. P Esterbrook, father, Fort Flager, Washington.

Lieutenant Decastro was previous to his joining the Air Service, Associate Editor of Aerial Age.

First Lieutenant William P. Erwin, Air Service, 1st Squadron.—For extraordinary heroism in action in the Chateau-Thierry and St. Mihiel salients, France. Lieutenant Erwin, with Second Lieutenant Byrne E. Baucom, observer, by a long period of faithful and heroic operations set an inspiring example of courage and devotion to duty to his entire squadron. Throughout the Chateau-Thierry actions in June and July he flew up under the worst weather conditions and successfully carried out his missions in the face of heavy odds. In the St. Mihiel sector September 12-15, he repeated his previous courageous work. He flew as low as fifty feet from the ground behind the enemy's lines, harrassing German troops with machine-gun fire and subjecting himself to attack from ground batteries, machine guns and rifles. He twice drove off enemy planes which were attempting to destroy an American observation balloon. On September 12-13 he flew at extremely low altitudes and carried out infantry contact patrols successfully. Again on September 12th, he attacked a German battery, forced the crew to abandon it, shot off his horse a German officer who was trying to escape, drove the cannoneers to their dugouts, and kept them there until the infantry could come up and capture them.

120 American Planes Bomb Moving Troops

With the American Army, Northwest of Verdun (Associated Press).—American bombing aeroplanes and aerial machine gunners were busy on October 23rd in checking German troop movements towards the fighting front. At midday two squadrons of bombers attacked Buzancy with excellent results. Later about 120 machines attacked enemy troop concentrations in the woods in the region of Remonville.

Several formations of Fokkers attacked both groups of the American bombers, but were driven off in each instance.

Lieutenant Edward V. Rickenbacher was credited with one boche before breakfast.

Other reports of air victories continued to reach the officials all day. At least twelve German machines were brought down.

Lieutenant Sidney Grant of Orange, N. J., observer, and Lieutenant F. B. Foster of Boston, Mass., pilot reported two Boche machines as their morning's work, returning to thei own lines with twenty-three bullet holes in their wings as evidence of the fight.

Three Fly from Texas to Capital Despite Storms

After battling storms, heavy rains, and smoke from forest fires, three young army aviators are safe in Washington with the coveted honor of being the first men ever to fly from Texas to the national capital.

They flew the 1,700 miles in a total flying time of a trifle less than thirty hours, an average speed of about fifty-six and two-thirds miles an hour.

The holders of this new air record are Lieutenants W. P. Bancker, Jr., Z. P. Lee and C. M. Cone. Flying in two training planes, they left Ellington Field, Houston, Tex., on October 17, and from then until they "taxied" their planes safely on the ground of Washington they were almost constantly in bad weather.

Their longest single flight was from Indianapolis to Delaware, Ind., a distance of 170 miles, which they covered in exactly two hours. The longest day's flight was 350 miles, from Dexter, Mo., to Indianapolis.

While on the way up they aided local Liberty Loan committees in towns and cities in Texas, Arkansas, Missouri and Ohio, dropping Liberty Loan literature and attending patriotic rallies.

On October 22 they flew from Dayton, Ohio, to Washington, Pa., then, as Lieutenant Bancker said, "We flew from Washington to Washington." They landed at Bolling Field, Anacostia, at 6 o'clock on October 23.

"Our trip was uneventful except for bad weather," said one of the officers. "While on the way north from Memphis, Tenn., we ran into the smoke from those forest fires in Minnesota. This bothered us, so that we had to make a detour of about one hundred miles to avoid it.

"On the way we stopped at six of the army flying fields.

"Our flight from Texas to this city proves beyond doubt that the training planes used by the army are capable of long, sustained flights under bad weather conditions."

Our Fliers Down 15 Planes

Washington.—Continued progress by the Americans on the battlefront north of Verdun was reported on October 24 by General Pershing.

Fifteen enemy aeroplanes and one observation balloon were shot down in the course of many combats, in which three American balloons were destroyed and six planes failed to return.

The Bristol fighter used by Captain R. W. Schroeder in his world's record altitude flight at the Wilbur Wright Aviation Field, equipped with Hispano-Suiza motor

Le Matin on Airnats

Le Matin, the leading daily journal in Paris, during the week commented on the new nickname for the men of the Air Service. It read in part:

"Airnats, a clear, nice and neat word. That is the surname adopted by the flying corps of the United States Army.

"This choice was made recently through a competition organized by the *Plane News* after a very laborious balloting.

"A prize of one hundred francs was to be given to the best choice of a name and there were several tempting titles on the list: Sky Jockies, Eagles, Larks, Skyscrapers, etc. Airnats, submitted by Swafford of the 665th Aero Squadron, had the majority of votes and was finally adopted.

"The word does not mean much by itself, being an abbreviation of Aeronauts, but it is really lively, and our friends intend that Kaiser Bill will soon hear about it at his expense.

"Airnats, Doughboys and Rednecks are all animated by a strong resolution: get plain victory, because they know that they must make the world a place where anyone can live."—*Plane News.*

7,000,000 Soldiers' Letters Distributed Rapidly in United States

More than 7,000,000 letters from American soldiers were received at Atlantic ports between July 29th and August 9th, and the Postoffice Department announces that every one of them was started for its destination within twenty-four hours after its arrival.

One ship, it is stated, brought 2,823,000 letters and another 300,000 on August 2, and a ship arriving August 5 brought 2,031,000.

Of all this mail, the department said, 80 per cent was sorted as to railroad routes in America before it left France.—*Plane News.*

More Boche Bow to Fonck

Lieut. Fonck, the French ace of aces, has scored two more air victories, which raises his total to 62. He has an unofficial total of 92 victories. The recent victories of the greatest of all aces was a double victory, he attacking two enemy planes, getting both.

Paint Iron Crosses Over Bullet Holes

American pilots in defiance of the Hun "lead" are painting small iron crosses over holes made in their wings by German bullets. Planes of some of the American aces are covered with the ugly black signs, however the crosses are greatly overshadowed by the radiant American insignias expressing the fliers' faith.—*Plane News.*

137 Aeros Felled by American Unit

With the American Army on the Lorraine Front.—"The American flying circus" is the nickname by which the most notable American aviation pursuit group will be known in the future, after having enhanced its record notably during the St. Mihiel offensive.

This group consisting of several pursuit squadrons, is the oldest in the service. It did inestimable work in the Marne fighting, and it may be said to have fully established its claim to the title by 34 clean-cut victories with minimum losses during the past ten days.

One hundred and thirty-seven officially confirmed victories had been credited to the group with seventeen more confirmations under way and perhaps twice as many victories achieved but not countable officially because of the strict American and French method of reckoning as victories only those planes and balloons seen to have been destroyed by witnesses other than the aviators taking part in their destruction.

D'Annunzio Wins High Decoration

Italian Headquarters in the Field.—King Victor Emmanuel on Sept. 20th presented to Major Gabriele d'Annunzio, as the head of the airmen who made the raid on Vienna, the high decoration of an officer of the military order of Savoy. A dozen British fliers on this front received the Italian silver medal for valor.

After the ceremony there was the largest review that has ever been held of the Italian Flying Corps; certainly one of the most striking spectacles seen anywhere since flights became practical. The pilots' skill and mastery of their machines were such that they played all sorts of tricks above and all around the royal party, which included the Prince of Wales, the Duke of Aosta, the Count of Turin, General Diaz and all the Italian General Staff.

From Resnati's Father

The youthful soldier of the United States of America, strong and beautiful, is today on the fields of glorious France rushing to victory, and today, in the name of human honor and liberty, he enters the glorious trenches of Italy, once more and forever vindicated.

Silvio Resnati, who is now dead, thus dreamed when alive.

Let us, sir, keep this alive within us, so that the end of the war may find Latin geniality bound to the bold, bounding, free energy of America—for thus he had often written me from that land which he loved as his second country. The soul of Silvio Resnati will exult in the mutual benefits, in the grandeur of our countries, and in the radiant triumph of a peace wrought from the love of humanity. He was not only a daring, yet modest, scientist of the air, but also a well-poised thinker, an uncompromising wisher for the intimate union of our two peoples.

You wished him well, both for himself and for the beautiful Italy which he was representing, just as he wished well all the American people, who intuitively understood him and felt that he was theirs, entirely theirs.

Say to your fellow-countrymen all the expressions of thanks which his mother, his sisters, his aviator brother, brave but unfortunate, which his father—all overwhelmed but infinitely proud—have not the words to utter, nor having could utter them.

DR. LUIGI RESNATI.

Milan, Aug. 13, 1918.—New York *Times.*

Emerson Field, a new Air Service flying field at Jackson, S. C., was opened on August 1. It is named in memory of Lieut. William Emerson, Field Artillery, who was the first artillery officer killed while serving with an American aero squadron at the front.

The field, which was authorized on May 2, is to operate in conjunction with artillery, and for this purpose includes both aeroplanes and balloons. *Taylor Field Propeller.*

D'Annunzio Flies Across the Alps

Paris.—Gabriele d'Annunzio, the Italian author-aviator, landed in France on September 26 from an aeroplane in which he had flown from Italy across the Alps. He had flown 290 miles.

Capt. d'Annunzio left Turin at 9 o'clock on September 26 and arrived at Chalons, behind the French front, about noon. He made the passage of the Alps quickly, although the conditions among the mountain air currents were unfavorable. He used the same machine with which he had flown over Vienna last August dropping propaganda pamphlets, and the same pilot, Capt. Palli, guided the machine.

D'Annunzio, after landing at Chalons, joined Gen. Albricci, commanding the Italians on the French front.

Named for Downing Foes

With the American Army in France.—A large number of American aviators have received official credit for having brought down one German machine each.

Among them are Major Kenneth Marr of San Francisco, Lieut. Quentin Roosevelt of New York; Capt. Herbert Hall of Palo Alto, Cal.; Lieut. Alexander H. McLanahan of Philadelphia, E. X. Rucker of Fayette, Mo.; Waldon Heinrichs of Granville, O.; Tyler O. Bronson of New York City, Cleveland McDermott of Syracuse, N. Y.; Kenneth Porter of Dowagiac, Mich.; Robert C. Cates, Jr., of Spartansburg, Penn.; William E. Brotherton of Guthrie, Ill.; and Hamilton Coolidge of Boston.

Members of the National Advisory Committee on Aeronautics. From left to right: Messrs. John R. Freeman, C. E.; Charles F. Marvin, M. E.; S. W. Stratton, Sc.D.; Charles D. Walcott, Sc.D.; Rear Admiral D. W. Taylor, U. S. N.; Joseph S. Ames, Ph.S.; Lieutenant-Commander J. H. Towers, U. S. N.

Denver to Have Aerial Mail

The Postmaster General on October 21st in the following telegram to Senator John F. Shafroth of Colorado announced the decision of the department to extend the aerial mail service, after the war, to Denver:

"Referring to conferences with me relative to extension aerial mail service to Colorado points, I have directed the extension immediately after war of aerial mail service to Denver in connection with the transcontinental route from New York to San Francisco. I will take up matter of further extension of service in your state upon your return to Washington."

While the general extension of the aerial mail service, outside of the Washington-New York route now in operation and the New York-Chicago route to be inaugurated this winter, is being held in abeyance until the termination of the war, the Postmaster General is giving some time to the laying out of important trunk lines which will act as feeders to the chief east and west line that will run from New York to San Francisco. The telegram to Senator Shafroth announces the decision reached to extend the service into the State of Colorado, which has been discussed for some time between Senator Shafroth and the Postmaster General.

Aero Mail Pilot Eats Lunch En Route

William Dishler Warner, the inventor of the Warner Knee Control, has received an immensely interesting letter from Pilot Robert F. Shanle, of the New York-Philadelphia-Washington aero mail service. It follows:

"Mr. Charles King, chief mechanic of this field, equipped the planes I fly in the New York-Philadelphia-Washington air mail service with the 'Warner Knee Control.'

"The Warner control allows me the free use of both hands, and as schedule leaving time is twelve noon every day, I now take my lunch with me and eat it while en route.

"I consider the knee control a great advantage to cross-country fliers."

The French Aerial Mail

The Paris correspondent of the *Daily Telegraph* writes on August 18:

A postal service by air has been started for the first time in France between Paris and St. Nazaire, Aeroplanes, carrying mails, left Le Bourget Aerodrome, near Paris, shortly after ten, and one of the two machines, the other having had an accident, reached St. Nazaire at 8:30 p.m., after a stoppage at Le Mans.

SCHEDULE OF AEROPLANES. NEW YORK-WASHINGTON ROUTE AND CLOSE TRAIN CONNECTIONS THAT ARE BEING MADE

Leave New York 12.00 noon
Arrive Philadelphia 1.30 p. m.
Arrive Washington 3.30 p. m.

Tr. 7, Phila. & Read. R.R.—For post offices between Philadelphia and Williamsport, Pa.

Tr. 13-17, Atlantic City R.R.—For post offices between Camden and Atlantic City, N. J.

Tr. 463, N. Y., Phila. & Norf. R.R. and tr. 423 Penn. R.R.—For all post offices in Delaware.

Tr. 627, Penn. R.R.—For post offices between Philadelphia and Harrisburg, Pa.

Tr. 21, Penn. R.R.—For post offices in Pennsylvania west of Harrisburg, Pa., and for West and Southwest States

Trs. 1477-1279, West Jersey & Sea Shore R.R.—For post offices between Camden and Millville, N. J.

Tr. 1113, West Jersey & Sea Shore R.R.—For post offices between Camden and Cape May, N. J.

Tr. 4543, Penn. R.R.—For post offices between Philadelphia, Pa., and Perryville, Md.

Tr. 570, Phila. & Read. R.R.—For post offices between Philadelphia, Pa., and Boundbrook Junction, N. J.

Tr. 372, D. L. & W. R.R.—For post offices between Philadelphia and Stroudsburg, Pa.

Mails arriving at Washington by aeroplane at 3.30 p. m. will make connection with train 1, B. & O. R.R., leaving Washington at 4.00 p. m., serving post offices between Washington and St. Louis, Mo., and train 21, Southern R.R. for post offices between Washington and Harrisonburg, Va.

Leave Washington 11.30 a. m.
Arrive Philadelphia 1.30 p. m.
Arrive New York 3.30 p. m.

The same connections will be made at Philadelphia northbound as are destribed above for connection with the southbound aeroplane, and the following connections will be made at New York:

Tr. 26, N. Y., N. H. & H. R.R.—For post offices between New Haven, Conn., and Boston, Mass., leaving New York 5.11 p. m.

Tr. 19, N. Y. C. R.R.—For post offices in Vermont, Massachusetts, Northern New York, Canada and States west and northwest, leaving New York 5.31 p. m.

Tr. 288, N. Y., N. H. & H. R. R.—For post offices between New York and New Haven, Conn., leaving New York 5.30 p. m.

Tr. 183, Erie R.R.—For post offices between Jersey City, N. J., and Middletown, N. Y.

Tr. 26, Long Island R.R.—For post offices between Jamaica and Montauk, N. Y.

Tr. 214, Long Island R.R.—For post offices between Jamaica and Greenport, N. Y.

In order to make the connections at New York above enumeraied by railroad, the mail would have to be despatched from Washington by Pennsylvania tr. 118, leaving at 11.00 a. m., arriving at Philadelphia at 2.20 p. m., and arriving at New York 4.45 p. m.

This schedule would also make the last afternoon delivery over the entire city of New York, while it would be necessary to despatch mail from Washington by train 114, leaving at 9.00 a. m., to make the same delivery.

THOMAS G. PATTEN, *Postmaster.*

The aero mail planes, which carried Douglas Fairbanks, the "movie" star, as first class mail matter, from Washington to New York. The result of the trip was that "Dougie" was able to sell several million dollars worth of Liberty Bonds

The AIRCRAFT TRADE REVIEW

Munitions Patent Board Established

For the purpose of co-ordinating the policies of the War Department and the Navy Department in patent matters, the Secretary of War and the Secretary of the Navy have established the Munitions Patent Board. The membership of this board consists of the Hon. Thomas Ewing, who has been jointly selected by the Secretary of War and the Secretary of the Navy; Max Thelen, the representative of the War Department, and Pickens Neagle, representing the Navy Department.

The Munitions Patent Board has been formed to consider clauses in contracts of the respective departments dealing with patents; questions as to the validity or infringement of patents and the patentability of inventions; questions as to the amount of compensation to be paid for patents or for the use of patents; and all other miscellaneous questions as to patents which may arise in the two departements interested. The board is empowered to recommend, from time to time, to the Secretary of War and the Secretary of the Navy, suitable action to be taken or policies to be adopted in regard to all patent matters which are brought before it for consideration. The action of the board in matters which come before it in so far as they apply to the War Department is subject to the final approval of the Secretary of War, and in matters for the Navy is subject to the final approval of the Secretary of the Navy.

Archibald Black Goes to Navy Department

Mr. Archibald Black, recently aeronautical engineer of the L-W-F Engineering Company, College Point, N. Y., has accepted an appointment as aeronautical engineer with the Bureau of Construction and Repair, Navy Department, Washington, D. C., and began his duties there October 21st, 1918.

Mr. Black was born in Scotland thirty years ago. After some years in the electrical line there he came to America, just at the time when flying was in its infancy. His interest in aviation dates back a decade and the optimism he has held for its future during these years has spurred him on to study and keep in close touch with the business.

After coming to this country, Mr. Black remained in his old line, working for the New York Edison Company, Detroit Edison Company and other electrical concerns. Early in 1916 he took a position in the engineering department of the Curtiss Aeroplane Company in Buffalo where he remained until coming with the L-W-F Engineering Company in August, 1916. Various L-W-F machines have been built under Mr. Black's direction, noteworthy among which was Model F in which was installed the first Liberty Motor to fly.

American Bronze Makes Changes

Berwyn, Pa.—The American Bronze Company has made a number of changes in its organization. Matthew C. Dittman, vice-president and treasurer, has been appointed general manager, and C. H. Baker, formerly auditor of the Timken Roller Bearing Company, Canton, will be his assistant. E. G. Anderson, sales manager, has been appointed advertising manager.

Detroit Priorities Office Opened

Detroit—A priorities section of the production division of the Army Ordinance has been established in Detroit under the direction of F. J. B. Sevald. Heretofore it was necessary for Michigan manufacturers to apply for priorities to Chicago.

Watson Heads Hispano-Suiza Section

Washington—John W. Watson, president of the American Bronze Company, Berwyn, Pa., has been appointed assistant chief of the Hispano-Suiza engine section of the Aircraft Production Board, of which B. D. Gray is chief. Mr. Watson will make his headquarters in New York.

Oakland Gets Bugatti Cylinder Order

Pontiac, Mich.—The Oakland Motor Car Company has been asked to supply the United States Government with cylinders for the Italian Bugatti 16-cylinder engine. Production on this contract is to start at once in the former Northway motor plant.

Limit Imports of Varnish Gums

Washington—Hereafter varnish gums can only be imported into the United States if they have been shipped from abroad prior to October 10th, 1918, if for use by the United States Government, if from Mexico or Canada, if as returned cargo from Europe or Mediterranean Africa when the loading can be done without delay, if Manila gum from the Philippine Islands and if Kauri gum not to exceed 3,000,000 lbs. for the present calendar year. Varnish gums other than the above are banned for importation.

License Pyrites from Spain

Washington—The War Trade Board will authorize licenses for the importation of 56,400 tons of pyrites from Spain for the remainder of the calendar year. Original regulations restricted imports of 125,000 tons up to October 1, 1918, but since licenses have not been issued for the full amount the Board has arranged to allow the 56,400 tons to enter during the last months of the year.

Sweeney Goes to Firestone

Detroit—J. B. Sweeney, formerly assistant advertising manager of the Paige-Detroit Motor Car Company, has joined the advertising department of the Firestone Tire & Rubber Company, Akron.

Personal Pars

S. V. Norton, manager of the truck tire sales of the B. F. Goodrich Company, Akron, is one of the several men to whom Gov. Cox of Ohio has assigned the task of working out a plan that will accelerate the development of motor truck transportation.

C. T. Schaefer, formerly chief engineer of the Globe Motor Truck Company, is now chief engineer of the Anvac Manufacturing Company, Anderson, Ind.

Castor Beans to be Threshed this Month

The 5,000 acres of castor beans planted by the Chamber of Commerce will be threshed the latter part of the month. Machines for the threshing are now in storage at the warehouse. Three machines will be attached to one engine. It has been impossible to estimate the crop. The drought has made it considerably less than was expected, but as some of the seeds were planted in irrigated land the total crop will be large.

When the total crop has been cut by the farmers it will be brought to San Antonio and threshed. It will then be sold to the Government at cost and the oil will be used to run aeroplanes.

The Chamber of Commerce accepted the Government contract for the castor beans and are doing the whole work on a patriotic basis without profit. Farmers under Government contract are given 50 cents per bushel in other parts of the country. The Chamber of Commerce took the contract for this portion of the country.

Leaflets from Plane

Workmen at Camp Meade were "bombed" by an aeroplane, 18,000 leaflets containing cheery messages being showered down upon them from a plane which left Bolling Field at 11:25 o'clock on October 24.

This was the first "bombing" plane sent out by the construction division of the army in its campaign to disseminate messages among workmen at the national cantonments.

The first plane was driven by Lieutenant E. B. Chandler. Lieutenant W. H. Lamprechter of the construction division threw down the messages.

"The quick finish of this job here will help Uncle Sam finish the kaiser over there," read one of the leaflets.

An interior view of part of the famous Pomilio aircraft factory in Italy

One of the many remarkable formation flights at the Belmont Park Aviation Carnival

LARGEST FORMATION FLIGHT AT MARCH FIELD

IRREFUTABLE proof that America has taken her rightful place in aviation was demonstrated to the people of Los Angeles and Southern California Saturday, October 12th, when 103 American-made aeroplanes, piloted by officers and cadets from March Field, flying in battle formation, the largest aero fleet ever to have been assembled in one flight in this country, bombed that neighboring city with Liberty Loan literature.

With Major John C. P. Bartholf, J.M.A., Commanding Officer of March Field at the peak; Major Ernest Clark on the right wing and Capt. Wm. Alden Smith, Jr., on the left wing, this gigantic formation taxied off, circled the course, assembled in ten separate and distinct units and finally headed in one solid formation for Los Angeles, 60 miles distant. The one hundred three (103) planes got into the air in a period of six minutes. The course followed the Foothill Boulevard, the planes maintaining an altitude of from 3,000 to 6,000 feet. Landing was made at El Segundo, just 78 minutes after leaving March Field.

The Arcadia Balloon School was advised by wireless of the approaching squadron and two ships were sent out to escort the formation over the city. A realistic battle-front feature of the flight was accomplished when this gigantic air fleet passed over the balloon school, seven huge observation balloons having been in the air at the time. The planes at this point were traveling at about the level of the Mount Wilson Observatory.

While thousands of persons craned their necks to get a glimpse of this great American armada the planes suddenly swept down from the mountain peaks giving Los Angeles a realistic imitation of a real air raid. Bombs were dropped and from them fell leaflets saying: "What if we were Germans? Buy Liberty Bonds." Copies of the camp newspaper, *The March Field Fly Leaf*, were also dropped from the planes.

Accompanying the air fleet was a hospital ship with Capt. M. Bannister, flight surgeon, as the passenger. Still another plane carried an official photographer, representing the Ince studios of Los Angeles. Moving pictures of the entire trip were taken both from the ground and en route. The films are to be sent to Washington.

All of the planes on this remarkable flight were of the Curtiss JN-4D training type. The ships returned in formations of 10, several of the units returning to March Field by more distant routes after visiting numerous Southern California towns and cities in the interest of the Liberty Loan.

Never before has such a flight been attempted in this country. Previous to this great air adventure the largest number of planes visiting an American city was 68, when in formation under the command of Lieut. Col. C. K. Rhinehardt, J.M.A., members of the First Provisional Wing of the American Air Service, flew over New York City. The more credit, however, is due the March Field squadron in that half of the pilots participating in this remarkable journey were cadets, pilots in training, while the remaining pilots other than unit leaders, were for the most part flying officers who have been commissioned at this field since July.

With but one exception, all of the planes to leave March Field returned on scheduled time, this feat in itself being a remarkable record, the entire trip devoid of accidents. Lieut. Ralph Watson made a forced landing in the outskirts of Los Angeles when his motor "froze" in the air. He landed in a beet field at Sixtieth and Budlong Streets. No damage.

Particular credit is due the Engineering Department on account of the fact that thirty of the ships were using motors which had had more than one hundred hours' service in the air since their last overhaul.

The highest commendation is due Major Bartholf, Commanding Officer; Major Eglin and Major Clark, officers in charge of flying; Capt. Wm. Alden Smith, Jr., Adjutant, and the numerous lieutenants who acted as unit leaders, as well as each individual pilot who made possible this air journey without a mishap to aviators or machines.

Major Bartholf summarized the significance of the achievement in his message of thanks to his command, which read as follows:

Memorandum: To All Concerned:

The Commanding Officer desires to express to the entire personnel of this Command, his appreciation of the very high degree of efficiency and entire cooperation which made possible

(*Continued on page* 421)

RADICAL INCREASE IN BALLOON CORPS

Veteran Balloonists and Observers to Help Colonel Fuller Organize and Instruct New Units

ACCORDING to recent orders the balloon corps is to be immediately increased to approximately four times its original size.

The American balloon companies have rendered unusually efficient service in France and there is a constantly increasing demand for observation balloons.

The original allowance of balloon troops is nearly all serving abroad, leaving only a small percentage of the old staff of experts available for training the new officers and soldiers.

The balloon training service has been placed under the supervision of Colonel A. L. Fuller, originally of the Coast Artillery Corps, who was the founder of the mechanics' school and the Ground Officers' School at Kelly Field.

In the Washington office he will be assisted by Majors R. S. Bamberger, E. Lazar and J. C. McCoy, also by Mr. Frank P. Lahm, the veteran balloonist. In addition the following younger graduates of the balloon schools will assist:

Captain C. E. Smythe, Captain A. Grimm, 1st Lieut. C. J. Schiller, 1st Lieut. W. D. Simpson, 1st Lieut. C. W. Merrell, 1st Lieut. R. S. McCullough.

Colonel J. Prentice, pioneer observer, who has recently recovered from a serious balloon accident of a year ago, is temporarily on duty at Washington. Lieut. Colonel H. B. Hersey and Major Harry R. Vaughn, have also been temporarily in Washington for consultation.

In order to fill the great number of vacancies created for officers, authority has been granted to transfer from the other branches of the army and to induct draftees. It will be necessary to enlist about twenty-five thousand soldiers. Induction of men subject to the draft has been authorized.

The balloon service can use a great variety of skilled tradesmen. Automobile, rope, rubber fabric and telephone experts are the most urgently needed.

Opportunities to rise from the ranks are as good, if not better, in the balloon corps than in any other branch of the service.

Persons interested in the balloon service should promptly visit or address the aviation boards whose addresses are as follows:

Boston, Mass.—739 Boylston St.
Canal Zone—Fort Sherman.
Chicago, Ill.—230 East Ohio St.
Dallas, Texas—Camp Dick.
Fort Sill, Okla.—Post Field.
New York City—104 Broad St.
Columbia, S. C.—Camp Jackson.
Yaphank, L. I., N. Y.—Camp Upton.
Little Rock, Ark.—Camp Pike.
Atlanta, Ga.—Georgia School of Technology.
Los Angeles, Calif.—Marsh Strong Bldg.
Minneapolis, Minn.—University of Minnesota.
Des Moines, Iowa—Camp Dodge.
St. Louis, Mo.—525 So. Euclid Ave.
San Francisco, Calif.—55 New Montgomery St.
San Antonio, Texas—Fort Sam Houston.
Washington, D. C.—Bldg. D, 6th and Missouri Ave.

Veterans of the Balloon Corps who will help organize the unit for the increase. Left to right: Mr. Frank P. Lahm, Major J. C. McCoy, Colonel A. L. Fulton, Major Harry R. Vaughn, Colonel James Prentice, Major E. Lazaire, Colonel H. B. Hersey

Younger officers of the Balloon Staff now in Washington. From left to right: First Lieutenant C. W. Merrell, First Lieutenant R. S. McCullough, Captain C. E. Smythe, Captain A. Grim, First Lieutenant C. J. Schiller and First Lieutenant W. D. Simpson

(*Continued from page* 420)

the flight on Saturday, October 12th on such a comprehensive scale, and which allowed this flight to be characterized by absolutely unqualified success.

Any field might put a limited number of picked planes and pilots in the air for a special performance and make a creditable showing; but this cannot necessarily mean an efficient organization.

On the other hand a school that can put one hundred three (103)*—aeroplanes, eighty-five* (85%)*—per cent of its entire plane equipment, in accurate formation, piloted in large part by cadets who have not yet completed their training, throughout a flight of one hundred and sixty* (160) *miles, including a stop for gas, and absolutely without damage to any plane, must necessarily have an efficient organization and efficient personnel throughout every department.*

A closer inspection of the circumstances attending this flight show: the depleted condition of all squadrons, the fact that this flight was made without any interference of the regular training duties, the fact that twenty (20%) *per cent of the aeroplane equipment was second hand and received in unserviceable condition, the total flying time of approximately* 20,000 *hours without a fatality and without the loss of a single ship from the total received at this field; all of which make this performance all the more remarkable and a performance of which every member of this command may feel justly proud as a record that has never been equaled at any of the forty flying fields in the United States.*

John C. P. Bartholf.

PREPARING THE PILOT FOR BATTLE ACROBACY OR TRICK FLYING

The Chassé Flyer Must Master Every Rudiment Before Being Fit to Combat With Enemy

By K. G. PULLIAM, Jr.
Captain, J. M. A., S. C., U. S. A.

(NOTE:—The article printed herewith was written at the request and by authority of Air Service Headquarters, A. E. F., and is considered probably the most complete and comprehensive treatise on acrobacy yet published.)

ACROBACY or trick flying is as necessary to the fighter of the air as a knowledge of his gun mechanism is to the infantryman. Consequently such trick flying has been found necessary to prepare a flyer for combat is now taught in the training schools.

It is extremely necessary that every chasse pilot master the rudiments of acrobacy before he tries air combat, for in such combat he must necessarily forget that he is flying and must devote every faculty to keeping out of the line of fire of his adversary. In thus dodging his enemy's attack the pilot puts his machine into positions which, due to inexperience, result in a vrille or in an upside-down position, and unless he has been taught how to avoid such positions he places himself open to being shot down by his adversary.

The object of acrobacy is to produce each dangerous condition of flight that a pilot may be expected to encounter and to teach how to meet them. Only in this way is it possible for a pilot to become the master of his machine. Thus in a short period devoted to intentional acrobacy a pilot acquires the confidence in his ability to meet all emergencies that no amount of ordinary flying can produce, and as a result he finds it possible to devote his entire time to his work of warfare, the function of piloting being performed instinctively.

At a field where trick flying is taught every student is given individual attention and instruction. Only one "stunt" at a time is explained, which must be repeated by the student, and unless every movement is thoroughly understood he is not permitted to attempt the work.

The Vrille

And so many accidents are attributed to the vrille and since it is considered the most disconcerting of all stunts it is the first to be taught. Any badly executed stunt or loss of speed may result in the machine doing a skid or a wing slip with probably a resultant vrille.

In starting the pilot ascends to at least 1,200 metres and after flying level for several minutes throttles his motor and just at the point where the machine stalls he pulls the control stick quickly back toward him and at the same time to the side, accompanying it by a sudden push of the rudder bar, using the foot corresponding to the side on which the stick is placed.

As a result the machine shoots suddenly up, losing speed, and falls sharply over to the side with a twisting corkscrew-like movement. In every case the twist commences sharply and the student is instructed to place his controls in neutral after the machine has made several turns and to *slowly* push the control stick forward a few inches. The machine ceases its whirl, points forward and dives straight down, the pilot at once redressing his control stick and bringing his machine again to horizontal flight, at the same time switching on the motor.

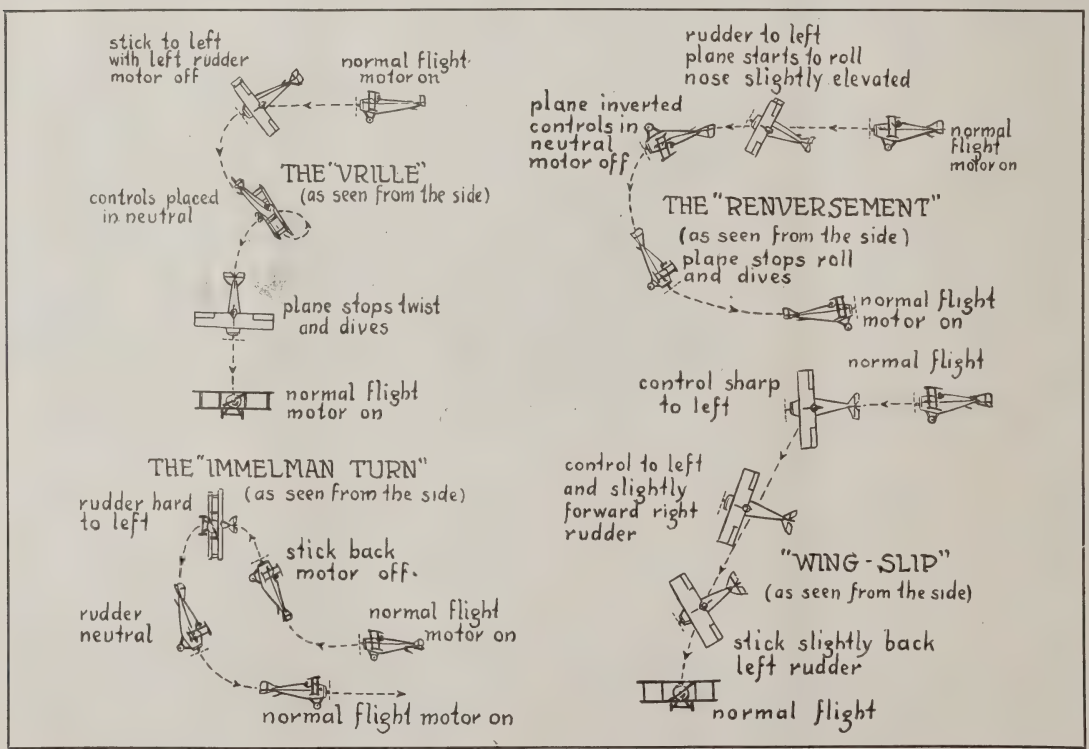
The pupil is instructed in both right and left hand vrilles, the instructor watching closely every movement made, and when the pilot lands he is told the mistakes he has made.

A vrille can be made with controls deliberately crossed, i. e., right hand rudder with stick to left or left rudder and right hand stick. The effect is the same, though somewhat harder on the machine, as the spin is not so quick and a twisting movement is produced in the fuselage. This crossing of controls is not encouraged, as in recovery the motions are opposite and likely to cause confusion, frequently the pilot redressing too much with the result that the machine goes into a spin on the opposite side.

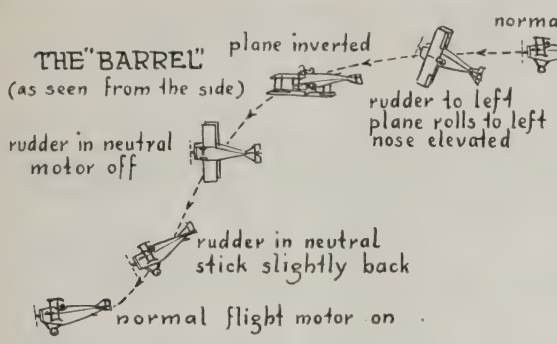
The Renversement

Although the use of the renversement in actual combat is questionable, it is nevertheless very necessary that the student thoroughly acquaint himself with this stunt, as any pilot who is familiar with the movements of the renversement will be able to control his machine whether or not he is in an upside-down position.

To perform the renversement the pilot ascends to the height of 1,200 metres, flies for a few minutes, then points the machine *very* slightly downward so as to bring the speed up to maximum, pulls the control stick back sufficient to raise the nose of the machine to an angle of 20 or 30 degrees. If a left hand renversement is desired the rudder should be pushed hard to the left. As a result of the above control motions the nose of the machine jerks sharply upward, followed by a roll of the entire machine to the left. Just before the machine is completely on its back the motor is cut and the pilot places his controls in neutral; the plane stops its roll and the pilot pulls back on the control stick, causing the machine to dive and almost at once resume the horizontal, at which time the motor is switched on, the stick placed in neutral and normal flight resumed.



Since the pupil being unfamiliar with the head-down position in which he hangs when the machine is on its back, is not likely to recognize the moment at which the controls should be placed in neutral, he is instructed to immediately neutralize the rudder after he has thrust the control to the left.



The renversement can be made to the right as well as to the left by use of right rudder instead of left, as described above.

The Immelman Turn

The Immelman Turn was first used in combat by Lieutenant Immelman of the German Flying Corps and has proved very useful as one of the fighting pilot's bag of tricks.

To perform the Immelman Turn the pilot again ascends to the height of 1,200 metres and after flying level for a few minutes he points the nose of the machine down very slightly and then pulls slowly back on the control stick, causing the machine to climb almost vertically. Care should be taken not to pull enough on the stick to cause

the plane to loop. The motor should be cut as soon as the machine starts to climb and as soon as excessive loss of speed is felt the rudder is pushed sharply to one side. The machine falls to the side on which the rudder is pushed and as soon as the machine reaches vertical the pilot places the rudder in neutral, switches on the motor and by pulling back on the stick resumes normal flight. A slight movement of the stick to the side corresponding to the rudder used will help the movement.

When done properly the turn is a very pretty performance and no loss of altitude results. It can be performed to either side with uniform results and after the pilot is thoroughly accustomed to the movement he may use his motor throughout the complete evolution with no loss of speed.

The Barrel

The Barrel might also be called a horizontal vrille and it is performed exactly the same as a renversement, with the exception that the controls are not placed in neutral when the machine is upside-down, but just before the machine again reaches normal line of flight. The first movements of the machine is identically the same as when in a renversement, but the roll continues until the plane has made one roll of 360 degrees, at which time the motor is switched on and normal flight resumed.

The Vertical Virage

The Vertical Virage is nothing more or less than a turn in which the plane is banked until the wings are perpendicular to the ground and the elevators are used for turning. It is used to turn quickly into the opposite direction without loss of either speed or altitude.

Flying level at full speed the necessity to turn suddenly is met by throwing the control stick to the side on which the turn is desired and accompanying it with a little corresponding rudder. When the position is reached in which the wings are perpendicular to the ground the stick should be placed in neutral and pulled hard back. The movement should be accompanied by opposite rudder sufficient to keep the nose of the machine from falling.

As a result of the above movements the machine banks sharply and as the stick is pulled back it seems to spin around, using the tip of the low wing as a pivot. As soon as the desired amount of turn has been made the pilot places his stick to the opposite side from which the machine is banked and the plane levels out and resumes normal flight.

The Side-Slip

Since the Side-Slip allows the pilot to lose an abnormal amount of altitude in proportion to the distance progressed forward, it is a very useful stunt. A pilot in making a forced landing may allow himself to overshoot his landing field and then side-slip off any surplus altitude, thus assuring his reaching the field.

In aerial combat and in dodging anti-aircraft fire it is also very useful, as it is a method of losing altitude very rapidly, and since in a side-slip the direction of motion is not directly forward it is very disconcerting to an enemy firing at the machine.

A side-slip is accomplished by pushing the control stick all the way to one side and accompanying it by sufficient pressure of the opposite foot to hold the nose of the machine up. The control stick is at the same time pushed slightly forward and the machine descends sidewise at a terrific speed.

To recover from a side-slip the control stick is placed in neutral and the rudder corresponding to the direction of the slip is pushed. As a result the machine turns and dives into the direction of the slip and by redressing the stick straight-away flight is resumed.

The Vrille Turn

The Vrille-Turn is very similar to the renversement, but, unlike the latter, it is very useful in air combat. It is performed with full motor and is a very rapid evolution.

The stick is pulled quickly all the way back and completely to the side, accompanied by a sharp kick of the rudder to the left. As a result the nose of the machine jerks up and the plane rolls to the left.

The rudder is immediately placed in neutral and the stick is brought back to the centre but held completely redressed. The neutralizing of the rudder stops the roll and as the stick is held completely reuressed the nose of the machine immediately climbs to level and normal flight is resumed. No loss of altitude results.

As the motor is used throughout the turn the motions are necessarily very rapid and rather disconcerting when first attempted, but the pupil soon becomes accustomed to the rapidity of the twist.

The Loop

The Loop is accomplished by putting the nose of the machine down slightly to obtain maximum speed and then pulling back on the control stick, slowly at first and more rapidly as the top of the loop is reached. Just after the top has been passed the motor should be cut, the machine being allowed to fall of its own momentum through the last half. When the loop is completed the stick should be placed in neutral, the motor switched on and normal flight resumed. When looping with a plane using a rotary motor some left rudder should be used at the top of the loop to prevent falling out of the loop to the right.

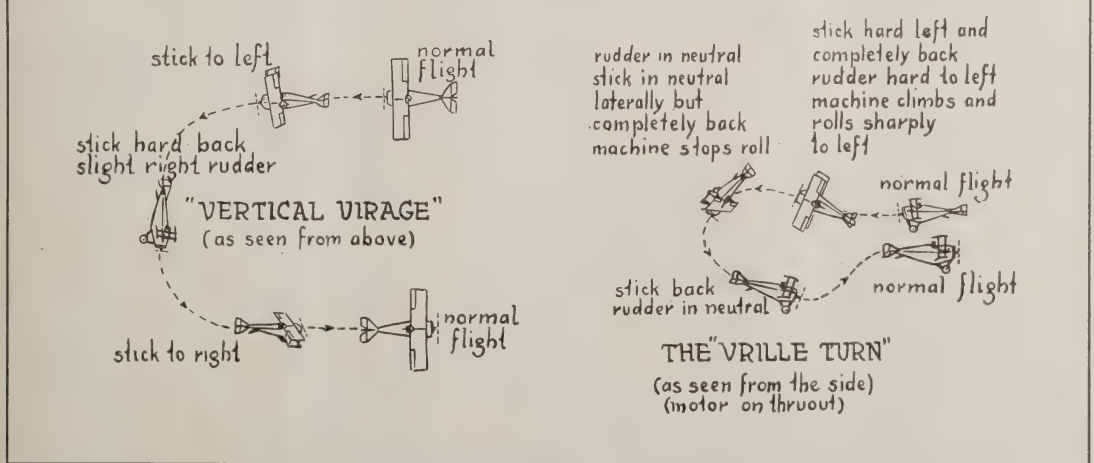
A loop improperly done may result in a vrille, and taken as a whole looping is of no value in a fight, for when a machine is inverted the pilot is quite helpless until the machine has passed the "dead point" and starts downward, thus giving an enemy who is following a good target. The machine gun belt is likely to become disarranged and cause the gun to jam.

If the loop is improperly done the reversals of pressure are very severe and are extremely hard on a finely adjusted and very fast machine, but a loop properly done causes very little strain.

The Tail-Slide

A real Tail-Slide should not be accomplished with a machine using either ailerons or wing flaps for lateral control, because when it is properly done the reversal of pressure may cause them to buckle.

A tail-slide should never be attempted by even the most experienced of pilots unless he has an especially built exhibition plane, preferably a monoplane, which is equipped with warping wings and is constructed strong enough to withstand the tremendous reversal of pressure.



A stall accompanied by a slight drop of the tail, followed by a slipping off to the side into a vrille, cannot be called a tail-slide, for a well performed tail-slide will extend for at least 300 metres.

The Time and Place for Acrobacy

Acrobacy at low altitudes is strictly forbidden at training schools and it should never be done close to the earth except in cases of emergency and actual combat.

A pilot cannot at all times be sure of the condition of the atmosphere which he cannot see and fatal falls often result when overconfidence meets with bad air conditions near the ground.

The number of expert flyers who have met their death in this manner should be a sufficient and convincing argument to any pupil in acrobacy that stunting near the ground is a game that is "not worth the candle."

THE LONDON ENEMY AIRCRAFT EXHIBIT

The Fokker Single Seater Biplane—Type D7

By G. DOUGLAS WARDROP

The British number of the machine is B/2B/14, and the German number is Type D7 F.N. 1,450; maker's No. 2,455.

It was brought down north of Hazebrouck on June 6th, 1918, by a British SE.52, and is a single-seater fighter.

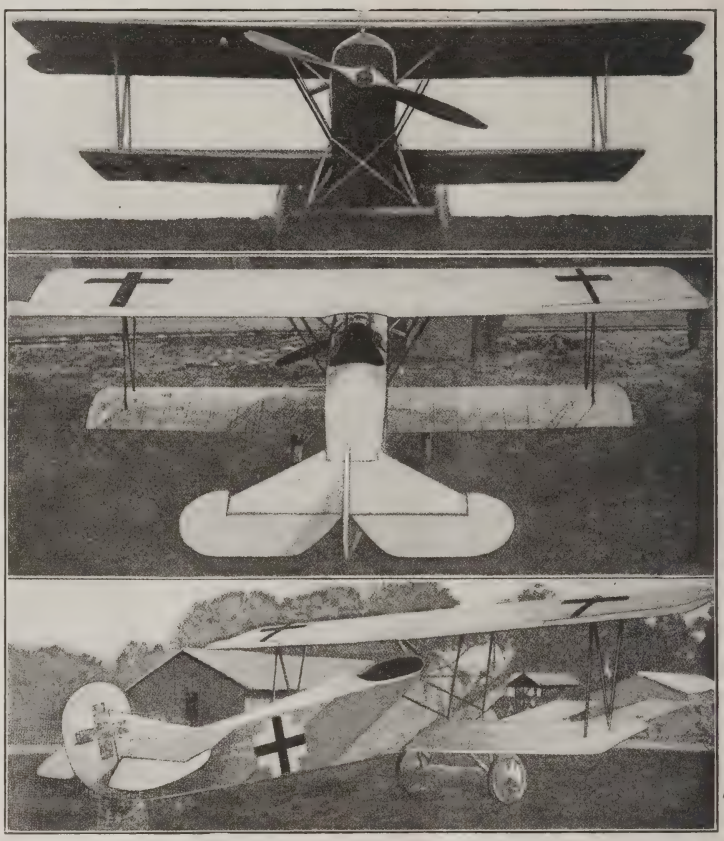
The principal dimensions are as follows:—

Span	29 ft. 3¼ ins.
Chord (upper wing)	5 ft. 2½ ins.
Chord (lower wing)	3 ft. 11¼ inc.
Overall length	22 ft. 11½ ins.
Gap	4 ft. 2 ins.
Area of upper wings (with ailerons)	140.7 sq. ft.
Area of lower wings	78.3 sq. ft.
Area of Aileron (one only)	5.7 sq. ft.
Area of aileron (one only)	5.7 sq. ft.
Area of balance of Aileron	.5 sq. ft.
Area of horizontal tail plane	21.1 sq. ft.
Area of elevators	15.2 sq. ft.
Area of balance of elevator	1.1 sq. ft.
Area of fin	2.8 sq. ft.
Area of rudder	5.9 sq. ft.
Horizontal area of body	35.6 sq. ft.
Vertical area of body	58.6 sq. ft.
Area of plane between wheels	12.4 sq. ft.

This aeroplane presents features of very great interest, whether viewed from the standpoint of aerodynamic design or of actual construction. The machine which has been the subject of investigation was, unfortunately, rather extensively damaged, thus making absolute accuracy of description difficult, and trials of performance impossible.

A similar machine, however, has been tested for performance by the French authorities, who have issued the following report:

Altitude metres	Time of climb	Speed at this height
1000 (3281 ft.)	4 mins. 15 secs.	116.6 m.p.h.
2000 (6562 ft.)	8 mins. 18 secs.	114.1 m.p.h.
3000 (9843 ft.)	13 mins. 49 secs.	109.7 m.p.h.
4000 (13124 ft.)	22 mins. 48 secs.	103.5 m.p.h.
5000 (16405 ft.)	38 mins. 5 secs.	94.9 m.p.h.



There are many points in which there is distinct divergence from accepted German, and tendency towards British, practice. The undercarriage, position of radiator and aileron control levers, or kingposts, are examples.

This fact is some indication that the designer of this machine has approached the various problems and compromises which confront one who sets out to create such a machine, with a quite open mind, and, if this be allowed, there is a very strong case for a thorough investigation of those features which are in contradiction to contemporary British practice. These points include the wing design, which is without any external bracing, but of especially deep section; the steel-tubular fuselage, and the peculiar bracing of this member.

There is nothing to prevent the adoption of the first and last features; but it should be pointed out with regard to the steel work that experienced welders have expressed the opinion that this art has been developed by the enemy to a high dgree of efficiency. Indeed, the welding is sufficiently good to give rise to the belief that new methods, involving radical changes, have been adopted.

*The following data regarding weights is taken from a French source:—

Weight of fuselage, complete with engine, etc.	1,322.2 lbs.
Weight of upper wing with ailerons	167.2 lbs.
Weight of lower wing	99.0 lbs.
Weight of fin and rudder	6.6 lbs.
Weight of fixed tail plane	17.6 lbs.
Weight of elevators	9.9 lbs.
	1,622.5 lbs.

Three views of the Fokker Single Seater

*The schedule of principal weights given on page 1204 is the result of weighing the actual components mentioned, which were taken from the aeroplane allotted G/2B/14.

A different French report gives the following figures, which are taken from inscriptions found on one of the Spandau guns on a captured Fokker of the same type:—

Weight, empty	1,540 lbs.
Permissible load (useful load and fuel)	396 lbs.

Wings

As in the Fokker triplane, the extreme depth of wing section and the absence of external bracing are distinctive features. Both upper and lower wings are without dihedral, and are in one piece. The way in which the lower wings are fitted into their place is described in detail under the heading "Fuselage." Both upper and lower chords are set parallel to the crankshaft, i.e., at no angle of incidence, and the description "Angle of incidence, 0°" is painted on the upper plane.

Wing Construction

In sharp contradistinction to the fuselage, which is constructed of steel even including members where wood is almost universally used, the wings contain no metal parts, if we exclude strut fittings and other extraneous features. There are no steel compression members, but where the internal wiring lugs occur, special box-form compression ribs are fixed. The leading edge is of very thin three-ply, which has a deeply serrated edge, finishing on the main spar. The ribs are of three-ply, and are not lightened, although holes are, of course, cut where necessary, to accommodate the control and bracing wires. A rib from the top center section, and one from the root of the lower wing, are both drawn to scale. See Fig. 1.

The extreme thinness of the three-ply has given rise to a new method of fixing the flanges on the ribs. Instead of grooved flanges tacked on so that the tacks run down the length of the three-ply, two half flanges of approximately square section are tacked together horizontally with the ply sandwiched between. See Fig. 2.

Spars

As may be seen from the various sections drawn to scale in Figs. 3 and 4, the spars are made up of fairly narrow flanges at top and bottom, joined on either side by thin three-ply webs. They are placed approximately 30 cms. apart. The flanges are made of Scots pine, and consist of two laminations. The three-ply has the two outer layers of birch and an inner ply which is probably birch also.

The three-ply webs are tacked on to the flanges, and fabric is glued over the joint. The cement is an ordinary gelatine glue.

The spar webs are glued to the flanges by a

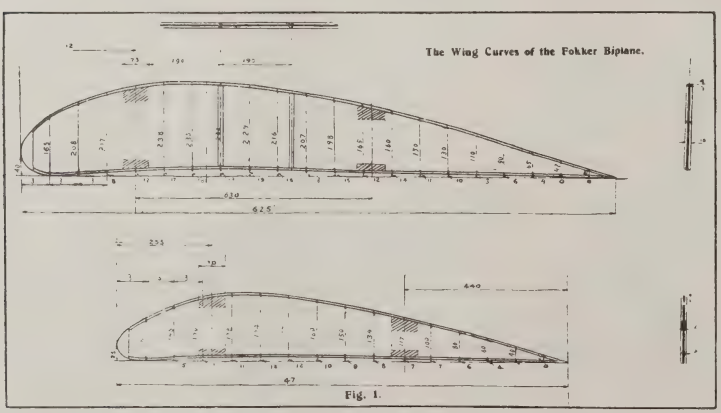


Fig. 1.

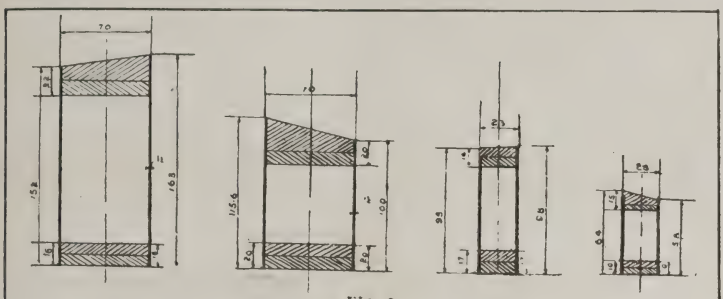

Fig. 3.

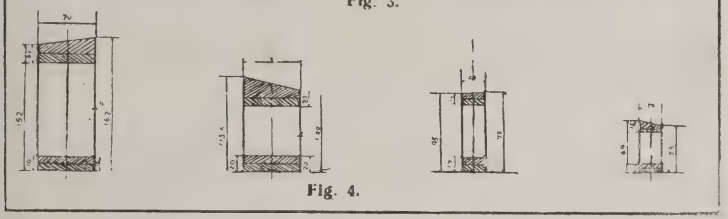

Fig. 4.

waterproof casein cement, which is proved to contain gelatine, while the plywood adhesive—also a casein cement—is waterproofed and of sufficiently good quality to withstand four hours' immersion in boiling water.

The trailing edge is of wire, and tape crosses from the top of one rib to the bottom of the next in the usual way. This tape lattice occurs about half-way between the trailing edge and the rear spar.

Fig. 3 shows the sections of the front and rear upper plane spars, taken in the centre section and at the interplane struts, while Fig. 4 gives the corresponding lower spar sections.

The ribs are stiffened between the spars by vertical pieces of wood of triangular section. There are two such pieces on each rib in the upper plane, and one in the lower plane.

All the woodwork of the wings is varnished, and fabric is bound ronnd the flanges of the ribs and glued to the top and bottom of the spars.

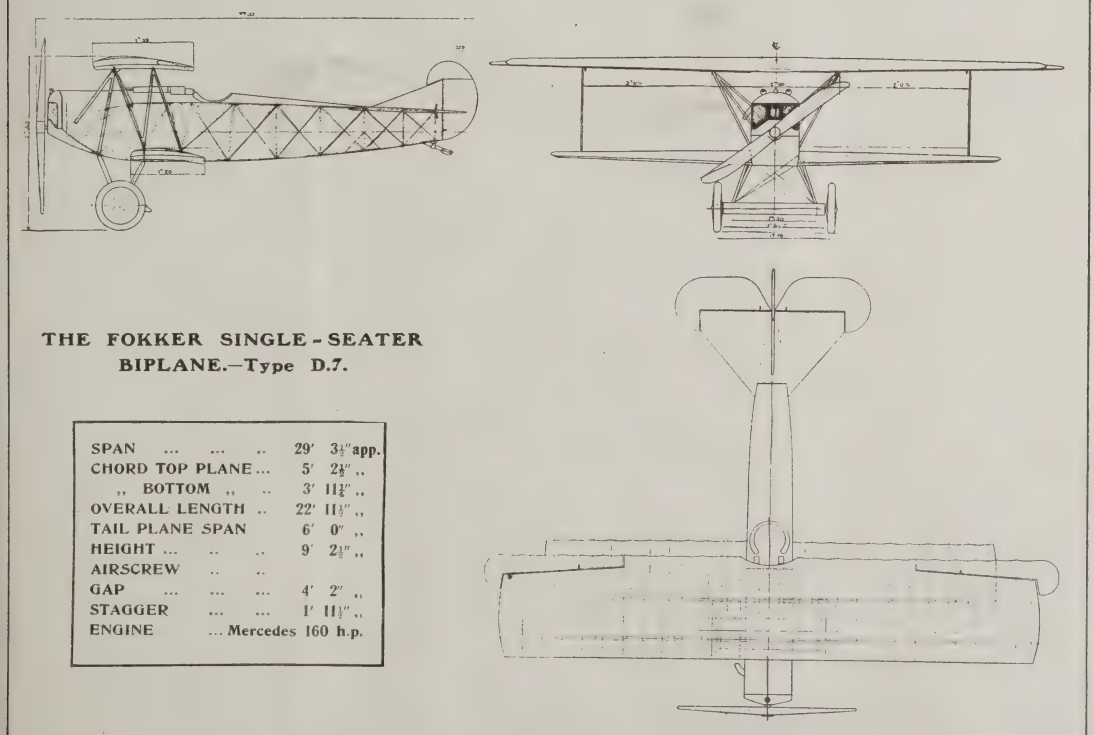
The workmanship is decidedly good, and the finish neat and careful.

Ailerons

As in the triplane, ailerons are fitted to the top wing only, and are of the same narrow shape. They are constructed of welded steel tubing. They conform to common German practice, in as much as they are fitted to a false spar well behind the rear spar, and are balanced. The welded up control lever follows British ideas, and does not work, as in most German designs, horizontally in a slot cut in the plane. All the tubing is lacquered.

Struts

The struts are all of steel tubing of streamline section, and the centre section system is particularly worthy of attention. All those three struts which meet at a point on the front spar of the upper wing are welded to the fuselage framework, and are thus not removeable when the machine is dismantled (see Fig. 5). The strut which joins the rear upper spar to the front lower spar, however, is not welded but is fastened by a ball and socket joint, which is the subject of Fig. 6. It will be noticed that the ball forms the extremity of a threaded bolt which is screwed into the end of the strut, thus making it possible to adjust the length of the latter. Both ball and socket are drilled and a bolt locked through the hole. The attachmen. of upper centre section struts to the wing spar is shown in Fig. 7.



As is made clear in the scale drawings, the interplane struts are of N shape when seen from the starboard wing tip. The three members of the N are welded together, and all four free extremities have the adjustable attachment described above. It has already been mentioned that there is no external bracing, the wing construction being made sufficiently strong against lift stresses to obviate its necessity, and the form of the interplane struts is interesting in this connection.

Fuselage

This is exactly similiar in design and construction to the triplane body—allowing of course, for the difference in type of engine and for the fact that both wings have two spars instead of one. The longerons and cross struts are of circular section steel tube welded in place, and carrying at the corner the small quadrant of steel tube which carries the bracing. The diameters of these tubes vary from 22 mms. to 18 mms., and the steel was of 24 gauge in the places where the tubes had been pierced by bullets.

This bracing well repays attention. All sides of each section are cross-braced with piano wire, which is simply passed round the two lugs to be joined and has its extremities connected by means of a turnbuckle. This method has the great advantage that only two loops are required in the wire instead of four, and in consequence this bracing can be very rapidly assembled. It is also possibly lighter in relation to its strength than the usual arrangement of single wire bracing. Fig. 8 shows how a lifting handle is clipped on to the lower longerons.

The front part of the body is a particularly good piece of welding, and includes the engine and radiator supports as well as the arrangement by which the continuous spars of the lower planes can be placed in position. This is done by removing two fork-ended tubes (one each side of the body), and replacing these when the wings are in position. Fig. 9 shows how the

wing spar is joined to the fuselage and Fig. 10 shows the fuselage joint at this point.

The cowling is of aluminum, and covers the front portion of the fuselage on all four sides. It is extended on the top to the cockpit, and underneath to beyond the rear spar. The cowls are arranged in convenient sheets, and are fastened by means of bolts and nuts of unusual shape. The nuts have small handles about 1 in. long, which enable one to manipulate them without tools. From the rear half of the cockpit to the junction of the tail and body, the top is furnished with a three-ply fairing, which extends over not quite the whole width of the fuselage. This is shown in Fig. 11.

Tail

The fixed tail planes and elevators are almost similar to those of the triplane, i.e., the tail is triangular and the elevators balanced and divided, although they are actually made in one piece. The biplane, however, has a triangular fin whose foremost point is fixed an inch or two to the port side of the centre line of the machine, thus providing a surface which is inclined slightly to the longitudinal axis of the aeroplane. This is illustrated in Fig. 12, and is no doubt arranged to balance the tendency of the machine to turn to the left in flight, due to the slipstream.

The framework of the tail is of circular section steel tubing throughout, including the trailing edges, and this framework is arranged to give the fixed tail a symmetrical camber. The attachment of the tail plane to the fuselage is simple and effective. As is the case in the triplane, the top longerons are dropped at this point sufficiently to allow the tail plane to have its top surface level with the top of the fuselage, and three bolts passing through the main steel tube of the tail and through short pieces of tube welded to the body framework secure it in this position. Of the three bolts, one is placed at either side of the top of the fuselage on the front of the tail, and one at the end of the body framework. The tail plane is set at a slight angle of incidence—about 3½ deegrees—which is not intended to be adjustable, but which could easily be altered by means of a few washers and longer bolts. The tail is stayed by two streamline section steel struts, which connect the rear tube of the tail plane with the bottom of the sternpost, as is shown by the general arrangement drawings. These struts are not barbed.

From the sketch of the tail skid (Fig. 13), it will be seen that this member is balanced at a point about one-third of its length from its lower end, and that the shock-absorbing arrangement consists of two helical steel springs.

Undercarriage

This is a feature of the machine which carries a distinct trace of British influence. The angle between the two limbs of the Vee is usually, in German aeroplanes, very obtuse; i.e., the two top points of attachment are widely separated, while British practice leans towards making this angle fairly acute. In the Fokker the angle between the struts is about 55 degrees. The section of the steel struts is streamlike in form, with major and minor axes of 65 mms. and 34 mms. recpectively. The metal is of 20 gauge.

The upper attachments of the undercarriage struts are of the ball and socket type, with a bolt through, similar to the interplane strut illustrated above. The junction of the lower extremities and the slot which allows for axle travel is clearly explained by Fig. 14. The bracing cables, which connect the upper extremities of the front struts with the opposite lower ends, are attached in the usual manner to lugs welded on to the struts. It is interesting to note that in the crash which wrecked the machine, one of these lugs has torn out a small piece of the sheet steel of which the strut is formed, though there is no sign of fracture at the weld.

The least usual characteristic of the landing carriage, however, is the provision of a small cambered plane surrounding the axle, just as is the case in the Fokker triplane. This auxiliary plane has been badly battered, and few details are available, but the sheet aluminium box which surrounds the axle remains. This box is rectangular in section, and the edges are riveted together on the upper side. It forms the main and only spar of the plane, the construction of which is very similar to that of the main plane. The shock absorbers are of the coil spring type, and are wrapped in the manner illustrated in Fig. 14. The wheels are 760x100.

Engine and Mounting

The engine is a Mercédès of 180 h.p. A full report on this type of engine has already been issued, but the present example possesses one or two minor points of difference from the standard. The chief of these is the fact that this engine has domed pistons, giving higher compression. If found sufficiently interesting, the engine will shortly be reported upon separately.

As has already been mentioned, the engine bearers are steel tubes, supported on a steel tubular structure welded up integrally with the fuselage frame and with the centre section struts. The diameter of these two parallel tubes is 34 mms. and the gauge 14. Each tube carries four "pads" of the type shown in Fig. 15, to which the crankcase is bolted.

Radiator

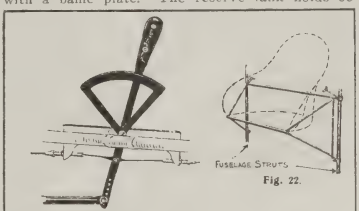
The radiator, as may be gathered from the scale drawings and sketches, is of the car type (another departure from modern German design), and is supported by steel tubes which are part of a fuselage frame. The radiating surface is surmounted by a curved fairing, of which the port-side half is a brass water tank, into which the filler leads, while the starboard side is merely an aluminum fairing. The radiator is constructed of brass tubes arranged parallel to the engine crankshaft. The tubes are circular in section, but expanded into hexagons at either end and sweated up there. Each hexagon measures 7 mms. across the flats.

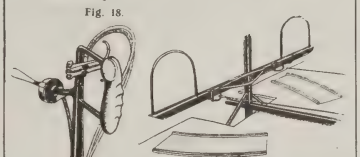
The single shutter, as will be seen on reference to Fig. 16, is normally held open by a spring, but can be closed at will by pulling a small cable. This shutter even when completely closed only puts out of action a small portion (roughly about one-third) of the cooling surface.

Petrol and Oil Systems

There is only one fuel and oil tank in the machine. It is of sheet brass and is slung from cross tubes clipped on to the top longerons, just in front of the ammunition magazines, which are placed immediately in front of the pilot.

So far as can be ascertained from such external evidence as is afforded by fillers, piping, the lines of rivets on the tank, and the gauges and petrol cocks, it may be said that this tank is divided into two petrol tanks and one oil tank. The main petrol tank has a capacity for 61 litres (approximately 13½ gallons), and is provided with a baffle plate. The reserve tank holds 33





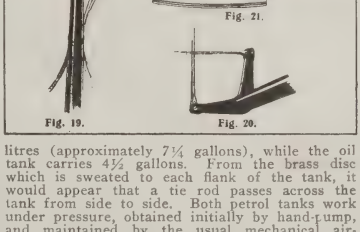


Fig. 18. Fig. 22.

Fig. 21.

Fig. 19. Fig. 20.

litres (approximately 7¼ gallons), while the oil tank carries 4½ gallons. From the brass disc which is sweated to each flank of the tank, it would appear that a tie rod passes across the tank from side to side. Both petrol tanks work under pressure, obtained initially by hand-pump, and maintained by the usual mechanical air-pump. The dashboard carries, besides the main switches and a starting magneto, a two-way cock which allows the pilot to use petrol from the main or auxiliary tank, or to shut it off completely. A separate pressure gauge for each tank and two two-way air pressure cocks are also mounted. Fig. 17 is a diagram of the dashboard with the original German descriptions translated. The "Achtung, Hohengas" appears to be simply a warning to the pilot not to forget the extra air control. It does not seem to bear any relation to any instrument on the dash.

Throttle Control

A sketch of the throttle lever, situated on the pilot's left, is given (Fig. 18). This lever actuates the carburettor throttle by the means shown. The compression tube between the quadrant and the balanced lever is over four feet long and about five-eights inch in diameter. Although heavy-looking, this control is, of course, made of very light gauge material. The adjustment provided at the pilot's end of the control should be noticed. The control works in conjunction with a Bowden type lever on the control lever, as shown by Fig. 19. The twin cables from this auxiliary throttle lever are attached to the main throttle control—Fig. 18 shows the attachments.

Controls

The control lever of the machine works on precisely the same system as that of the triplane, but the grip at the head of the column is quite different. Reference to Fig. 19 will show that the usual two-handed grip is replaced by a single handle for the right hand.

The left hand is free to manipulate the auxiliary throttle control, inter-connected with the main throttle lever. It should also be noticed that the usual pushes for firing guns are absent, and the interrupter gear is actuated by pulling either or both of the levers by the fingers, while the thumb rests on the specially arranged place. There is no separate arrangement for firing both guns together, and it is not possible to lock the elevator controls in any given position.

The longitudinal rocking shaft carries at its front end two arms to which the aileron control cables are fixed (see Fig. 20). These wires cross; and pass upwards and outwards to aluminium pulleys on ball bearings, which are attached in pairs to a hinged sheet steel framework. On the way these cables pass through short tubular guides fixed to the top longerons. The aileron levers follow contemporary British practice, and project vertically above and below the plane.

The elevator control wires are taken direct from the control lever, one pair above and one below the fulcrum.

The rudder bar (see Fig. 21) is of neat and light welded construction. There is no adjustment to allow for variation in leg-length of different pilots, but it should be notices that the pilot's seat is adjustable as regards height. The means by which this movement is obtained is exactly the same as the arrangement in the triplane, i.e., the seat is a sheet aluminium bucket with a three-ply bottom supported by a framework of of steel tubes which grips the fuselage cross struts by four clips, which can be placed at any height. This is made clear by Fig. 22.

Fabric and Dope

The fabric is not attached in any way to the longerons, but is simply carried over the fuselage and laced along the bottom central line. There is a cross-piece of fabric laced to the cross tubes immediately behind the cockpit.

The fabric is coarse flax, coarser and less highly calendered than the type usually met with, and a good deal heavier.

It is colour-printed in the usual irregular polygons. The bright red paint, mentioned below, is removable by alcohol, but not soluble in it, coming off as a skin under the treatment.

Under the paint is a dope layer—an acetyl cellulose. Neither paint nor dope presents unusual features.

Weights—

Paint	92.0 gms. per sq. m.
Dope	68.1 gms. per sq. m.
Fabric	143.6 gms. per sq. m.
	303.7 gms. per sq. m.
Strength .....1772 k/m.	
Extension	7.0 per cent.

Where the wings are not painted, the fabric is covered with a thin layer of dope only.

The coloring of the machine is interesting. The top surface of the wings is painted a brilliant vermilion, while on the underneath surfaces the fabric is untouched, and is revealed as the familiar printed-color fabric. The body is red in the front portion—where are the aluminium cowls—except the radiator, which is painted white. From the cockpit to the rear the color is white.

The vertical surfaces of the tail are also white, and the horizontal surfaces—on both top and bottom—black.

Schedule of Principle Weights

	lbs.	oz.
Upper wing, complete with ailerons, pulleys, bracing wires, facric and strut fittings	156	0
Lower wing (no ailerons fitted), complete with strut fittings and fabric...	97	0
N strut between wings	6	9
Straight strut, between fuselage and trailing spar of upper wing	2	8
Aileron frame, with hinge clips, without fabric	4	8
Rudder frame, with hinge clips, without fabric	4	11
Fin frame, without fabric	1	14
Tail planes (complete in one piece), without fabric	12	6
Elevators (complete in one piece), without fabric	11	2
Radiator, empty	48	0
Undercarriage strut, each	2	10
Undercarriage axle, w ith shock absorber bobbins	18	2
Bobbin, each	0	7
Shock absorber, each	3	9
Undercarriage (complete), without wheels and tires, and without plane, but including struts	29	4
Aluminium tube, forming rear spar of undercarriage plane	1	8
Wheel, without tire and tube	11	8
Tire and tube	9	4
Tail strut	1	15
Fabric, per square foot, with dope....	0	1
Bottom plane compression rib	0	15
Bottom plane ordinary rib	0	11
Top plane ordinary rib, at centre of plane	1	0
Bracket, with bolts, attaching top plane to fuselage struts	1	11
Main spar, top plane, including fillet for ribs, per foot run in centre	1	12

Owing to tapering ends the average weight per foot of the spars will be slightly less than this figure.

The new American-made dirigible airship in flight. It is equipped with two 150 H.P. Hispano-Suiza motors

AERO CLUB AWARDS MEDALS OF MERIT

THE Aero Club of America has awarded a medal of merit to Major B. L. Smith of the Marine Corps and Lt. R. A. D. Preston, U.S.N., to commemorate the first long distance flight made with the first twin-motored dirigible. The D-17, the largest naval dirigible, made a successful trip from Akron, O., to New York, on October 22nd.

The Navy Department's official statement reads as follows:

"Manned by aviation officers of the Marine Corps and the Navy, and with two civilian mechanics aboard, the first of the Navy's twin motor dirigibles, flew over Washington on October 22d at the completion of the first lap of approximately three hundred and fifteen miles, of a flight from Akron, O., to Rockaway, N. Y. The big dirigible landed at the Anacostia aviation

(*Continued on page* 429)

Getting the new dirigible ready for flight

GENERAL KENLY, COLONEL BRANT AND COLONEL DAVIS UP IN A BALLOON

ON October 17th the energetic Chief of the Air Service, Major-General William L. Kenly, Colonel H. B. Hersey, and Colonel A. L. Fuller, went up in a balloon piloted by Major J. C. McCoy. The balloon started from the Polo Grounds, Washington, D. C., and landed in the outskirts of Baltimore, after a trip of about three hours and fifteen minutes under most ideal weather conditions. There being little wind, the officers were able to scatter Liberty Loan posters over Washington. It was General Kenly's first balloon trip and he enjoyed it immensely.

On October 19th another ascension was made with the same balloon, which has a capacity of 35,000 cubic feet, and was filled with hydrogen. Colonel C. G. Brant, Colonel M. F. Davis and Major J. C. McCoy were the passengers and A. Leo Stevens, the veteran balloon expert, was the pilot. The wind was favorable and they landed at Everett, Penna., after having passed through Maryland, Virginia, West Virginia and Pennsylvania, crossing the Alleghany Mountains at 5,000 feet. They were up five hours and Colonel Brant and Colonel Davis, whose first trip it was in a balloon, were delighted with their experience.

Major McCoy has the distinction of holding the first balloon pilot certificate issued in America. Colonel Hersey, A. Leo Stevens and Major B. B. Daggett, who did the work of getting the balloon off, are veterans in the balloon game.

Major-Gen. William L. Kenly, Director of Military Aeronautics, recently made a flight in a free balloon from Washington. Here is shown the balloon just after it left the ground. The dragrope, which can be seen coiled at the left of the basket, has not yet been released. With him were Colonel A. L. Fulton, Colonel H. B. Hersey, and Major J. C. McCoy, who piloted the balloon

(*Continued from page* 428)

field for a fresh supply of fuel, but resumed its flight at 1:17 P. M. The start was made from Akron this morning at 1:10 A. M., Central Time, and the landing was made at 11:10 Eastern Time, a running time of nine hours, approximately 35 miles an hour. The flight over Washington was made at a low elevation, and as the dirigible flew over the new Navy Building, then circled over the White House and Treasury, thousands had a close view of it."

The dirigible, marked D-17, flew low over Washington and caused considerable commotion. Through the mark, D-17, the public learned that it was a naval dirigible. The ship has a hydrogen capacity of about 180,000 cubic feet, and is equipped with two Hispano-Suiza motors of 150 horse power. The following were the crew on board: Major B. L. Smith, Marine Corps; Lieut. R. A. D. Preston, U.S.N.R.F.; Lieut. (j. g.) D. T. Hodd, U.S.N.R.F.; Lieut. (j. g.) W. L. Hamlin, U.S.N.R.F.; Ensign J. Esterley, radio operator; and M. Roulette and James Royal, civilian mechanics.

This was the first trip made by dirigible from Akron to Washington, and from Washington to New York, therefore, it has historic value.

The only recent long distance trip on the part of a dirigible was made by a Goodyear Dirigible, the D-12, when it made a 360 mile flight from Akron, O., to Dayton, O., and return, last summer. The D-12 was equipped with a single motor, whereas the D-17 is equipped with two motors.

Before the flight, tiny rubber balloons were sent up to ascertain the upper air currents. They were inflated with hydrogen from the hydrogen bottle seen in the illustration. The officers in the photo are (left) Captain Smythe and (right) Major J. C. McCoy

NAVAL and MILITARY AERONAUTICS

Key to Abbreviations

AAD—Assigned to active duty.
ABC—Report to Army Balloon School, Arcadia, Cal.
ABC—Report to Army Balloon School, Arcadia, Cal.
ADO—Report to Aviation Supply Depot, Dayton, Ohio.
ADT—Report to Aviation Supply Depot, Dallas, Texas.
AFO—Report to Aviation Supply Depot, Fairfield, O.
AGC—Report to Aviation Supply Depot, Garden City, L. I., N. Y.
AHT—Report to Aerial Gunnery School, Houston, Texas.
AIR—Transferred to the Air Service, National Army, without change in rank or date of commission.
ALF—Report to Camp Alfred Vail, Little Silver, N. J.
AMV—Report to Aviation General Supply Depot, Morrison, Va.
AOV—Report to School for Aerial Observers, Hampton, Va.
APR—Report to School of Aerial Photography, Rochester, N. Y.
ARV—Report to Aviation Supply Depot, Richmond, Va.
ASM—Report to Aviation Mechanics' Training School, St. Paul, Minn.
BFT—Report to Barron Field, Fort Worth, Texas.
BRN—Report to Bakers Field, Rochester, N. Y.
BST—Report to Brooks Field, San Antonio, Tex.
CAF—Report to Carlstrom Field, Arcadia, Fla.
CAP—Commissioned as Captain, Aviation Section, Signal Corps.
CDT—Report to Aviation Concentration Camp, Dallas, Texas.
CFT—Report to Carruthers Field, Fort Worth, Texas.
CGC—Report to Aviation Concentration Camp, Garden City, L. I., N. Y.
CGS—Report to Aviation Concentration Camp, Greenville, S. C.
CIT—Report to Radio School, Carnegie Institute of Technology, Pittsburgh, Pa.
CJS—Report to Camp Jackson, Columbia, S. C.
CJW—Report to Camp John Wise, San Antonio, Texas.
CLR—Commissioned as Colonel, Aviation Section, Signal Reserve Corps.
CMV—Report to Aviation Concentration Camp, Morrison, Va.
CPA—Commissioned as Captain Air Service, National Army.
CPR—Commissioned as Captain, Aviation Section, Signal Reserve Corps.
CRI—Report to Chanute Field, Rantoul, Ill.
CSO—Report to the Chief Signal Officer, Washington, D. C.
CUI—Report to School of Military Aeronautics, Cornell University, Ithaca, N. Y.
CWT—Report to Call Field, Wichita Falls, Texas
DAF—Report to Dorr Field, Arcadia, Fla.
DAP—Report to Director of Aircraft Production, Washington, D. C.
DIK—Report to Camp Dick, Dallas, Tex.
DIS—Honorably discharged from service.
DMA—Report to Director of MilitaryAeronautics, Washington, D. C.
ELA—Report to Eberts Field, Loanoke, Ark.
EOT—Report to Ellington Field, Olcott, Texas.
FLA—Commissioned as First Lieutenant Air Service, National Army.
FLR—Commissioned as First Lieutenant, Aviation Section, Signal Reserve Corps.
FLT—Commissioned as First Lieutenant, Aviation Section, Signal Corps.
FOB—Report to Fort Omaha Balloon School, Omaha, Neb.
FRF—On duty requiring regular and frequent aerial flights.
FSO—Report to Fort Sill School for Aerial Observers, Fort Sill, Okla.
GIT—Report to School of Military Aeronautics, Georgia Institute of Technology, Augusta, Ga.
GLC—Report to Gerstner Field, Lake Charles, La.
HHN—Report to Hazelhurst Field, Mineola, L. I., N. Y.
JMA—Rated as Junior Military Aviator.
JRC—Report to Jackson Field, Riverside, Cal.
KST—Report to Kelly Field, So. San Antonio, Tex. (When specified in the order, the number of the field is given in parentheses)
LDT—Report to Love Field, Dallas, Tex.
LHV—Report to Langley Field, Hampton, Va.
MAC—Report to March Field, Allesandro, Cal.
MAJ—Commissioned as Major, Aviation Section, Signal Corps.
MAT—Report to Mather Field, Sacramento, Cal.
MDO—Report to McCook Field, Dayton, Ohio.
MIA—Report to U. S. Naval Air Station, Miami, Fla.
MIT—Report to School of Military Aeronautics, Massachusetts Institute of Technology, Boston, Mass.
MJA—Commissioned as Major Air Service, National Army.
MJR—Commissioned as Major, Aviation Section, Signal Reserve Corps.
MSC—Report to Radio School, Maryland State Agricultural College, College Park, Md.
OBS—Attached to the Aeronautical Service as Observers.
OSU—Report to School of Military Aeronautics, Ohio State University, Columbus, Ohio.
PFO—Report to Post Field, Fort Sill, Okla.
PMT—Report to Park Field, Millington, Tenn.
PUP—Report to School of Military Aeronautics, Princeton University, Princeton, N. J.
PWM—Report to Payne Field, West Point, Miss.
REL—Relieved from present duty.
RSD—Report to Rockwell Field, San Diego, Cal.
RTR—Retransferred to organization attached to previous assignment to aviation dutv.
RWT—Report to Rich Field, Waco, Tex.
SBI—Report to Scott Field, Belleville, Ill.
SAG—Report to Souther Field, Americus, Ga.
SGS—Report to Camp Sevier, Greenville, S. C.
SLA—Commissioned as Second Lieutenant Air Service, National Army.
SLR—Commissioned as Second Lieutenant, Aviation Section, Signal Reserve Corps.
SLT—Commissioned as Second Lieutenant, Aviation Section, Signal Corps.
SMA—Report to School of Military Aeronautics, Cambridge, Mass.
SMM—Report to Selfridge Field, Mount Clemens, Mich.
SRC—Report to Columbia School for Radio Officers, New York City.
TFT—Report to Taliaferro Field, Fort Worth, Texas. (When specified in the order, the number of the field is given in parentheses)
TMA—Report to Taylor Field, Montgomery, Ala.
UCB—Report to School of Military Aeronautics, University of California, Berkeley, Cal.
UIU—Report to School of Military Aeronautics, University of Illinois, Urbana, Ill.
UTA—Report to School of Military Aeronautics, University of Texas, Austin, Tex.
VBW—Report to Vancouver Barracks, Washington.
WAC—Report to Aviation Concentration Camp, Waco, Tex.
WCS—Wire to the Chief Signal Officer upon arrival.
WDM—Wire, Director of Military Aeronautics, upon arrival.
WFO—Report to Wilbur Wright Field, Fairfield, Ohio.

Notes

Note 1—Report to places mentioned in order named for temporary duty.
Note 2—Report to Dayton, Ohio, Chief Technical Section.
Note 3—Report to Dayton, Ohio, Production Engineering Dept.
Note 4—Report to Dayton, Ohio, Dis. Mgr. of Aircraft Finance.
Note 5—Report to Naval Hydroplane Station, Pensacola, Fla.
Note 6—Report to Standard Aircraft Corp., Elizabeth, N. J.
Note 7—Report to Dis. Mgr. Aircraft Finance, Detroit, Mich.
Note 8—Report to Students' Army Training Corps, Lafayette College, Easton, Pa.

FOREIGN NEWS

BRITISH

The Independent Air Force bombed the railways at Metz-Sablons on October 18 and at night dropped projectiles on the railways at Saarburg, according to an official announcement.

In withdrawing from Flanders and the Belgian coast the Germans not only gave up their submarine bases, but also left behind immense aerodromes. Before the enemy retirement northern Belgium might have been known as the home of the Gotha. By moving eastward the Germans lose the points nearest to England from which they used to carry out raids upon London and other English towns. Hereafter, it is believed, the Germans will find it increasingly difficult to make air raids upon London.

The evacuation of Ostend and Zeebrugge will make easier the work of the British navy in keeping the British Channel clear of submarines. The Germans also have been forced to remove the torpedo boats from these bases.

Germany has made herculean efforts to solve the problem of Mannheim and has failed. Night bombing continues to make life in that city almost unendurable. Its great chemical and munition works are vital to the Hindenburg armies. It cannot escape. Its huge buildings cannot be moved and the British airmen know their position exactly.

Continual bombing of the fiercest sort causes the workers to threaten to strike and fills the mass of the population with terror. Even if the workers do not strike, they are again and again driven from their post of duty, their rest is disturbed and their working capacity reduced. Peace at any price is becoming in Mannheim a cry that appalls the authorities. Anti-aircraft guns surround the town and their barrage is so thick that on a clear night the sky is overcast with the smoke of bursting shells. Kite balloons ring the place around and the cables holding these are connected with electrified wires.

Machine guns are mounted wherever there is any prospect of their firing effectively. Searchlights sweep the skies nightly. None of these devices nor all of them put together prevent bombers from droning through the darkness, one after another, across the lines along the silver ribbon of the Rhine.

The Britons, threading their way among the searchlights and bursting shrapnel at a great height, rush like shadows over the very rooftops of the town and fling down destruction while the archies and machine guns spread a harmless canopy of missiles over their heads. Perhaps in no other part of the theatre of war has the comparative helplessness of armed land folk against armed air folk been proved so strikingly as at Mannheim. In spite of the thickness of the perils that encompass the bombers, they come off with few casualties and often with none. There is one record of a year's bombing operations by the British against a place on the western front in which no Briton was wounded and no British machine lost.

Sometimes there is a false warning and all night long the populace awaits the thunder of bombs without any bombs falling. These warnings have caused the people to hear enemy machines when no enemy machine is anywhere near. Sometimes no warning is given when the Britons do come and in such cases the inhabitants get their first warning from the red flashes of bombs on the munition plants.

I have just heard of a fight on the Italian front in which one British fighting plane after a long chase, in company with a brilliant Italian airman, overtook nine Albatross scouts, manned by Austrians. Single-handed he fought the squadron, destroying four machines and scattered the others. Three of the Austrian machines fell on their backs and the fourth was telescoped after a nose dive. One Austrian pilot escaped in a parachute after his plane had turned turtle and could not be righted. The Briton rejoined his Italian companion uninjured.

Thirty hostile aeroplanes were destroyed, six driven down out of control, two downed from the ground, and one balloon shot down in flames, Field Marshal Haig reported on October 16 in his communique on aviation activities.

British flyers also bombed the Frescaty aerodrome, damaging a Zeppelin shed and wrecking a hangar. Casualties among the mechanics were noted. The enemy did not fire on the attacking squadrons.

Thirty three tons of bombs were dropped during the day and thirteen in night attacks. Eleven British planes were missing at the end of the day.

The official statement of October 24 dealing with the operations of the independent air forces says: "On Wednesday night we bombed railways at Burbach and Saarbrucken, chemical factories at Mannheim and railways at Coblenz, near Mainz, and at Metz-Sablons."

FRENCH

On October 21, along the west front and in Flanders, our observation squadrons carried out important work of reconnoissance and surveillance behind the enemy front. Two enemy planes were brought down, and a balloon was burned. During the early part of the night our bombing planes dropped 18,800 kilos of projectiles on important railway junctions, and, in particular, on the stations at Longuyon, Stenay, Hirson, Vervins, Marle, Montoornet, Rozoy-sur-Serre, Previsy-sur-Serre, and Liart. They noted a great number of hits on their objectives, following which fires broke out in the stations at Longuyon, Hirson, and Rozoy.

The official French report of October 24 says:

On October 23 observation planes, in the course of numerous reconnoissances, proceeded more than seventy kilometres (about forty-three and a half miles) inside the enemy lines. They brought back several hundred photographs. Two captive balloons were burned and twelve enemy machines were brought down or put out of action. The greater part of these successes were obtained in the region of the Aisne, where the vigilance of our pursuit machines was particularly exercised.

During the night our bombing machines dropped 14,500 kilos of projectiles on the railway station at Montcornet, Marle, Vervins, and Wassigny, with particular attention to Provisy, on which more than seven tons of explosives were dropped, causing several fires.

ITALIAN

On October 8 army and navy dirigibles, even though there was a strong wind, bombarded with great success the enemy's aviation fields and centres of concentration in the Trentino and on the Piave.

Great results were observed and numerous fires started as a consequence of the action. Our airships returned safely, notwithstanding the heavy fire from the enemy's anti-aircraft batteries.

On October 9 there was great aerial activity on all parts of the front. Many recognition flights and aerial combats. Our pursuit machines assaulted a large patrol of enemy machines which attempted to pass the battleline. Three were sent to earth and the remainder were compelled to retreat. Our bombing squadrons efficiently hit enemy trenches, cantonments and railroad stations, while special patrols, at a low altitude, fired by machine guns on columns of the enemy's soldiers marching to and from the front.

On October 10 bad weather, entirely adverse on all parts of the front, greatly reduced the aerial activity. Notwithstanding these conditions, numerous recognition and patrol flights were executed by our squadrons.

Naval machines at the front on the 10th and 11th accomplished with great results the bombardment of the Bay of Durazzo. All returned safely to their base.

On October 14, 15 and 16 bad weather hindered all aerial activity.

The Supreme Italian Command publishes the results of the aerial operations during the last part of September on our front.

Twenty-six enemy machines fell.

Eleven bombardments, during which 18 tons of explosives were dropped. More than 1,320 bombs of different calibre were dropped during the recognition flights.

Thirty-two thousand shots from machine guns were fired on enemy troops from special patrols at a low altitude.

Four thousand five hundred photographs of enemy positions were taken.

One million pamphlets were thrown inside hostile territory.

Long recognition flights were executed to Portogruaro, Cazzo Carnieo, Tolmezzo, the Valley of Drava at Toblack.

Wright Monument in France to Be Near Where He Flew

Paris.—The French Aero Club Committee, which is arranging to erect a monument to Wilbur Wright, inventor of the aeroplane has decided to place it near the small village of Auvours, near Le Mans, where Wilbur Wright made his first flight in France on August 9, 1908. The monument will be erected next spring.

French Plane Builder Dies

Paris.—Leon Morane, the French aviator and aeroplane builder, is dead.

In 1910 Leon Morane earned the reputation of being the leading French aviator. In July of that year he established a new record for speed, and in September ascended 8,471 feet, at that time the greatest height ever attained by an aviator. He was injured in October, 1910, and afterward gave his entire attention to the building of aeroplanes.

Belgian Rulers Visit Bruges by Aeroplane

Dunkirk.—King Albert and Queen Elizabeth of Belgium visited Bruges by aeroplane on October 22.

They left Dunkirk at 8:45 o'clock in the morning and landed at Bruges a half hour later. They visited the chief streets of the city and received a joyful welcome from the populace.

On their return they left Bruges at 11 o'clock.

The Italian Trade

A large K. seaplane brought down at Venice quite recently is said to have two motors, acting on one propeller shaft. The machine is on view in that vity, but illustrations of the craft are not very enlightening.

A new radiator, the Valcerusa, is coming very much to the front, several big engine builders fitting it. Among others the S. P. A. vertical motor on the S. V. A. is colled by a Valcerusa.

A Franco-Russian Alliance

M. Sikorsky, the designer and constructor of the giant biplane bearing his name, is now associated with the French Voisin Co., in the capacity of consulting engineer. It seems likely that he will devote himself to multiple-engined machines, and, considering his early entry into the field of large aeroplanes, the results of his experiments should be of interest.

Massachusetts Flyer with the British Is Reported Dead

Lieutenant John S. Ferguson of the British Royal Flying Corps, reported missing September 21, is now reported dead. Lieutenant Ferguson was twenty-five years old. He left Pittsfield, Mass., last spring and was commissioned in August. A brother, Lieutenant Thomas Ferguson, was killed while fighting with the British in April, and another brother, Andrew Ferguson, is overseas with a Canadian regiment.

In bombing the areas to the rear of the German lines the British aviators sent down one and one-half tons of bombs. The road was jammed with a mass of wreckage.

Germans Dread Winter and Raids By Allied Fliers

London.—A despatch to the Daily Mail from The Hague says: "From all information available here, in Germany there is a widespread dread of winter and of daily and nightly air raids from German aerodromes in Belgium, which are now in the hands of the Allies.

"It is indicated that such raids would produce internal results in Germany quite different from the present symptoms of unrest."

MODEL NEWS

Edited by John F. McMahon

Model Aeroplane Building as a Step to Aeronautical Engineering

Selecting A Wing Section

ONE of the problems of the Aeronautical Engineer is to pick the proper wing section for the machine he has under consideration. For a fast scout of light weight he must select a wing curve with a high ratio of lift to drift. This ratio is generally represented by the sign L/D.

Three wing sections, the first for a fast scout, the second for a medium fast machine and the third for heavy machines needing a great lift such as flying boats, will be found below. Also tables for each curve showing the coefficients of lift and drift (or resistance) at different angles of incidence of the wing from minus 4 degrees to plus 20 degrees are given, along with the ratio of lift to drift and the distance of the centre of pressure from the front edge of the wing at each angle of the wing.

The location of the centre of pressure in each wing section must be known, as the centre of gravity of the whole machine, and the centre of pressure must be in the same vertical line or as near to each other as possible.

The writer has selected these wing curves as they were designed to allow the use of large wing spars in the construction of the wing, which is desirable for the machine we are to build.

The formulae given herewith are put in for simplicity's sake. Though they look very difficult at first glance, the student will find that by looking closely at what the different symbols mean, the work is much simplified thereby.

Sustaining Power and Resistance of Wings

To figure the lift given by a wing we use the formula,

$$L = Ky\ AV^2$$

where Ky is the coefficient of lift at the angle of incidence, of the wing under consideration. A = the area of the wing in square feet and V^2 = the speed in miles per hour, squared.

For instance, we wish to find the lift of curve No. 1 at an angle of zero degrees having a wing area of 160 square feeet and traveling 120 miles per hour.

Substituting values for the above equation, we find alongside of 0° under Ky .000721, so we have

$$L = Ky \quad A \quad V^2$$

$$\text{Lift} = .000721 \quad 160 \quad 120^2 \text{ or}$$

multiplying, we have $.000721 \times 160 \times 14400 = 1661$ lbs. lift.

As the lift must be equal to the weight, it can be seen that the above would apply to a machine weighing 1661 pounds.

The resistance of this machine would be figured by the formula,

$$KxAV^2$$

where Kx is the coefficient of resistance. Looking under Kx along a line with zero° angle, we find the coefficient at the angle to be .0000653.

Substituting values for the above, we have,

Resistance = $.0000653 \times 160 \times 14400 = 150$ lbs. approx.

Weight = $Ky\ AV^2$, or the same as for lift.

$$Ky = \frac{W}{AV^2} \text{ or}$$

weight of machine, divided by the area, times the velocity squared.

The above equation can be used in determining the angle needed to sustain the machine at the lowest flying speed, or to ascertain the angle to set the wings to give the proper lift at full speed. For instance, we found the speed of 120 M.P.H. necessary to sustain the machine with an angle of zero degrees. Suppose we wanted the machine to have a minimum or slow flying speed of 60 M.P.H.; then, substituting values for the equation, we have

$$Ky = \frac{1661}{160 \times 3600} \text{ or } 1661 \div 2304000 = .002883$$

Looking at the table of Ky, we find this to be near 12 degrees, or roughly, 11 degrees 30 minutes. Then, in order to fly this machine at a speed of only 60 M.P.H. the pilot would have to drop the tail to give the wings an angle of incidence of 11 degrees 30 minutes to maintain horizontal flight.

Another equation for use in determining the speed a machine would have to make in order to fly is

$$V = \sqrt{\frac{W}{Ky\ A}} \text{ substituting values } \sqrt{\frac{1661}{.000721 \times 160}} \text{ or simply}$$

$$\sqrt{1661 \div (.000721 \times 160)} = 120 \text{ M.P.H.}$$

Again to find the area if we know the weight, speed and the

$$A = \frac{W}{Ky\ V^2} \text{ or}$$

Suppose we wanted to find the area needed for an angle of 10 degrees at a speed of 60 M.P.H.

Looking in Ky column we find opposite 10 degrees coefficient .002580, substituting values in the formula, we have

$$\text{Area} = \frac{1661}{.00258 \times 3600} \text{ or } 1661 \div 9.288 = 175.6 \text{ sq. ft.}$$

The student will see that a wing gives more lift as the angle increases until the critical or highest angle of lift, called the (burble) point is reached.

After this angle is reached the lift drops and the resistance increases.

As the lift increases with the angle, so the resistance increases.

(To be continued)

L of i = Angle of wing chord to wind.
Ky = Lift coefficient in lbs./sq. ft./MPH.
Kx = Drift coefficient in lbs./sq. ft./MPH.
L/D = Ratio of l'ft to drif .

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

A Tiny Tale Spun by the Housewife

To market to market
We hire a jit,
Wait forty minutes,
Then lickety split.

Over the roadway
Careening we go!
Even the airplanes
Seem placidly slow.

Faster and faster
We skid round the bend—
Yonder's a bridge—Oh,
Can this be the end?

Riggety jiggety,
Pop goes a tire!
List to that chauffeur's
Magnificent ire.

In again, on again,
Feeling quite pale;
Missing a cow
By the hair of her tail!

Racing with trolleys
And trucks—and a cop;
Hitting the high spots
A terrible flop.

To market to market
We hire a jit—
But do we return in it?
"Je vous dis"——NIT!

Courtesy Evening Journal.

The Insignia

The lieutenant was testing the squad in visional power. "Tell me, No. 1," he said, "how many men are in the trench-digging party over there?"

"Thirty men and one officer" was the reply.

"Quite right. But how do you know one is an officer at this distance?"

"Cos he's the only one not working."

—Ex.

Aerodonetics

(With Apologies to the White Knight or Somebody.)

'Twas solo and the ailerons
Did flit and flutter in the wake.
Too flimsy seemed the longerons
And the instructor outspake—

"Beware too level banks, my son,
The side slips and the other sins.
Beware the uppish stalls and shun
The dangerous tail spins."

He took his Curtiss ship in hand
And long the Figure 8 he sought.
Then rested sick on the trembling stick
And glided deep in thought.

And as in pannish thought he slid,
Rip-roarin' Texas, full of sand,
Came huffling on the nervy kid
And blew to beat the band.

One, two, three, four, and more and more
His spinning plane went blither block.
He hit the sward and in the Ford
He beat it for the Doc.

"And hast thou busted up the ship?
Back to the bench, thou monkey cage!
Oh, frowsy dub! Thou—blank—glub—glub—"
He stuttered in his rage."

'Twas solo and the ailerons
Did flit and flutter in the wake.
Too flimsy seemed the longerons.
AND the instructor outspake! ! ! ! !

L. W. F. Military Tractor

One of the successful types of military biplane, particularly interesting in its refinement of detail. The landing gear is of purely military design, such as has been adopted by the Allied Governments.

VALENTINE'S
VALSPAR
The Varnish That Won't Turn White

Valspar aids Airplane Efficiency

Valspar is the ideal varnish for airplanes and seaplanes in active service, because it is proof against water and weather, oil and gasoline, and the extreme vibration of the engine and machine-gun.

Valspar protects wood, metal or fabric with a coating of unsurpassable toughness and elasticity. It will neither blister, check, crack, nor turn white from exposure.

Valspar resists also the destructive effects of high speed and hard usage, and retains its protective qualities long after ordinary varnish requires renewal.

Valspar is in constant use in the air service of the Allies and has satisfied their most exacting requirements.

Our Airplane Department will gladly afford information and assistance in solving your varnish problems. To purchasing agents and superintendents of production we will send our book on airplane finishing free on request.

The Curtis Dreadnaught Propeller Cutting Machine, Model 55

THIS machine cuts four blades at a time, and cuts closer and more accurate than any other machine in the market.

It finishes the hub the same as all other parts of the blade.

It cuts with the grain of the wood.

It does not require a metal model; just a regular stock blade is sufficient.

It does not bump over the pattern.

It is manually operated, which gives it the advantage of the human touch required on accurate work.

The hand work required after this machine is from 3½ to 4½ hours on each blade.

It leaves just enough wood for cleaning up.

The Gift Your Aviator Wants

Non-Shatterable
RESISTAL EYETECTS

He can always use a pair of these non-shatterable goggles recommended by U. S. Army and standardized by U. S. Navy. Write for Booklet of aviators' experiences. **Go to the Store where EYETECTS are sold,** or—send $ 2 and his address for the goggle he wants. We guarantee delivery and satisfaction. Money back if you want it. Order now for timely Christmas delivery.

For Army and Navy Flyers
Manufactured only by STRAUSS & BUEGELEISEN 438 Broadway New York City

Bossert Sheet Metal Stampings for Aeroplanes are Standard

—and that's because they're made in the most efficient plant of its kind in America—both as to *equipment* and *organization*. There's not a pressed steel part used by the automotive industry that we're not equipped to make—and make *right*. We also do annealing, case hardening, nickel plating and electric and oxy-acetylene welding.

Let us estimate on your needs.

VOL. VIII NEW YORK, NOVEMBER 11, 1918 NO. 9

AUSTRIA-HUNGARY AND GERMANY SURRENDER

AS we go to press announcement is made that Germany has accepted terms paralleling those accepted by Austria-Hungary.

The armistice terms as announced by the U. S. State Department on November 4th, with parenthetical explanations of minor errors in cable transmission, are as follows:

MILITARY CLAUSES

One—The immediate cessation of hostilities by land, by sea and air.

Two—Total demobilization of the Austro-Hungarian army and immediate withdrawal of all Austro-Hungarian forces operating on the front from the North Sea to Switzerland.

Within Austro-Hungarian territory, limited as in clause three below, there shall only be maintained as an organized military force a (?) reduced to pre-war effectives. (Effectiveness ?).

Half the divisional, corps and army artillery and equipment shall be collected at points to be indicated by the Allies and the United States of America for delivery to them, beginning with all such material as exists in the territories to be evacuated by the Austro-Hungarian forces.

Three—Evacuation of all territories invaded by Austria-Hungary since the beginning of the war. Withdrawal within such periods as shall be determined by the commander-in-chief of the allied forces on each front of the Austro-Hungarian armies behind a line fixed as follows: From Picumbrail to the north of the Stelvio it will follow the crest of the Rhetian Alps up to the sources of the Adige and the Eisach, passing thence by Mounts Reschen and Brenner and the heights of Oetz and Zoaller. The line thence turns south, crossing Mount Toblach and meeting the present frontier Carnic Alps. It follows this frontier up to, Mount Tarvis, and after Mount Tarvis the watershed of the Julian Alps by the Col of Predil, Mount Mangart, the Tricorno (Terglou), and the watershed of the Cols di Podberdo, Podlaoiscam and Idria.

From this point the line turns southeast toward the Schneeberg and excludes the whole basin of the Save and its tributaries. From Schneeberg it goes down toward the coast in such a way as to include Castua, Mattuglia and Volosca in the evacuated territories.

It will also follow the administrative limits of the present Province of Dalmatia, including the north Lisarica and Trivania, and to the south territory limited by a line from the (semi grand) of Cape Planca to the summits of the Watersheds eastward, so as to include in the evacuated area all the valleys and water course flowing toward Sebenico, such as the Cicola, Kerka, Butisnica and their tributaries. It will also include all the islands in the north and west of Dalmatia from Premuda, Selve, Ulbo, Scherda, Maon, Paga and Puntadura in the north up to Meleda in the south, embracing Santandrea, Busi, Lisa, Lesina, Tercola, Curzola, Cazza and Lagosta, as well as the neighboring rocks and islets and passages, only excepting the islands of Great and Small Zirona, Bua Solta and Brazza. All territory thus evacuated (shall be occupied by the forces ?) of the Allies and the United States of America.

All military and railway equipment of all kinds, including coal belonging to or within those territories (to be ?) left in situ and surrendered to the Allies, according to special orders given by the commander-in-chief of the forces of the associated Powers on the different fronts. No new destruction, pillage or requisition to be done by enemy troops in the territories to be evacuated by them and occupied by the forces of the associated Powers.

Four—The Allies shall have the right of free movement over all road and rail and waterways in Austro-Hungarian territory and of the use of the necessary Austrian and Hungarian means of transportation. The armies of the associated Powers shall occupy such strategic points in Austria-Hungary at times as they may deem necessary to enable them to conduct military operations or to maintain order. They shall have the right of requisition on payment for the troops of the associated Powers (wherever ?) they may be.

Five—Complete evacuation of all German troops within fifteen days, not only from the Italian and Balkan fronts but from all Austro-Hungarian territory.

Internment of all German troops which have not left Austria-Hungary within the date.

Six—The administration of the evacuated territories of Austria-Hungary will be entrusted to the local authorities under the control of the allied and associated armies of occupation.

Seven—The immediate repatriation without reciprocity of all allied prisoners of war and interned subjects of civil populations evacuated from their homes on conditions to be laid down by the commander-in-chief of the forces of the associated Powers on the various fronts. Sick and wounded who cannot be removed from evacuated territory will be cared for by the Austro-Hungarian personnel who will be left on the spot with the medical material required.

NAVAL CONDITIONS

One—Immediate cessation of all hostilities at sea and definite information to be given as to the location and movements of all Austro-Hungarian ships.

Notification to be made to neutrals that freedom of navigation in all territorial waters is given to the naval and mercantile marine of the allied and associated Powers, all questions of neutrality being waived.

Two—Surrender to the Allies and the United States of fifteen Austro-Hungarian submarines completed between the years 1910 and 1918, and of all German submarines which are in or may hereafter enter Austro-Hungarian territorial waters. All other Austro-Hungarian submarines to be paid off and completely disarmed and to remain under the supervision of the Allies and the United States.

Three—Surrender to the Allies and the United States with their complete armament and equipment of three battleships, three light cruisers, nine destroyers, twelve torpedo boats, one mine layer, six Danube monitors, to be designated by the Allies and the United States of America. All other surface war ships, including river craft, are to be concentrated in Austro-Hungarian naval bases to be designated by the Allies and the United States of America and are to be paid off and completely disarmed and placed under the supervision of the Allies and the United States of America.

Four—Freedom of navigation to all war ships and merchant ships of allied and associated Powers to be given in the Adriatic and up the River Danube and its tributaries in the territorial waters and territory of Austria-Hungary.

The Allies and associated Powers shall have the right to sweep up all mine fields and obstructions, and the positions of these are to be indicated.

In order to insure the freedom of navigation on the Danube the Allies and the United States of America shall be empowered to occupy or to dismantle all fortifications or defence works.

Five—The existing blockade conditions, set up by the allied and associated Powers are to remain unchanged, and all Austro-Hungarian merchant ships found at sea are to remain liable to capture, save exceptions which may be made by a commission nominated by the Allies and the United States of America.

Six—All naval aircraft are to be concentrated and impactionized in Austro-Hungarian bases to be designated by the Allies and United States of America.

Seven—Evacuation of all the Italian coasts and of all ports occupied by Austria Hungary outside their national territory and the abandonment of all floating craft, naval materials, equipment and materials for inland navigation of all kinds.

Eight—Occupation by the Allies and the United States of America of the land and sea fortifications and the islands which form the defences and of the dockyards and arsenal at Pola.

Nine—All merchant vessels held by Austria-Hungary belonging to the Allies and associated Powers to be returned.

Ten—No destruction of ships or of materials to be permitted before evacuation, surrender or restoration.

Eleven—All naval and mercantile marine prisoners of the allied and associated Powers in Austro-Hungarian hands to be returned without reciprocity.

Hope is being expressed that similar terms can be forced on Germany in the near future. In the meantime the Allies will continue the war on Germany with renewed vigor and we in the United States must not relax an instant our efforts to prepare for victory.

As Premier Clemenceau points out, *"victory is certain, but peace may not be so near as some think."*

Great credit is due to those pioneer American Army aviators led by Major Fiorella La Guardia and naval aviators led by Commander J. Lansing Callan, who gave such material assistance and moral support to the Italians.

HUGHES AND GREGORY REPORTS ON AIRCRAFT INVESTIGATION

THE Hughes and Gregory reports of the aircraft investigation were made public on November 1st. The first covers 182 pages, the second covers twelve pages. They are the summary of five months of investigation during which nearly 300 witnesses were examined and 17,000 pages of testimony was taken.

Policy and Operations Not Investigated

The scope of the investigation was limited to investigating and pursuing charges of dishonesty and malversion in regard to the production of aircraft essentially to ascertain whether any section of the Criminal Code had been violated.

To better understand just what was investigated it is well to mention that the aeronautic branch of the Army has three main divisions, dealing with:

(a) *Policy:* Deciding on the size of the aircraft program.

(b) *Production:* Producing the aircraft required to carry out the program.

(c) *Operations:* Using the aircraft for training or for action, training of personnel, etc.

The investigation only touched on Productions.

The Hughes Report

Herewith is reproduced one section of the Hughes Report. The other sections will follow in future numbers:

WASHINGTON, D. C., October 25, 1918.

THE ATTORNEY GENERAL:

I have the honor to submit the following report of the Aircraft Inquiry:

The investigation has been concerned with Aircraft Production. Other activities relating to aviation, but not to production, have been touched only incidentally. Thus, upwards of thirty training or flying fields with numerous structures have been provided, and to meet other aviation needs a great variety of construction has been required, here and abroad. These enterprises, being aside from Aircraft Production itself, have not been the subject of this inquiry, save as transactions relating to Wilbur Wright Field and McCook Field have invited scrutiny by reason of the aircraft enterprises centered at Dayton, Ohio, and the activities of Edward A. Deeds and his former business associates.

Another governmental activity which does relate to Aircraft Production, but is conducted separately from the orders for Aeroplanes and Engines, is known as the Sales Department. The Government itself purchases large quantities of lumber, fabric, chemicals, etc., which it resells. When these commodities are supplied by the Government to contractors, the Sales Department is credited and the items are transferred to the other appropriate accounts. The largest item of this sort is for Spruce. The account of the Sales Department for the fiscal year ending June 30, 1918, shows that spruce orders amounted to $76,211,360.35 on which there had been deliveries and payments aggregating $6,357,853.83 leaving unfilled orders of $69,853,506.52; and of the spruce delivered the Government had resold to the extent of $3,679,155.95. It appears that the Government had also (to June 30, 1918) invested in its cut-up plant at Vancouver, Washington, the sum of $1,487,237.81. While to some extent testimony has been taken bearing on the spruce contracts, it became evident as the inquiry proceeded that it would be impossible to reach any satisfactory conclusion with respect to the transactions of the Spruce Production Division without a special inquiry on the Pacific Coast, which in view of the extent and character of the activities involved would probably take several months. It has not been practicable to undertake this as yet, in view of the magnitude of the work involved in other branches of the investigation, and accordingly it has been left to be undertaken hereafter by the Department of Justice as it may be advised. For this reason, a report on the operations of the Spruce Production Division or of the Sales Department will not now be attempted. Also, in view of the importance of the present inquiry in its special relation to aeroplanes and aeroplane engines, transactions of the Balloon Division have not been examined.

Aside from these limitation, the inquiry has taken a wide range. It has been prosecuted without pause since it was begun in the latter part of May last. About 280 witnesses have been examined and over 17,000 pages of testimony have been taken. The more important plants have been visited, and a large part of the testimony has been taken at these plants where books, records, employees and Government representatives have been available. To compass all the activities involved in Aircraft Production, reaching into a great variety of contracts and operations involving numerous plants and the expenditure of many millions of dollars, would require the constant efforts of a force of investigators for a year or more longer and also the services of an army of accountants charged with the responsibility of checking and auditing the work of the hundreds of Government representatives now supervising the contractors' accounts. It is impossible, of course, to say what irregularities or offenses such a protracted inquiry would bring to light, but the investigation has been sufficiently comprehensive to give, it is believed, a survey of the field as a whole and to disclose the facts bearing upon the serious charges which have been made.

In addition, and as a result of information received through this inquiry, there have been special proceedings before Grand Juries. This, on information of violations of the Sabotage Act at the Hammandsport (New York) plant of the Curtiss Aeroplane and Motor Corporation, the matter was examined by the Grand Jury and indictments were returned in the Western District of New York and there have also been indictments in the same District for violations of this Act at the North Elmwood plant, Buffalo, of the same corporation. There also has been a special investigation by the Grand Jury at Sacramento, with respect to conditions at the Liberty Iron Works.

It is manifestly impracticable to state the details of even the more important evidence, but the salient and controlling facts which have been elicited will be set forth, so far as this is deemed to be compatible with military exigency.

FIRST—APPROPRIATIONS AND EXPENDITURES

At the time of the declaration of a state of war with Germany, April 6, 1917, the appropriations available for aircraft production were those applicable to the fiscal year ending June 30, 1917. By the Act of August 29, 1916, the sum of $14,281,766 was appropriated for the expenses of the Signal Service, with the proviso that not more than $13,281,666 should be used for the purchase, manufacture, maintenance and operation of aircraft and of described vehicles necessary for the Aviation Section. It was further provided that not to exceed $50,000 should be used for the payment of all expenses in connection with the development of a suitable type of aviation motor and not more than $500 should be used for the cost of special technical instruction of officers of the Aviation Section. Of the total appropriation above mentioned the sum of $4,500,000 was later (Act of May 12, 1917) made available for the establishment of aviation schools and experimental stations, and it was under this appropriation that Langley Field, Virginia, was acquired and developed.

The Act of February 14, 1917, appropriated $3,600,000 for aircraft, buildings for equipment, and other accessories necessary in the Aviation Section, for use in connection with sea coast defenses.

The Act of May 12, 1917, appropriated for the expenses of the Signal Service, for the fiscal year ending June 30, 1918, the sum of $11,800,000, with the proviso that not more than $10,800,000 should be used for aircraft production, including experimentation, and for the buildings for equipment and personnel, and necessary accessories. The sum of $43,450,000 was appropriated by the deficiency appropriation Act of June 15, 1917, of which $31,846,067.16 became available, under the terms of the Act, for the fiscal year 1917-18.

Provision for an adequate aircraft program for the Army was not made until the passage of the Act of July 24, 1917, appropriating for aeronautical purposes the sum of $640,000,000.

STATEMENT FOR FISCAL YEAR JUNE 30, 1917 TO JUNE 30, 1918

The aggregate of all aeronautical appropriations which were available for the Army for the fiscal year ending June 30, 1918, were as follows:

Act of July 24, 1917	$640,000,000.00
Other aeronautical appropriations	51,851,866.47
Total	$691,851,866.47

The estimated obligations charged against these appropriations during the fiscal year amounted to $933,948,959.03. To the extent of $176,924,903.42, this excess represented obligations of the Sales Department already described, for which it was contemplated there would be reimbursement by resales. (Of this last-mentioned amount there were reported as disbursed in the Sales Department (to June 30, 1918) that is, for deliveries of materials, $25,966,739.95* the resales amounting to

*Corrections on further accounting raised this amount to $26,557,706.87.

$19,008,150.26, and the balance representing assets on hand.) Exclusive of the obligations of the Sales Department, the estimated aeronautical obligations of the Government for the fiscal year 1917-1918 amounted to $757,024,055.61. These obligations were calculated on estimated costs, and the excess over the total aeronautical appropriations (that is, over $691,851,866.47) will largely be offset by savings on the estimated costs and by cancellations of orders.

Obligations Other Than for Aeroplanes and Engines

The estimated obligations for the Aviation Equipment Division covered not only Aeroplanes and Engines, but a variety of equipment and other essentials. Thus, the testimated obligations, charged against the $640,000,000 appropriation, for Transportation including motor trucks, chassis, motor-cycles, bicycles, etc., amounted to $42,938,630.73; for General Equipment including various sorts of apparatus and supplies, $34,979,741.53; for Maintenance, including maintenance of supply depots, planting of castor beans, etc., $17,948,955.60; for Special Clothing for aviators, mechanics, etc., $2,520,512.63; for Machine Guns, Ammunition and Bombs, $29,249,033.29; for Acquisition of Plants, $2,595,599.82; and for Miscellaneous Equipment, including various incidental expenses of officers, stations and schools, $7,748,617.75.

There were also charged against the $640,000,000 appropriation the estimated obligations of the Construction Division, embracing training fields and construction here and abroad, amounting to $62,232,664.55; of the Balloon Division (covering balloons and accessories) $16,910,891.20; of the Schools Division, $1,016,223.48; and of the Finance Division (including the pay of Reserve Corps and of civilian employees, and the reserve for foreign expenditures) $35,963,417.55. The various estimated obligations for similar purposes, other than for Aeroplanes and Engines, which were charged against the other aeronautical appropriations for the fiscal year 1917-1918, aggregated $28,009,060.92.

Thus, out of the total estimated obligations ($757,024,055.61) for all aeronautical purposes (exclusive of the Sales Department) the estimated obligations for purposes other than Aeroplanes and Engines aggregated $282,113,349.06.

Obligations for Aeroplanes and Engines

The amount of the estimated obligations for Aeroplanes and Engines, and spare parts of both, (including experimental and development work) charged, to June 30, 1918, against the aeronautical appropriations for the fiscal year 1917-1918 was as follows:

Charged to the $640,000,000 appropriation.....	$457,379,122.15
Charged to other appropriations.....	17,531,584.40
Total.....	$474,910,706.55

Actual Disbursements for All Aeronautical Purposes

It should be noted that the amounts above stated represent estimated obligations, not actual disbursements. Although obligations were incurred, payments were to be made only as payments were earned by performance of contracts. Payments prior to June 30, 1918, were made on vouchers for amounts represented as earned, but such payments were only a part of the estimated obligations, by reason of delays in production. Further payments should be made only as production goes forward and contracts are duly performed.

Thus, as against the total estimated obligations for aeronautical purposes, aggregating $933,948,959.03 (including the Sales Department) the disbursements reported down to June 30, 1918, amounted to the sum of $430,224,316.99. Out of the $640,000,000 appropriation, the total disbursements for the fiscal year for all aeronautical purposes (that is, embracing those apart from aeroplanes and engines, as well as for the latter) amounted to $363,818,014.87;* and, according to the accounts of the Bureau of Aircraft Production, there remained of this appropriation in the Treasury of the United States on June 30, 1918, the sum of $276,181,985.13. According to the books of the Treasury Department, the unexpended balance of the $640,000,000 appropriation amounted on June 29, 1917, to $304,478,211.70. The difference of $28,296,226.57 is explained by the existence of unwithdrawn balances which had been alloted to the Quartermaster Corps and the Ordnance Department and by various credits pertaining to the month of June which were not received in the Bureau of Aircraft Production until July.

Actual Disbursements for Aeroplanes and Engines

The actual payments for the fiscal year 1917-1918 against the estimated obligations for Aeroplanes and Engines, and spare parts of both (including payments for experimental and development work), are reported by the Finance Division of the Bureau of Aircraft Production as amounting to $155,535,946.41 as follows:

Disbursed from the $640,000,000 appropriation..	$142,908,398.95
Disbursed from other appropriations.....	12,627,547.46
Total	$155,535,946.41

These disbursements included not only payments to contractors for articles delivered or on account of work and materials, but also advances in the nature of loans to contractors, upon security, made by the War Credits Board, and, in addition, the payments which had been made for the manufacture of planes and engines overseas.

The payments for manufacture overseas amounted to $25,605,074.31 as follows:

Cash remittances to overseas disbursing officers for payment on overseas contracts for Aeroplanes and Engines.....	$16,600,000.00
Paid on purchase of materials, supplies, etc., purchased by United States for shipment abroad to be used in overseas manufacture of Aeroplanes and Engines.....	9,005,074.31†
	$25,605,074.31

The unpaid balances of advances to contractors (whose contracts are embraced in the obligations for Aeroplanes and Engines above described), these advances being repayable to the Government, amounted on June 30, 1918 (exclusive of interest) to $21,491,551.14. The principal contractors who have received these advances are specified below:

Contractor	Advances Authorized	Advances Made	Balance Unpaid June 30, 1918 (without interest)
Curtiss Aeroplane and Motor Corporation	$8,000,000	$8,000,000	$5,561,645.94
Dayton Wright Aeroplane Co...	2,500,000	2,000,000	1,405,222.57
Duesenberg Motors Corporation.	1,650,000	1,650,000	1,632,447.97
Fisher Body Corporation.....	2,000,000	2,000,000	1,944,933.33
Lincoln Motor Co.....	6,500,000	6,500,000	6,255,392.00
Nordyke & Marmon Co.....	2,000,000	2,000,000	2,000,000.00
Packard Motor Car Co.....	5,000,000	5,000,000	1,731,232.00
Trego Motors Corporation.....	315,000	285,000	281,695.70
Willys-Overland Co.....	2,500,000	2,500,000	451,861.25
Various other contractors.....			227,120.38
			$21,491,551.14

The amounts paid, to June 30, 1918, on account of experimental and development work on aeroplanes and engines amounted to $1,697,830.19, of which the principal items are these:

Expeditures of Experimetal Station at McCook Field.....	$974,300.20
Director, Bureau of Standards.....	64,077.33
Department of Agriculture.....	34,540.82
Packard Motor Car Co.....	249,159.10
*Dayton Wright Aeroplane Co.....	48,120.39
Dayton Metal Products Co.....	66,097.14
Miscellaneous payments	261,535.21
	$1,697,830.19

Deducting these advances, and the payments of experimental and development work, th edisbursements to the end of the fiscal year, June 30, 1918, for Aeroplanes and Engines, and their parts, manufactured or in process of manufacture in the United States amounted to $106,741,490.77, as follows:

Total disbursed for Aeroplanes and Engines.....		$155,535,946.41
Less—		
For overseas manufacture.....	$25,605,074.31	
For advances to contractors.....	21,491,551.14	
For experimental and development work.	1,697,830.19	48,794,455.64
Disbursed on account of production in United States..		$106,741,490.77

Aeroplanes and Engines Delivered During Fiscal Year Ending June 30, 1918

The reported deliveries of Aeroplanes and Engines made prior to June 30, 1918, are as follows:

Aeroplanes

Elementary Training Planes		
JN4-D	2972	
SJ-1	1600	4572
Advanced Training Planes		
JN-4H		
Training	402	
Gunnery	321	
JN6-HB	100	
S4-B	100	
S4-C	73	
Penguin	50	1046
Combat and Bombing Planes		
DeH-4	529	
Bristol Fighter	24	553
Total planes		6171

Engines

Elementary Training		
OX-5	5474	
A7a	2188	7662
Advanced Training		
Hispano 150 H. P.	2188	
Gnome 100 "	209	
Le Rhone 80 "	68	
Lawrence 28 "	114	2579
Combat and Bombing		
U. S. 12 Cylinder (Army Type).....	1615	
U. S. " " (Navy Type).....	775	
Hispano 300 H. P.....	2	2392
Total engines		12633

For some of the units thus delivered, payments had not yet been made at the close of the fiscal year. The payments to June 30, 1918, covered about 5530 of the Aeroplanes delivered and about 9750 of the Engines delivered. In addition, there had been deliveries of various planes and engine parts, and the greater part of these were also covered by the payments above mentioned. And there were also large payments to contractors under cost-plus contracts for labor, materials and overhead charges in connection with work in process.

Allocation of Payments to June 30, 1918

The payments for the production of Aeroplanes and Engines, and parts, were made under two classes of contracts, (1) fixed-price and (2) cost-plus contracts:

Payments under fixed-price contracts.....	$57,193,621.06
Payments under cost-plus contracts.....	49,547,869.71
	$106,741,490.77

Fixed-price Contracts

In the case of payments under fixed-price contracts, the payments presupposed delivery to and acceptance by the Government of the articles contracted for. Most of the JN training planes, 150 of the Standard J-1 training planes, metal parts for Handley-Page planes, all the engines for the elementary training planes, and 1500 of the Hispano-Suiza 150 H. P. engines are embraced in the orders placed on a fixed-price basis. Large numbers of parts of planes and engines were ordered on the same basis.

The payments under fixed-price contracts are shown to have been distributed as follows:

For engines and their parts.....	$23,216,930.28
For aeroplanes and their parts.....	33,976,690.78
	$57,183,621.06

*Subject to correction by addition of $590,966.62 for Sales Department.

†This includes the compensation of the purchasing agent, The J. G. White Engineering Corporation, amounting to 3 per cent of the purchases, or $262,662.02.

*Other vouchers allowed before June 30, 1918, but not paid until later, $89,620.52.

Cost-plus Contracts

The cost-plus contracts for engines and parts related to the Liberty engines (U. S. 12s), most of the Hispano Suiza, and the Le Rhone, Gnome and Bugatti engines. Among airplanes, 1450 of the Standard J-1 elementary planes, the De Haviland 4 and Bristol service planes, and the Handley-Page wood parts, were under cost-plus contracts. The following is the distribution of payments under cost-plus contracts to June 30, 1918:

For engines and their parts	$28,748,487.44
For aeroplanes and their parts	21,199,382 27
	$49,547,869.71

These payments (being exclusive of advances in the nature of loans) embraced (1) cost of special tools and "increased facilities" owned by the Government, but located in contractors' plants, (2) fixed profits on completed units delivered, (3) royalties on completed units delivered, (4) cost of manufacture of completed units delivered, and (5) payments for work in process, that is, for materials, labor and overhead expense applicable to units in course of production. The distribution of these payments to June 30, 1918, is:

Special tools and increased facilities own by Government	$6,840,971.70
Fixed profits on completed units delivered	3,279,028.18
Royalties on completed units delivered	374,986.40
Payments to June 30, 1918, under cost-plus contracts for labor, materials and overhead charges applicable to delivered units and to work in process	39,052,883.43
	$49,547,869.71

It is impossible at this time, by reason of the state of accounts, to divide the last item covering cost of manufacture so as to give separately the manufacturing cost (exclusive of fixed profits and royalties) of the units which had been delivered and the cost of work in process at the close of the fiscal year.

APPROPRIATIONS AND OBLIGATIONS FOR FISCAL YEAR JUNE 30, 1918 TO JUNE 30, 1919

Continuance of Prior Appropriations

The Act of July 9, 1918, making appropriations for the fiscal year 1918-1919, continued the prior appropriation of $640,000,000, and other aeronautical appropriations, thus making them available for the present fiscal year and for the payment of obligations incurred prior to the passage of the Act. Under this provision the production orders given in the last fiscal year, which remain uncanceled, will be continued and payments will be made in accordance with the terms of the existing contracts as production progresses.

New Appropriations

The Act of July 9, 1918, also made a new appropriation for the Air Service of $884,304,758. This appropriation is available for the purchase, manufacture, maintenance, repair and operation of airships, war balloons and other aerial machines, with equipment, aviation stations, schools and fields; for the expenses of officers, enlisted men and civilian employees; and also for training, experimental work, creation, expansion, acquisition and development of plants, etc. Of this amout, there has been apportioned for Air Service Production the sum of $760,000,000, of which $200,000,000 has been set aside for Aeroplanes, their spare parts, instruments and accessories, $250,000,000 for Engines, their repair parts, instruments and accessories, and $200,000,000 for foreign expenditures. Various items for balloons, oils, gases and chemical, transportation, plants, miscellaneous equipment and supplies, experimentation, and pay of Reserve Corps and civilians make up the remainder.

Against this new appropriation, thus apportioned, the obligations incurred to September 30, 1918 (exclusive of the Sales Department), amounted to $151,580,503.25, of which $21,603,470.90 is for Aeroplanes, their spare parts, etc., and $102,746,372.91 is for Engines, their repair parts, etc. The total payments against the new obligations amounted, to September 30, 1918, to $3,670,707.66 (exclusive of foreign expenditures and transfers to other departments), leaving then unexpended of the new appropriation of $760,000,000, apportioned to Air Service Production, the sum of $756,329,292.34.

Payments Since June 30, 1918, and Total Payments to Date

The last financial reports available are of September 30, 1918. The disbursements to that date which were made after June 30, 1918, for all aeronautical purposes and were chargeable to the appropriations for the prior fiscal year (continued as above stated) are as follows:

Disbursed from the $640,000,000 appropriation (Act of June 24, 1917)	$128,265,028.41
Disbursed from other aeronautical appropriations	7,250,915.36
Total disbursed since June 30, 1918, under prior appropriations for aeronautical purposes	$135,515,953.67

The total disbursements for aeronautical purposes from June 30, 1918, to September 30, 1918, are in the aggregate:

Under appropriations prior to June 30, 1918	$135,515,953.67
Under appropriations after that date, as above	3,670,707.66
Total	$139,186,661.33

These disbursements for all aeronautical purposes cannot at present be apportioned so as to show separately the amounts disbursed since June 30, 1918, for Aeroplane and Engines and parts.

Deliveries to October 11, 1918

The total deliveries of aeroplanes and engines (exclusive of spare parts) to October 11, 1918, appear, by the Government's reports, to be as follows:

Training Planes	Since June 30, 1918	Total to October 11, 1918
JN-4D	615	3587
SJ-1	—	1600
JN-4H and JN-6H	609	1432
S-4B	—	100
S-4C	225	298
Penguin	245	295
E-1	12	12
	1706	7324
Engines for Training Planes		
OX-5	2532	8006
A-7a (Hall-Scott)	62	2250
Gnome 100 H. P.	69	278
Le Rhone 80 H. P.	679	747
Hispano 150 H. P.	824	3012
Lawrence	328	442
Service Planes	4494	14,735
DeHaviland-4s	1821	2350†
Handley-Page (parts 85% complete)	100*	100
Le Pere	5	5
SE-5	2	2
	1928	2457

Engines for Service Planes

Liberty (U S.)-12s	7299	9689†
Hispano 180 H. P.	242	242
Hispano 300 H. P	3	5
Bugatti	1	1
	7545	9937

*25 sets of wooden parts and no metal parts delivered to June 30, 1918.

†Since the above was prepared information has been received that, to October 18, 1918, 2556 DeHaviland-4s and 10,568 Liberty (U.S.)-12s have been delivered.

PAYMENTS FOR AEROPLANES CONDEMNED

Standard J-1 Training Planes

This type of plane was condemned as dangerous, in June, 1918, because of the unsuitability of the motor (Hall-Scott, A7a) used with it. There were 1600 of these SJ-1 planes ordered and delivered, and all deliveries had been made prior to June 30, 1918. The entire amount disbursed for these planes and their spare parts to September 30, 1918, the date of the last financial statement, is $11,027,733.61, of which $8,593,576.11 was under cost-plus contracts.

There were 2250 A7a engines ordered for these planes, all of which, with parts, have been delivered. The amount disbursed for these engines and parts (exclusively under fixed-price contracts) to September 30, 1918, amounted to $6,487,134.75.

The aggregate cost of the SJ-1 planes with the A7a engines, with spare parts, to September 30, 1918, amounted to $17,514,868.36.

There appears to have been no defect in the SJ-1 plane itself, and there is an expectation that it may be utilized by the installation of another engine. The cost of adapting these planes to such an installation may amount to $2000 a plane.

What salvage may ultimately be gained in this way, or on the A7a engines, cannot now be determined.

Bristol Fighters

The Bristol Fighter was condemned as unsafe in July, 1918. A contract for 2000 of these planes and for 1200 sets of spare parts had been placed with the Curtiss Aeroplane and Motor Corporation on a cost-plus basis at an estimated cost of $19,190,100.00. Orders were also given to the Hayes-Ionia Company and to the Lewis Spring and Axle Company, each for 400 sets of spare parts, at the estimated cost of $1,890,000, or $3,780,000 in all. The estimated cost of the British planes and spares was thus $22,970,100.00.

Only 27 had been delivered prior to cancellation, but there was a large amount of work in process. The amount shown by the accounts of the Bureau of Aircraft Production to have been paid on these contracts to September 30, 1918 (exclusive of "increased facilities" owned by the Government), is about $2,350,00. Taking the materials purchased for the Bristols, the labor and estimated overhead charges, it would appear that the total amount expended by the Curtiss Company in the course of the production of the Bristols was about $3,000,000. This does not include any claim for damages for the cancellation of the contract. The Finance Division of the Bureau of Aircraft Production makes a general estimate (which includes unpaid vouchers and possible claims for damages growing out of the cancellation of contracts) that the aggregate cost of the Bristol will amount to about $6,500,000. What salvage there may be on the materials cannot now be determined.

The Liberty engines intended to be used in the Bristols can be utilized in other planes.

On this estimate, the cost to the Government of the SJ-1 planes (with engines), and on the Bristol planes, subject to reduction by whatever salvage there may be, amounts to $24,000,000.*

SECOND—RESPONSIBLE OFFICERS AND ADVISORY BOARDS

By the Act of July 24, 1917, full authority was given to the President to provide, through the War Department, for the purchase, manufacture, maintenance and operation of all types of aircraft, with all necessary equipment.

Signal Corps

Under the Secretary of War, the authority to establish the aircraft program and the control and administration of matters relating to aircraft production for the Army were vested in the Chief Signal Officer, Brigadier-General George O. Squier. It was under his direction that the organization of the Aviation Section of the Signal Corps, with its various departments of production, supply, inspection and accounting, was effected. The matter of aircraft production was entrusted to the Equipment Division, which was organized on August 2, 1917. Edward A. Deeds was made Chief of this Division, with Sydney D. Waldon as his assistant. At the same time Robert L. Montgomery was made Chief of the Finance and Supply Division. There was a reorganization on August 29, 1917, by which these two divisions were abolished and the functions of both were transferred to a new Equipment Division with Edward A. Deeds in charge. Robert L. Montgomery was made the head of the Finance Department of the Equipment Division. Deeds, Montgomery and Waldon had been members of the Aircraft Production Board and in or about August. 1917, they were commissioned with the rank of Colonel. Thus, Colonel Deeds as head of the Equipment Division had direct charge, under the Chief Signal Officer, of all matters relating to aircraft production. On January 14, 1918, Colonel Deeds became Industrial Executive in the Executive Division of the Signal Corps and was succeeded by Colonel Montgomery as head of the Equipment Division, but despite the change in technical relation, it is apparent that Colonel Deeds remained in practical charge, under the Chief Signal Officer, of production. In February, 1918, William C. Potter became the head of the Equipment Division and remained in this position until the passage of the Act of May 20, 1918.

Bureau of Aircraft Production

By order of the President, dated May 20, 1918 (promulgated May 24, 1918), the Chief Signal Officer was put in charge of military signal duties, not connected with the Aviation Section; General W. L. Kenly was appointed Director of Military Aeronautics and charged with the duties which had formerly pertained to the Aviation Section, except so far as they related to aircraft production, and for the latter purpose the executive agency known as the Bureau of Aircraft Production was established. Mr. John D. Ryan was appointed head of this Bureau and thus became Director of Aircraft Production, Mr. Potter taking the post of Assistant Director.

ADVISORY BODIES

National Advisory Committee for Aeronautics

By the Act of March 3, 1915, an Advisory Committee for Aeronautics was established to consist of two members from the War Department, two from the Navy Department, a representative each of the Smithsonian Institution, of the United States Weather Bureau, and of the United States Bureau of Standards, together with not more than five additional persons qualified as experts. The prescribed duty of the

*Further information has been received that a contract is contemplated under which about $3,500,000 of Bristol parts may be used in a new type of plane, which, if successful, would reduce the estimated loss on the Bristols to $3,000,000 and the total loss on SJ-1s and Bristols, subject to salvage on the SJ-1s, to $20,500,000.

Committee was to supervise and direct the scientific study of the problems of flying with a view to their practical solution. This body has been continuously maintained; it has examined numerous inventions and has been engaged in scientific study. But it has had nothing to do with the formulation of the aircraft program or with decisions as to the types of planes or engines selected for production.

The Committee was also active in securing the adjustment reflected in what is known as the cross-license agreement for the payment of royalties for the use of patented inventions pertaining to aircraft.

Joint Army and Navy Technical Aircraft Board

This Board was constituted in the early part of May, 1917. It was composed of officers of special qualifications by reason of scientific study and experience, who were designated by the Secretary of War and the Secretary of the Navy, respectively. The declared purpose was to "standardize, so far as possible, the designs and general specifications of aircraft except Zeppelins." The Board has been in continuous existence and has made various recommendations. These, however, have not been controlling and the Board has had no authority to enforce its views.

Aircraft Production Board

The Aircraft Production Board was created in May, 1917, pursuant to a resolution of the Council of National Defense. Its function was solely advisory. The initial steps in organization were taken under the authority of the Council of National Defense by Howard E. Coffin, who became Chairman of the Board and selected the civilian personnel consisting of Edward A. Deeds, Sidney D. Waldon and Robert L. Montgomery. Mr. Coffin—Vice-President of the Hudson Motor Car Company—was a member of the Advisory Commission of the Council of National Defense. Mr. Deeds had been engaged in manufacturing enterprises at Dayton; in April, 1917, he had been appointed a member of the Munitions Standards Board and placed on the Sub-Committee on Fuses and Detonators. Mr. Waldon had formerly been a Vice-President of the Packard Motor Car Company. Mr. Montgomery was a member of the firm of Montgomery, Clothier & Tyler, bankers and brokers, of Philadelphia. In addition to the four civilian members, the Chief Signal Officer and Rear Admiral D. W. Taylor, Chief of the Bureau of Construction, were appointed members of the Board, representing the Army and Navy respectively.

While the Aircraft Production Board had no authority to commit the Government, the Board was continuously active in the formulation of programs and the adpotion of resolutions of advice. Numerous contracts for aeroplanes and engines were placed upon its recommendation. When the Equipment Division of the Aviation Section of the Signal Corps was organized in August, 1917, the work of the Board became of less actual importance, though it was still conspicuous in routine. Colonel Deeds, Colonel Waldon and Colonel Montgomery now had executive duties in the Equipment Division under the Chief Signal Officer, and for the most part the recommendations relating to the Army aircraft program naturally followed the views of the Army officers who were in actual control. Similarly, the recommendations relating to the Navy reflected Navy proposals. The Board, however, afforded a valuable opportunity for the interchange of opinion and the unification of effort.

Aircraft Board

The Aircraft Board, superseding the former organization, was established by the Act of October 1, 1917. This was composed of nine members, including the Chief Signal Officer (Major-General Squier) and two other representatives of the Army, and the Chief Constructor of the Navy (Rear Admiral Irwin) and two other naval officers. For the Army, the Secretary of War designated Colonel Deeds and Colonel Montgomery; and for the Navy, the Secretary of the Navy designated Captain N. E. Irwin and Lt.-Com. A. K. Atkins. The civilian members, appointed by the President, with the advice and consent of the Senate, were Mr. Coffin (Chairman), Richard F. Howe (who had been connected with the International Harvester Company) and Harry B. Thayer (President of the Western Electric Company)—the last-named being appointed in February, 1918.

The Act creating the Aircraft Board empowered it under the direction and control of the Secretary of War and the Secretary of the Navy, "to supervise and direct, in accordance with the requirements prescribed or approved by the respective departments, the purchase, production, and manufacture of aircraft, engines, and all ordnance and instruments used in connection therewith, and accessories and materials therefor, including the purchase, lease, acquisition, or construction of plants for the manufacture of aircraft, engines and accessories; Provided, that the Board may make recommendations as to contracts and their distribution in connection with the foregoing, but every contract shall be made by the already constituted authorities of the respective departments."

It was also provided that

"except upon the joint and concurrent approval of the Secretary of War and the Secretary of the Navy there shall not be established or maintained under the Board any office or organization duplicating or replacing, in whole or in part, any office or organization now existing that can be properly established or maintained by appropriations made for or available for the military or naval service."

In February, 1918, Acting Judge Advocate General S. T. Ansell gave an opinion to the effect that the provisions of the Act should be construed to contemplate "only advisory or recommendatory functions." Thereupon, the Chief Signal Officer, in an order approved by the Secretary of War and the Secretary of the Navy, defined the duties of the Aircraft Board as follows:

"a. To act as a clearing house between the General Staff and the Signal Corps for all matters pertaining to raw materials for foreign governments for the production of aircraft, the Equipment Division of the Signal Corps to act as purchasing agency.

"b. To act as a clearing house between the General Staff and the Signal Corps for all information in relation to requirements of foreign governments for aircraft to be manufactured in the United States.

"c. To act as a clearing huose for all information as to requirements as between the Army and Navy for aircraft and raw materials.

"d. To study the requirements of the Army and Navy as regards combat and training planes. To study types with the Technical Divisions of the Army and Navy to the end that recommendations be made that given types be placed with industrial plants best fitted to undertake their manufacture. The Aircraft Board shall have no direct communication with manufacturing plants, except through the medium of the procurement divisions.

"e. As a result of above studies the Aircraft Board may recommend that preparations be made for production before actual contracts are made.

"f. To recommend the placing of experimental contract.

"g. All programs should be made up by the Board from information which shall be furnished by the proper Army and Navy Military and Naval Branches on the one hand and the Equipment and Production Divisions of the Army and Navy on the other. All foreign cables respecting aircraft production should be cleared through the Board.

"h. The Aircraft Board should be the instrumentality through which contact is made on matters of large policy with other bodies such as Shipping Board, Allied representatives, etc."

Despite the broad language of the Act of Congress as to the power which might be committed to the Board under the direction of the Secretary of War and the Secretary of the Navy, it will be observed that this executive order had the effect of greatly limiting the authority of the Board and that it was denied even the right to hold "direct communication with manufacturing plants." It was further provided that all programs should be made up by the Board "from information which shall be furnished by the proper Army and Navy Military and Naval branches on the one hand and the Equipment and Production Divisions of the Army and Navy on the other." The manifest purpose was to leave no question that the actual control of aircraft production rested with the Military and Naval officers.

The Aircraft Board held frequent sessions, and continuously made recommendations upon which action was taken and contracts placed. the service of the Board being virtually that of a clearing house for proposals which generally emanated from the responsible authorities and in all cases were dependent upon the action of these authorities for their final approval and execution.

THIRD—PERSONAL INTERESTS

There are no common law offenses against the United States, and a charge of crime under Federal law must rest exclusively upon the violation of a Federal criminal statute (*United States* v. *Eaton,* 144 U. S. 677, 687; *United States* v. *George,* 228 U. S. 422).

The applicable statutes of the United States, dealing with the question of personal interest of officers and agents of the Government in Government contracts are the following:

(1) Section 41 of the Criminal Code of the United States, formerly Section 1783 of the Revised Statutes, provides:

"Sec. 41. No officer or agent of any corporation, joint stock company, or association, and no member or agent of any firm, or person directly or indirectly interested in the pecuniary profits or contracts of such corporation, joint stock company, association, or firm, shall be employed or shall act as an officer of agent of the United States for the transaction of business with such corporation, joint stock company, association, or firm. Whoever shall violate the provision of this section shall be fined not more than two thousand dollars and imprisoned not more than two years."

Under the statute, it is not enough that an interested person merely recommends or advises transactions with the Government. To constitute a violation of the statute, the interested person must *"be employed"* or *"act as an officer or agent of the United States for the transaction of business with such corporation,"* etc.

(2) Section 3 of the Act of August 10, 1917 (Food and Fuel Control Act), provides:

"Sec. 3. That no person acting either as a voluntary or paid agent or employee of the United States in any capacity, including an advisory capacity, shall solicit, induce, or attempt to induce any person or officer authorized to execute or to direct the execution of contracts on behalf of the United States to make any contract or give any order for the furnishing to the United States of work, labor or services, or of materials, supplies, or other property of any kind or character, if such agent or employee has any pecuniary interest in such contract or order, or if he or any firm of which he is a member, or corporation, joint stock company, or association of which he is an officer or stockholder, or in the pecuniary profits of which he is directly or indirectly interested, shall be a party thereto. Nor shall any agent or employee make, or permit any committee or other body of which he is a member to make, or participate in making, any recommendation concerning such contract or order to any council, board, or commission of the United States, or ay member or subordiate thereof, without making, to the best of his knowledge and belief, a full and complete disclosure in writing to such council, board, commission or subordinate of any and every pecuniary interest which he may have in such contract or order and of his interest in any firm, corporation, company, or association being a party thereto. Nor shall he participate in the awarding of such contract or giving such order. Any willful violation of any of the provisions of this section shall be punishable by a fine of not more than $10,000, or by imprisonment of not more than five years, or both; *Provided,* That the provisions of this section shall not change, alter or repeal section forty-one of chapter three hundred and twenty-one, Thirty-fifth Statutes at Large."

This section covers those who act in any advisory capacity. It has no application to transactions occurring before its passage.

It is apparent that the section was guardedly drawn and its limitations should be noted. The first sentence of the section applies to interested persons only where they *"solicit, induce,* or *attempt to induce"* any person or officer, who is "authorized to execute, or to direct the execution of contracts," to make any contract or give any order for labor, services, materials, etc. The use of different expressions in the different clauses of the section suggests possible shades of meaning. The act of *recommending* does not come within the first sentence unless it is found to amount to *"soliciting," "inducing"* or *"attempting to induce,"* nor does the first sentence cover solicitations addressed to others than the persons or officers duly authorized to make the contracts or give the orders.

The second sentence relates to "recommendations by interested persons, but it is limited to recommendations made "to any *council, board,* or *commission* of the United States, or any member or subordinate thereof" in the absence of the disclosure described. Apparently this sentence does not cover recommendations made to individual officers acting under the authority conferred upon them by law, who are not members or subordinates of a "council, board, or commission."

The third sentence provides that the interested person shall not "participate in the awarding of such contract or giving such order." This would seem to relate to those who take part in the actual awarding of the contract or giving of the order and not to those who act in an advisory capacity only.

The section concludes with the proviso that its provisions shall not alter or repeal Section 41 of the Criminal Code above quoted.

To come within these statutes an interested person must either (1) act as an officer or agent of the Government for the transaction of business with the concern in which he is interested, or (2) solicit, induce or attempt to induce the person or officer, who is authorized to execute or direct the execution of contracts, to make a contract with, or give an order to, the concern to which the interest relates, or (3) take part in a recommendation to a "council, board, or commission" or subordinate or members thereof, without the disclosure stated, or (4) participate in the award of the contract or giving of the order.

In connection with these statutes attention may be called to the following provision, which appears as a rider in the Appropriation Act of March 3, 1917, immediately following an appropriation for the distribution of documents (39 Stat. p. 1106):

"*Provided,* That on and after July first, nineteen hundred and nineteen, no government official or employee shall receive any salary in connection with his services as such official or employee from any source other than the Government of the United States, except as may be contributed out of the Treasury of any State, county or municipality, and no person, association or corporation shall make any contribution to, or in any way supplement the salary of, any government official or em-

ployee for the services performed by him for the Government of the United States. Any preson violating any of the terms of this proviso shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be punished by a fine of not less than $1000 or imprisonment for not less than six months, or by both such fine and imprisonment as the court may determie."

It will be noted that this provision, enacted in March, 1917, is not to be operative until July 1, 1919. It may be contended with force, that this constitutes a legislative declaration, by implication, that the action described by the provision, that is, the mere supplementing of the pay of Government officials by private contributions, should not be deemed contrary to law prior to the date fixed.

INDIVIDUAL RELATIONS OF OFFICIALS

Present Bureau of Aircraft Production
John D. Ryan—William C. Potter

There is no suggestion, and no evidence, that either Mr. Ryan or Mr. Potter has taken any part in Government transactions with any concern in which he had a personal interest.

Members of the Aircraft Board

The relations of the members of this Board who received commissions in the Army are stated hereafter. As to Mr. Coffin, and as to the Naval officers who were members of this Board, it should be said that there is no evidence that any one of them has taken any part in transactions or recommendations relating to any corporation, firm or association, in which he has an interest. Disclosures of interest in particular corporations have been made from time to time by Mr. Howe and Mr. Thayer and with respect to such corporations it appears that they have abstained from participating in the recommendations made by the Board; except that Mr. Howe in his disclosure of interest to the Board on February 12, 1918, stated that he was interested in a corporation holding preferred stock of the Willys-Overland Company and that he was present at the meetings of the Board on December 7th and December 18th when resolutions involving a contract with that Company were passed, but that he was not aware of such financial interest at those times. As the Board acts in an advisory capacity simply, Section 41 of the Criminal Code can not be regarded as applicable, and the limitations of Section 3 of the Act of August 10, with respect to mere recommendations, have already been pointed out.

Officers of the Signal Corps Formerly in Control of Aircraft Production

(1) The Chief Signal Officer

It does not appear that General Squier had any interest in any corporations or concerns transacting business with the Signal Corps. The defects in the organization, which was created under his direction for the purpose of aircraft production, are matters distinct from any question of personal interest and will be considered in another division of this report.

(2) Colonel Edward A. Deeds

The charges pertaining to personal interest in Government contracts relate particularly to Colonel Edward A. Deeds and grow out of the highly suggestive transactions with his former business associates at Dayton. These transactions have been subjected to careful scrutiny.

Colonel Deeds was born near Granville, Ohio, on March 12, 1874. There is testimony that he once said that his name originally was "Dietz". No public record has been found to this effect. Colonel Deeds denies making the remark attributed to him and states that his family has borne the name of Deeds for at least four generations—his great-grandfather of that name coming from Pennsylvania. For many years Colonel Deeds was an officer of the National Cash Register Company and was one of several connected with that organization who were indicted in the Federal District Court for the Southern District of Ohio, in 1912, for violation of the Sherman Anti-Trust Act. Upon the trial Deeds, with other defendants, was convicted, but this conviction was seat aside by the Circuit Court of Appeals (*Patterson* v. *United States,* 222 Fed. 599) and the prosecution went no further.

At the time of our entry into the War, Mr. Deeds had large business interests at Dayton. His intimate business associates were Charles F. Kettering and H. E. Talbott. Mr. Deeds and Mr. Kettering (an inventor and engineer of ability) have been jointly associated in many enterprises with equal shares, it being their policy to organize corporations and to take their respective interests in stocks. Mr. Deeds has supplied the financial talent and Mr. Kettering, who is without any aptitude for business details, the engineering skill. They have had, and still have, a common agent of a highly confidential sort, George B. Smith, of Dayton, who holds the power of attorney of each, keeps their respective books, has charge of their bank accounts, signs their checks and generally looks after their financial affairs. They are still associated in various undertakings and their relations are of the most intimate character.

In 1904 Kettering was employed in National Cash Register Company as a designer in the engineering department, and later he became associated with Deeds in the development of what is known as the Delco ignition system for automobiles. In the course of this development Deeds and Kettering organized the Dayton Engineering Laboratories Company, known as the Delco Company. The enterprise was successful and the common stock was sold by Deeds and Kettering in 1916 to the United Motors Corporation for several million dollars in cash and certain shares of stock. Deeds and Kettering each retained a few shares of preferred stock; Deeds continued as President of the corporation, with a salary of $60,000 a year, and Kettering as Vice-President, with a salary of $50,000.

In April, 1915, Deeds, Kettering, H. E. Talbott, Sr., and his son, H. E. Talbott, Jr., organized the Dayton Metal Products Company with a capital stock of $200,000. The stock was held as follows: Talbott, Sr., 900 shares, Deeds 500 shares, Kettering 499 shares, Talbott, Jr., 99 shares, Charles H. Mead, 1 share, and George B. McCann, 1 share. Prior to our entry into the war, this Company had profitable fuse contracts with the British Government and had accumulated a considerable surplus. It appears that in the Spring of 1917 both Deeds and Talbott were appointed on the Sub-Committee on Fuses and Detonators of the Munitions Standards Board. In 1916, the Company had a contract with the Navy Department for fuses and it received other fuse contracts from the Navy and the Ordnance Department of the Army in 1917. As Vice-President of this Company, Deeds had a salary of $25,000 a year. The relation of the Dayton Metal Products Company to aircraft production is that this Company, in the latter part of the year 1917, acquired all the stock (save four qualifying shares) of the Dayton Wright Aeroplane Company and also has sub-contracts for metal parts with contractors making aeroplanes and engines. The Dayton Metal Products Company also subscribed and paid for 1,000 shares (par value $100,000) of the stock of the Lincoln Motor Company which was organized to build Liberty engines and has a paid up capital stock of $850,000.

In September, 1916, Deeds and Kettering organized the Domestic Building Company of Dayton, for the purpose of erecting and financing plants for the use of various companies. The capital stock is now $1,000,000, of which all but four qualifying shares are held by Deeds and Kettering in equal parts. This Company owned the land and erected the building acquired by the Dayton Wright Aeroplane Company for its principal aeroplane plant.

On April 9, 1917, the Dayton Wright Aeroplane Company was incorporated with a capital stock of $500,000 by Deeds, Kettering, H. E. Talbott and H. E. Talbott, Jr., in conjunction with Orville Wright. They had taken over the former Wright organization and thus had started an aeroplane enterprise at Dayton in a small way in the Summer of 1916. The larger enterprise of the Dayton Wright Aeroplane Company was launched about the time of our entry into the war, manifestly with the expectation of obtaining Government contracts. While Deeds was one of the incorporators, he did not become a stockholder, the subscriptions for the first 5,000 shares being as follows: H. E. Talbott 1,990 shares, C. F. Kettering 2,000 shares, H. E. Talbott, Jr., 990 shares, George H. Mead 10 shares, and C. A. Craighead 10 shares. In August, 1917, the capital stock was increased to $1,000,000 ($600,000 common and $400,000 preferred). The new common stock was taken by Messrs. Talbott and Kettering in the proportion of two-fifths, two-fifths and one-fifth. There were early negotiations for a Government contract and as early as June 12, 1917, a contract with the Company was recommended by the Aircraft Production Board. The contract was executed on August 17, 1917 (under date of August 1, 1917) and was for 400 Standard J-1 training planes at the fixed price of $6,500 each. For this there was substituted the contract dated September 7, 1917, which was also recommended by the Aircraft Production Board and was approved by General Squier. This contract was for 400 Standard-J aeroplanes, 2,000 DeHaviland-9s and 1,500 Martinsydes with spare parts. By later modifications the Martinsydes and DeHaviland-9s were omitted and provision was made for 4,000 DeHaviland-4s. These contracts were on a cost-plus basis, the estimated amount involved being upwards of $30,000,000. There was to be a fixed profit of $620 on each Standard-J plane and $875 on each DeHaviland, making a total fixed profit of about $3,750,000, exclusive of fixed profit on spare parts covered by the contract, thus expected to be earned, according to the contemplated deliveries, before the end of 1918. The contract also provided for additional profits to the extent of 25% of the saving under the bogey or estimated cost of the planes ($7,000 on the DeHavilands) and it is estimated that the additional profit on this basis would have amounted to over $2,600,000. When the bogey cost of $7,000 was fixed, letters were obtained from the Dayton Wright Aeroplane Company, and from the Fisher Body Corporation (which also had a contract for DeHavilands), that after 250 machines had been produced there would be an equitable adjustment if the bogey cost was found to be 'materially wrong'. Accordingly, a contract is now about to be signed reducing the bogey cost to $5,000 and the fixed profit to $625 per plane. Even at this rate, the fixed profit on the 4,000 DeHavilands will be $2,500,000, and it is believed that there will be an additional profit through saving under the bogey cost, and on spare parts, of not less than $1,000,000. In August and September, 1917, when the first Government contracts were awarded, the capital stock of the Company ($1,000,000) had not been paid in. It was not paid in until December 1, 1917, when, in one transaction, the stock was paid for and all the shares, preferred and common, save five qualifying shares were transferred to the Dayton Metal Products Company, which thus became and still remains the owner of the Dayton Wright Aeroplane Company. As the latter company practically received nothing on the issue of its capital stock save the fixed property represented by its plants, it was lacking in working capital and this at the outset was supplied by various loans and advances of the interested parties. In December the Government agreed to advance the Company $2,500,000, of which $1,500,000 was advanced at once.

The name of Orville Wright was used in this enterprise, but his chief activity has been as a consulting engineer in connection with experimental work. He has not been responsible for production. Mr. Kettering is an engineer of ability, but his work also has been that of experimental engineering; he is not a manufacturing or production expert. Much emphasis is placed by the parties concerned upon the fact that they were able to avail themselves of the old Wright organization which had been continued as already stated. But this was a very slender basis for the prompt selection of this newly-organized company, which had not even completed its financial arrangements as one of the few companies immediately admitted to the advantages of large and highly profitable Government contracts. The promoters of this enterprise, not content with these profits which were to accrue to them either directly or through their ownership of the Dayton Metal Products Company at once took advantage of the opportunity to increase their gains by salaries as executive officers of the Dayton Wright Aeroplane Company. Dating from August 1, 1917, the salaries thus allowed were as follows: H. E. Talbott, Sr., $35,000; C. F. Kettering, $35,000, and H. E. Talbott, Jr. (thirty years old, who was made president of the Company), $30,000. Talbott, Sr., was at the time receiving, and continued to receive, $60,000 a year as president of the Dayton Metal Products Company; Kettering received a salary of $25,000 from the Dayton Metal Products Company and $50,000 from the Delco Company; and Talbott, Jr., was also receiving a salary of $18,000 from the Dayton Metal Products Company.

There would seem to be no question but that the members of the Aircraft Production Board in recommending contracts had confidence in the capacity of those undertaking the venture, and the previous success of this group; while Mr. Deeds had been associated with them, was well known. But the fact remains that practically at the inception of the Government's aviation activity in connection with the War, and within the sphere of Colonel Deeds' important if not commanding influence, his former business associates were placed at once through Government contracts in a position where they had the assurance of very large profits upon a relatively small investment of their own money and in addition were able to secure generous salaries which they charged against the Government as part of the cost of manufacture.

That Deeds, Kettering and Talbott continued to be on the most intimate and confidential footing in connection with the prosecution of the Government work by the Dayton Wright Aeroplane Company is apparent from their correspondence, of which the following are excerpts:

Letter Deeds to Kettering, June 13, 1917:

"WASHINGTON, June 13, 1917.

"MR. C. F. KETTERING,
City National Bank Building,
Dayton, Ohio.

"MY DEAR C. F.:

"You will be interested to know that the standard training machine is going to be called the U. S. primary training and will not be called the Curtiss J.N. This was decided last week and I forgot to tell you when in Dayton.

"Provision will be made for either Mr. Coffin or myself to appear before the S.A.E.*, and as I am one of the Committee on Arrangements will see that the plans of the Aircraft Production Board get properly before the Association.

"Relative to the design of planes, I do not care to write what is being done but will discuss it with you when I get home and you will

*Society of Automotive Engineers.

see that we have already gone away down the pike in this matter. Everything is lining up now in pretty good shape.

Yours very truly,

E. A."

Telegram Deeds to Talbott, July 3, 1917:

"July 3, 1917.

"Mr. H. E. Talbott,
Dayton, Ohio.

"General Squier went direct to Detroit. Will probably spend fourth at his old home in Michigan. May be in Dayton Thursday or Friday, arriving there from Detroit or from Champagne, Illinois. Harold, Kettering and Wright can take care of him. He will be interested in the Dayton Wright factory and laboratory, Orville Wright laboratory and especially Mr. Kettering's views on scientific subjects. In general he is highly technical.

E. A. Deeds."

Telegram Kettering to Deeds, August 4, 1917:

"Dayton, Ohio, August 4, 1917.

"E. A. Deeds,
Room 527 Munsey Building,
Washington, D. C.

"We believe all confidential telegrams should be sent to Mr. H. E. Talbott, Sr., City National Bank Building, or George B. Smith, instead of the Dayton Wright Aeroplane Company.

C. F. Kettering."

Telegram Deeds to Kettering, August 4, 1917:

"August 4, 1917.

"Mr. C. F. Kettering,
City National Bank Building,
Dayton, Ohio.

"Hereafter all confidential telegrams will be sent to H. E. Talbott, Sr., instead of to the Dayton Wright Aeroplane Company.

E. A. Deeds."

Telegram Deeds to Talbott, September 16, 1917:

"Old Point, Virginia, September 16, 1917.

"H. E. Talbott,
Dayton, Ohio.

"For your personal information as coming from your local attorney. Judge Advocate General has ruled it legal for Government to select one, contractor one and the two a third, as appraisers of market value of plant at expiration of contract. If you care to raise the question the above will be found to be the final ruling.

"E. A. Deeds."

When this last telegram, which puts in a strong light the relations of the parties, was sent, Deeds was an officer in the Army. This highly improper conduct, in holding communication in this manner with his former business associate in a transaction pending between the Dayton Wright Company and the Government Department in Colonel Deeds' charge, demands the attention of the military authorities.

But evidence of favoritism, influence, or confidential communications of this sort, however otherwise reprehensible, do not make out criminal liability under the statutes above quoted, unless it appears that the representative of the Government has a pecuniary interest in the Government contract or order, or is an officer or stockholder of, or has a pecuniary interest in, a corporation, firm or association which is a party to the Government contract or order. And the question is whether Colonel Deeds had such an interest. His statement is that he had no such interest but on the contrary had given up large salaries to devote himself to the Government service.

About the time he received his commission as Colonel in the Army, Mr. Deeds addressed the following communications to the Secretary of War and to the Aircraft Production Board, under date of August 28, 1917:

"Washington, D. C., August 28, 1917.

"Hon. Newton D. Baker,
Secretary of War,
Washington, D. C.

"Dear Sir:

"You have honored me by appointment temporarily as an officer in the Regular Army of the United States, and as a member of the Aircraft Production Board connected with your Department. It is possible that this Board in the development of the aeroplane work may wish to recommend a contract with some of the corporations in which I have had an interest. Following the advice of counsel, I have resigned my official relations with these corporations, and made bona fide transfers of my stock therein to other parties.

"For your protection as well as my own, I desire to file with your Department a copy of a written disclosure of my relations, both past and present, to these corporations which I have this day filed with the Aircraft Production Board, and I enclose same herewith.

"In serving in the positions to which you have appointed me, I desire to comply with both the spirit and letter of the law, and to do no act which might invite criticism upon myself or your Department.

"I count it an honor and privilege to be thus called into the service of our country and am pleased to make whatever sacrifice of time and money that service may demand.

"I enclose a second copy of my statement to be filed with you as Chairman of the Council of National Defense.

Yours very respectfully,

(Signed) E. A. Deeds."

"Washington, D. C., August 28, 1917.

"The Aircraft Production Board,
Washington, D. C.

"Gentlemen:

"As a member of your Board and interested in the letting of contracts on the recommendation of that Board on behalf of the Government, I desire at this time to make a full and complete disclosure of the interest I may have in any corporation which might be a party to any such contract, or which might furnish supplies to the Government through the instrumentalities of your Board.

"I was a stockholder and officer in the following, to wit:

"(1) The United Motors Company of New York, being a union of several companies manufacturing automobile parts.

"(2) The Dayton Engineering Laboratories Company, of Dayton, Ohio, manufacturers of ignition and starting devices for automobiles.

"(3) The Dayton Metal Products Company, of Dayton, Ohio, engaged among other things in the manufacture of munitions.

"(4) The Domestic Building Company, of Dayton, Ohio, a corporation formed for the development of real estate and which now owns the land and buildings leased to The Dayton Wright Aeroplane Company.

"In all of the foregoing corporations I have severed my official connection therewith by resignation and have made a bona fide transfer to other parties of all my stock therein.

"In addition to the above corporations, I was an incorporator of The Dayton Wright Aeroplane Company, but never owned any stock therein., I am also the president of and a large stockholder in The Domestic Engineering Company, of Dayton, Ohio, makers of Delco Light Plants, and expect to retain my official connection therewith and my financial interest therein.

"I also own the ground embraced in The Moraine Experimental Flying Field near Dayton, Ohio, used for aviation purposes but out of which I receive no compensation.

"I make this disclosure now so that your Board, as the representative of the Government, may be fully informed as to my relations, past and present, with these corporations, and be thus enabled to act wisely on any order or contract involving any of these corporations either directly or indirectly. I desire that this written disclosure be recorded in the minutes of your Board for the mutual protection of all of us.

Yours very respectfully,

(Signed) E. A. Deeds."

The facts with respect to the disposition of Colonel Deeds' interests (so far as pertinent to this inquiry), and the method of disposition, are as follows:

United Motors Corporation
Dayton Engineering Laboratories Company

The significance of Colonel Deeds' statement with respect to the disposition of his interests in these corporations is that the Delco ignition system is used in the aeroplane engine known as the Liberty motor. In the planes manufactured abroad, the magneto ignition system had been used and, prior to its use on the Liberty motor, it appears that the Delco system had not been employed on an aeroplane engine. In the specifications for the Liberty motor, the Delco system was required to be installed with the first 20,000 engines. As already stated, the Delco system is controlled by the Dayton Engineering Laboratories Company (Delco Company) and this company is owned by the United Motors Corporation.

On the sale of his Delco stock to the United Motors Corporation, Deeds had received, in addition to cash, 30,000 shares (no par value) of its stock. [The total issued stock amounted to 1,200,000 shares.] After certain distributions, he still held at the time in question 17,500 of these shares. He also had an interest in a pool of certain shares, on which 3,880 additional shares were received in November, 1917. In his letter (above quoted) to the Aircraft Production Board, Deeds stated that he had severed his official connection with the United Motors Corporation and had made a *bona fide* transfer of his shares. He had resigned as Vice-President and director on August 16, 1917. The only transfer made by him of any of his shares in that company was by gift to his wife. He endorsed, for transfer, the certificates for 17,500 shares on October 13, 1917, and they were transferred to Mrs. Deeds' name on October 17, 1917. Thereafter, it is testified, they were held by the confidential agent, George B. Smith, for her account. Entries of the transfer were made in Colonel Deeds' books by Smith not earlier than October, 1917, and were dated back to August 28, 1917. In the statement of his assets on August 31, 1917, submitted to him by Smith, the shares appear as part of his property. Mrs. Deeds' name first appears in the statement of assets of October 31, 1917. The remaining shares (3,880) received on the dissolution of the pool about November 22, 1917, were transferred from the pool manager directly to Mrs. Deeds, as Mr. Deeds' letter and the certificates were received by Smith on her behalf. Prior to the transfer of the stock in October and at the time of Colonel Deeds' letter to the Aircraft Production Board, he had simply told his wife that it was to be her stock, and it does not appear that there had been an effective gift of the shares. The actual value of the 21,380 shares was approximately $500,000.

In addition to these shares in the United Motors Corporation, Deeds also held 38 shares of Delco preferred stock, which he had retained at the time of the sale of his common stock. These preferred shares he transferred to Kettering. It appears that the transfer was first entered by Smith in Colonel Deeds' private journal in December, 1917. The date of the entry was afterwards changed to August 28, 1917, to correspond to the date when Smith was notified that Colonel Deeds had received his commission in the Army. The stock was transferred to Kettering on the books of the company on October 13, 1917. The payment was made by debits in Deeds' open account with Kettering.

If there were evidence that Colonel Deeds had acted as officer or agent of the Government in the transactions with the Delco Company, or with the United Motors Corporation, prior to October 13, 1917, there would be ground by reason of his interest for charging a violation of the statute, and it may be doubted whether there was then or thereafter such a transfer as would avail to take the case out of the statutory prohibition. But there is no evidence that Deeds acted for the Government in any transaction with either of these corporations. So far as appears, the Government made no contracts for Delco ignition either with the Delco Company or with the United Motors Corporation. The contracts for the Delco system were made by the contractors who were manufacturing the engines under contracts with the Government, and the dealings with the Delco Company or with the United Motors Corporation in relation to the Delco system were had by these contractors. It must also be said that, despite the natural inference from former business association and interests, the proof is lacking that the selection of the Delco system was due to the solicitation of Deeds. It can hardly be questioned that the design of the Liberty motor contemplated the use of the Delco system, and that the magneto system could be used only by a special adaptation. The Delco system, however, had been extensively used for automobiles, notably by the Cadillac and Packard companies, and was in high favor with those who were developing the Liberty motor. While there has been a question as to which system was preferable, and it has been understood that foreign representatives at first did not approve the departure from foreign practice, and many may still be found to disapprove it, there is considerable evidence that the use of Delco ignition has been growing in favor, and there has been testimony in this investigation from impartial and competent sources commending its adoption.

Special attention has been given to the memorandum directing the use of the Delco system in the first 20,000 Liberty motors. In the first memorandum by Major Gray, Chief of the Specification Section, under date of October 6, 1916, the accessories recommended were so placed that the Delco ignition came last on the list. This was then rearranged, apparently to attract less attention to Delco, in alphabetical order. The recommendation, Major Gray testifies, for the use of the Delco system and the other accessories specified came from Major Vincent, one of the designers of the Liberty motor and then executive officer of the Aeroplane Experimental Department of the Equipment Division, who stated that he did not believe they would be justified "in specifying for quantity production any other accessories than those which had thus far been tested out satisfactorily." The situation was a delicate one, says Major Gray, as Major Gray himself had been president of the Hess Bright Company (he had resigned his office and disposed of his holdings in June, 1917), whose ball-bearings were required as one of the accessories, and Colonel Deeds had developed the Delco system. Major Gray testifies that he brought the question to Colonel Deeds' attention, who said, "I do not like really to have anything to say about it, because in that list is the Delco ignition and

if I authorize it it will look as though I have an axe to grind." The sum of the matter is that there is no satisfactory evidence that Colonel Deeds signed, prepared or directed the order for the use of the Delco ignition, although it cannot be doubted that he desired the system to be used. Nor is there evidence that any recommendation was made by Colonel Deeds to the Aircraft Board or to any other council, board or commission regarding the matter.

His statement to the Aircraft Production Board on August 28, 1917, that he had made a *bona fide* transfer of all his stock in the United Motors Corporation, when the stock had not in fact been transferred and at most he contemplated a gift of the stock to his wife, was neither candid nor truthful, and is certainly not to be regarded as a "full and complete disclosure." But in the absence of proof of solicitation, inducement or recommendation by him, or action on his part as an officer or agent of the Government in transactions with the United Motors Corporation or the Delco Company, there are no facts bringing the case within the statutory prohibition.

Domestic Building Company

In his letter of August 28, 1917, to the Aircraft Production Board, Colonel Deeds stated that he had made a *bona fide* transfer of his stock in this company. This was not true. It appears that on that date he resigned the office of President of the company, but he did not dispose of his stock. The stock of that company is still held in equal portions by Deeds and Kettering.

Colonel Deeds was plainly led to make the statement in his letter by the fact that the Domestic Building Company had acquired the land and had erected the building which was in course of completion, and was then occupied and intended to be used as the principal plant of the Dayton Wright Aeroplane Company for the manufacture of aeroplanes. It is said that in anticipation of a lease of the property to the Dayton Wright Aeroplane Company, it had been agreed prior to August 28, 1917, that Deeds' stock in the Domestic Building Company should be sold to Kettering. But there is not sufficient evidence of a definite and binding agreement to that effect, or of anything more than a loose understanding between intimates, whose arrangements could at any time be adjusted to suit their mutual convenience. Certainly, there had been no transfer of the stock. It was not until November that there was an adjustment of accounts with this company, and then, instead of a sale of his stock by Deeds, he retained his stock in the Domestic Building Company and the plant erected by that company was purchased by Talbott, Sr., Kettering and Talbott, Jr., who at once transferred it to the Dayton Wright Aeroplane Company.

On February 4, 1918, the Domestic Building Company made a direct conveyance to the Dayton Wright Aeroplane Company of an additional tract of 8.34 acres, adjoining the first tract, at the price of $13,344, or $1,600 per acre.

However, there is no ground, so far as the retention of Deeds' stock interest in the Domestic Building Company is concerned, for charging a violation of statute. It is not enough that the Dayton Wright Aeroplane Company purchased these properties, or that certain advances by Deeds were taken into account in fixing the purchase price of the main plant, or that both parcels of land were sold at more than the amount they had cost the Domestic Building Company. The Government has never had any contracts with the Domestic Building Company and it does not appear that Colonel Deeds has acted as an officer or agent of the Government in any transactions between the Government and that company. The gratuitous statement contained in his letter to the Aircraft Production Board that he had made a transfer of all his stock in this company may be said to indicate a willingness to state, as an accomplished fact, a transaction which never took place but was merely in contemplation as a step to be taken if deemed to be necessary.

Dayton Wright Airplane Company

Colonel Deeds' statement in his letter of August 28, 1917, that he had never been a stockholder in this company was true. The stock is owned by the Dayton Metal Products Company, and if Colonel Deeds had or has any interest through stock ownership in the profits on its contracts with the Government, this interest must be derived from an interest in the stock of the Dayton Metal Products Company.

His relation to the organization of the Dayton Wright Aeroplane Company is this: It was an incorporator and while he did not subscribe for stock, and none was issued in his name, the payment of the stock of the company to the extent of upwards of four-fifths of its par value was made, in substance, by the transfer to the company of the plant built by the Domestic Building Company owned by Deeds and Kettering, and this company received therefor unsecured notes of Talbott, Sr., Kettering and Talbott, Jr., only a small part of which has been paid. Thus, Deeds and Kettering through the Domestic Building Company virtually furnished the main plant of the Dayton Wright Aeroplane Company on a credit to the Talbotts and Kettering. The transaction was as follows:

The aeroplane factory was erected on a tract which the Domestic Building Company had acquired from the Moraine Development Company (a corporation in which Deeds and Kettering were largely interested) at a price a little over $753 an acre. The building was intended for the use of the Domestic Engineering Company, another concern owned by Deeds and Kettering, which was engaged in the business of supplying Delco lights for general illuminating purposes. It was later decided that it should be used by the Dayton Wright Aeroplane Company, which entered into possession. Still later, it was arranged that the syndicate composed of Talbott, Sr., Kettering and Talbott, Jr., should purchase the plant from the Domestic Building Company and convey it to the Dayton Wright Aeroplane Company. In November, 1917 (while the building was still incomplete), Mr. Allan R. Smart, a public accountant (of Barrow, Wade, Guthrie & Company) made an adjustment of the accounts of Deeds, Kettering, Talbott, Sr., and Talbott, Jr., for various advances, and a balance was struck of $683,732.16 as owing to the Domestic Building Company. In this adjustment, the land (25.55 acres) was taken at $1,200 an acre and the building at the amount of the expenditures upon it, making the price of the plant (called the Moraine plant) $836,401.08. The balance of $683,732.16 was covered by three individual notes of Talbott, Sr., Kettering and Talbott, Jr., in the proportion of two-fifths, two-fifths and one-fifth, as follows: H. E. Talbott, $273,492.87, C. F. Kettering, $273,492.87, and H. E. Talbott, Jr., $136,746.43. All of the notes were dated November 4, 1917, and were payable to the Domestic Building Company one year after date with 6 per cent. interest. The notes are unsecured. the makers of the notes have paid interest quarterly; and, in addition, Talbott, Sr., has paid $3,492.87 on the principal of his note, reducing it to $270,000, and Talbott, Jr., has paid $26,746.43 on the principal of his note, reducing it to $110,000. It appears that Mr. Kettering has made payments of $6,000. This transaction left the Talbotts and Kettering as the owners of the Moraine plant, which the Dayton Wright Aeroplane Company was operating, and the stock of the Dayton Wright Aeroplane Company for which they had subscribed had not been paid in.

The payment of the subscriptions for the stock of the Dayton Wright Aeroplane Company, the concurrent payment by that company for two plants (the Moraine plant, already mentioned, and another at Miamisburg), and the transfer of its stock, thus paid for, to the Dayton Metal Products Company were effected by an exchange of checks on December 1, 1917. Shortly before, the Miamisburg plant had been acquired by Talbott, Sr. (for the syndicate) for the sum of $60,000 and was turned over to the Dayton Wright Aeroplane Company at $127,202, the profit being divided between himself, Kettering and Talbott, Jr., according to their respective interests in the syndicate. To accomplish the desired result, the following procedure was adopted:

The Dayton Wright Aeroplane Company gave to the syndicate its check for the sum of $955,071.25, made up of the purchase price of the Moraine and Miamisburg plants ($836,401.08 less an item of interest ($8,531.83) for the Moraine or main plant and $127,202 for the Miamisburg plant). The Dayton Metal Products Company gave its checks to the syndicate for $173,459.55, for various balances of accounts, and for $999,500, the purchase price at par of the stock of the Dayton Wright Aeroplane Company (less five shares retained). The syndicate thus received checks to the aggregate amount of $2,138,030.80. The syndicate gave their check to the Dayton Wright Aeroplane Company in payment of the capital stock of $1,000,000 and another check to the Dayton Metal Products Company for $1,136,537.20 as the purchase price of certain securities which the Dayton Metal Products Company sold to the syndicate, making the total of the syndicate's checks $2,136,-537.20. The Dayton Wright Aeroplane Company gave its check to the Dayton Metal Products Company in repayment of advances for $44,-928.75, the difference between the sum of $955,071.25 paid by the company for the plants and the sum of $1,000,000 received for its stock. The transaction was accomplished with a minimum use of cash (less than $1,500), and as a result the Dayton Metal Products Company had all the stock (save five shares) of the Dayton Wright Aeroplane Company; the Dayton Wright Aeroplane Company had the Moraine and the Miamisburg plants; Messrs. Talbotts and Kettering had the securities which they had purchased from the Dayton Metal Products Company; and the Domestic Building Company (owned by Deeds and Kettering) continued to hold the notes which the Talbotts and Kettering had given to that company on the settlement in November.

On the transfer by the syndicate of the shares of the Dayton Wright Aeroplane Company to the Dayton Metal Products Company it was agreed that all dividends in excess of 7 per cent. per annum on the transferred stock, and in excess of 8 per cent. per annum on the common stock, should be paid to Talbott, Sr., Kettering and Talbott, Jr., in the proportion of two-fifths, two-fifths and one-fifth. Why they should have desired these profits to be divided in the syndicate proportions instead of taking the profits through their dividends, in the proportions in which they held the stock of the Dayton Metal Products Company, the purchaser of the shares, has not been made clear. The Talbotts and Kettering also took an option from the Dayton Metal Products Company to repurchase all the shares at any time within five years for the sum of $999,500.

Dayton Metal Products Company

Colonel Deeds originally held one-fourth of the stock of this company, or 500 shares. It appears from the minutes of the Board of Directors that at a meeting of the Board in Dayton, on May 21, 1917, President Talbott stated that the company had been advised by the Ordnance Department of the Army "that, in all probability, the entire facilities of the company would be utilized for munition work, and, in all probability, contracts would be given to the company as soon as appropriations were made by the Government." It is further set forth "that Mr. E. A. Deeds explained that he had been called to Washington and requested to take place on some of the committees of the Council of national Defense; that he had been to Washington and that he had accepted the call, and he therefore desired it that he might act as uninterested, directly or indirectly, in any manufacturing plant which was contemplating business with the Government, and that he desired to offer his resignation as Vice-President and as director of the company." The minutes show the acceptance of this resignation and that Mr. Kettering was elected Vice-President. The minutes of the meeting of May 21, 1917, conclude with the following statement:

"At this meeting Mr. Deeds offered for sale and discussed probable purchasers for his stock in the Dayton Metal Products Company, and Mr. Deeds offered to the directors his entire holdings of stock at its book value less 15% to cover costs and probable losses in view of the possibility of no future Government contracts being secured and the business of the company would have to be readjusted into lines being developed by the Experimental Department."

Some time subsequently—in the early part of the year 1918—the accountant drew a line across the last-mentioned statement in the minutes. He explains that he did not consider it "a corporate record," but a matter between the stockholders.

The testimony of the parties concerned is that Talbott, Sr., Kettering and Talbott, Jr., purchased all Deeds' shares in the Dayton Metal Products Company at their book value as of May 1, 1917, less 15 per cent. and gave in settlement of the purchase price their notes as follows:

H. E. Talbott	200 shares	$207,706
C. F. Kettering	200 shares	$207,706
H. E. Talbott, Jr.	100 shares	$103,853

The notes were dated May 22, 1917, were payable to Deeds' order one year after date, with interest at 4½%, and were placed in the hands of George B. Smith, the confidential agent of Deeds and Kettering. The notes were wholly unsecured. According to the stock certificate book the old certificates were cancelled and new certificates issued to the Talbotts and Kettering under date of May 22, 1917.

It is not only open to doubt whether the transaction described in the minute book took place on May 21, 1917, but on all the evidence it is reasonably clear that it did not take place on that date. The minutes are typewritten and pasted in the minute book. No one of the parties is willing to testify positively that the proceedings described in the minutes took place on that day. Mr. S. S. King, of the Dayton Lumber & Manufacturing Company, has testified that he and Deeds went to Washington on the same train on May 18, 1917, and that they were in communication every day in Washington, from May 19th to 23d. Furthermore, it appears that on May 21, 1917, when Mr. Deeds is represented as making his statement at the meeting of directors in Dayton, he was making his first appearance, according to the minutes of the Aircraft Production Board, at a meeting held by that Board on that day in Washington. He himself testifies that he was in Washington on that day. While Mr. Deeds is represented as resigning his office as Vice-President of the Dayton Metal Products Company in May, 1917, he continued to draw his salary until the end of June, 1917. The notes were placed in the custody of the confidential agent Smith, but he made no entry in Deeds' bills receivable book of these notes until

September. It does not satisfactorily appear, in view of the nature of some of the items, that the adjustment of accounts in fixing the book value and the determination of the amounts of the notes could have been made before June 30, 1917. There are stock certificates bearing the date of May 22, 1917, and purporting to have been issued after the issue of the new certificates to the Talbotts and Kettering for the Deeds' shares, but these certificates were issued to members of the Talbott family dividing the shares he had formerly held.

Upon all the evidence, it is not established that the stock was purchased as early as May 22, 1917, and there are many indications that the transaction was dated back to that date.

However, Colonel Deeds' stock was actually transferred on the books of the company, and the notes dated May 22, 1917, were given, apparently not later than September, 1917.

On December 31, 1917, interest was paid by the makers on their respective notes to that date; and interest was paid quarterly thereafter. On January 18, 1918, Talbott, Sr., paid $7,706 on account of the principal, reducing his note to $200,000; in February, 1918, Talbott, Jr., paid $3,853 on account of the principal, reducing his note to $100,000, and on September 11, 1918, Kettering paid, on account of his note, the sum of $10,000.

If the transaction was a *bona fide* sale of the stock Colonel Deeds thereby parted with all his stock interest in the Dayton Metal Products Company and thus did not have, by virtue of an interest in that stock, an interest in the profits of the Dayton Wright Aeroplane Company. The parties all deny that there is any secret agreement or option or understanding of any sort for a retransfer of the shares to Colonel Deeds, or for a sharing of profits with him.

To conclude: The fact is that the transfer of the shares in the Dayton Metal Products Company, which owns the stock of the Dayton Wright Aeroplane Company, was made to Colonel Deeds' intimate business associates on their unsecured notes, which are overdue and unpaid save to a small extent. But there is no proof upon which it can be charged that Colonel Deeds retained an interest in the Dayton Metal Products Company and thereby in the Dayton Wright Aeroplane Company.

Other Aviation Activities Centered at Dayton

The Wilbur Wright Field

This is a tract of about 2,245 acres leased to the Government by the Miami Consservancy District, of which Mr. Deeds was the head. It was a portion of the area selected by the Miami Conservancy District for the impounding of waters in the event of a serious flood. The property was acquired by the Government for a flying field and was developed by the erection of hangars, barracks, a store-house and other structures. Upwards of $3,000,000 has been expended by the Government in this development.

On April 30, 1917, Major (now General) Foulois was directed to inspect land sites for aviation purposes at various places, including Dayton, and several tracts at Dayton were examined by him and by Captain (now Colonel) Edgar on May 8. These officers were met at Dayton by Mr. Deeds and both Deeds and Orville Wright accompanied them on their inspection of the tracts in the vicinity. As to these, on May 11, 1917, Major Foulois reported as follows:

"The largest tract of land inspected is about ten miles from Dayton and contains about 4,000 acres. This tract of land is admirably suited for aviation purposes, is under the control of the Conservancy directors and any portion of it can be acquired by the Government at a very low cost. The purpose for which this land has been set aside by the State of Ohio makes it extremely desirable for aviation purposes, in that it will be always used for agricultural purposes only and no buildings or other obstacles will ever be erected within the area set aside. Options on this tract of land or any portion thereof will be mailed to this office within the next few days."

On May 15, 1917, General Squier recommended that the approval of the Secretary of War be obtained for the rental of several aviation training sites, including the one at Dayton which was thus described:

"Approximately 2,500 acres in the vicinity of Dayton, Ohio, at the rate of $17,500 per year with the privilege of renewal for three years and the option of purchase at $350,000, the cost of crop destruction being $75,000. This will provide a four-squadron training field."

Mr. Coffin, as Chairman, endorsed the proposal, stating that it was "in the judgment of the Committee a wise and necessary action," and the project was approved on behalf of the Secretary of War by the Acting Chief of Staff. On May 19, 1917, General Squier authorized Captain Edgar to lease this site and others, and to proceed with the contracting for the necessary buildings. The first lease was signed on May 22, 1917, (by Captain Edgar for the Government and Mr. Deeds for the Conservancy District) for 2,075 acres for the period ending June 30, 1917, at the rental of $2,000, the Government also agreeing to pay $73,000 to cover damages to crops. There was an option for renewal for the year beginning July 1, 1917, at the rental of $17,600, and for a further renewal for the year beginning July 1, 1918, for a tract containing 2,500 acres (including the 2,075 acres first mentioned) at a rental of $20,000, and for further annual periods ending July 1, 1922; and there was also an option to purchase the 2,500 acres for $350,000. Of the proposed tract of 2,500 acres, 505.27 acres were found to be marshy and were withdrawn and 250.47 acres, said to be of equal value, were added. This left a tract of 2,245.20 acres, for which a new lease was executed on July 1, 1917, for the period ending June 30, 1918, at the rental of $18,404.59, with annual options of renewal at a rental of $20,000 until June 30, 1922, with the option to purchase at the same price. The rental for the first year is explained by the fact that there were 210.47 acres of which possession could not be taken until March 1, 1918. Soon after that date the Commanding Officer at the field stated that 34.94 acres were in the possession of the Government, but that the remaining acres were available for occupancy but "were very low and swampy and in the present condition of no value to the Government." For the Miami Conservancy District it was stated that it had settled with the tenants at considerable expense in order to get possession and it was unwilling to take back the land from the Government.

There is an adjoining tract of 32 acres (part of the original 2,500 acres) which with 8 acres additional were sold to the Government as a site for a warehouse.

It appears from the testimony of Ezra M. Kuhns, the Secretary of the Miami Conservancy District, that at the time of our entry into the War the District had been able to secure options on only about 300 acres of the tract in question, but when negotiations with the Government began there was swift action. Mr. Deeds had brought the matter to the attention of Mr. Waldron as early as April 24, 1917, and had sent to him one of the District's engineers with maps. The following telegrams show the activity of Deeds and Talbott:

Telegram Deeds to Kuhns, April 30, 1917:

"Washington. D. C., April 30, 1917.

"Ezra M. Kuhns,
Miami Conservancy District,
Dayton, Ohio.

"Subject of our trip yesterday moving very rapidly and very satisfactorily. There is no doubt in my mind but what we will be successful. Avoidance of publicity very essential. Inspection will be made end of this week or first of next. You and Morgan* must plan now as though it was decided. E. A. Deeds."

Telegram Deeds to Kuhns, April 30, 1917:

"Washington, D. C., April 30, 1917.

"Ezra M. Kuhns,
Miami Conservancy District,
Dayton, Ohio.

"Options should be rushed in the vicinity of Fairfield raising the price if necessary. E. A. Deeds."

Telegram Deeds to Kuhns, April 30, 1917:

"Washington, D. C., April 30, 1917.

"Ezra M. Kuhns,
Miami Conservancy District,
Dayton, Ohio.

"Ohio State University is ordered to-day to cooperate with the Dayton School and Magruder Lord and Knight instructed to report at Camp Gorden, Canada, Monday to learn course of instruction. Publicity will follow these instructions, and no one outside of Signal Corps officers know of our plan for the larger school, and so far as everyone is concerned Dayton School is the Wright field civilian school. Think you should advise Wright Morgan Harold Talbott and Kettering, so that they will not disclose anything inadvertently. The civilian school will continue, regardless of what is done with the other plan, and Ohio state will give the preliminary instruction in military tactics and all class room work, while the Wright Field Company will give the instruction in aviation. Harold Talbott should be the channel through which publicity is given out, and there is no objection using the last statement if called upon. E. A. D."

Telegram Deeds to Talbott, May 11, 1917:

"Washington, D. C., May 11, 1917.

"H. E. Talbott,
Dayton, Ohio.

"Think your whole plan ideal.

E. A. Deeds."

Telegram Talbott to Deeds, May 11, 1917:

"May 11, 1917.

"E. A. Deeds,
Care New Willard,
Washington, D. C.

"Contracts remaining secured to cover twenty-five hundred acres will be closed by tomorrow evening. Will start Monday on immediate possession of land so the fields will be ready when buildings are finished. This applies to central one thousand acres in front of buildings. Builders may retain use of buildings and barns for a few months and in some cases until winter, but main fields must be prepared without delay if they are to be used this fall. Think best to give no reason for immediate possession and feel sure we can arrange it. We can arrange financial matters as suggested. Wire if you approve.

H. E. Talbott."

Telegram Deeds to Talbott, May 11, 1917:

"Washington, D. C., May 11, 1917.

"H. E. Talbott,
City National Bank Building,
Dayton, Ohio.

"With few exceptions owners can, if necessary, continue to live in their houses for a year thus avoiding necessity of moving this summer. Their teams will be employed, giving revenue to them. District wants to try out flying on large scale and wants to try experiment at once. This is only a suggestion. You doubtless may have a better one. May be necessary to exercise option at once, and if so I will gladly go on District's note for full amount.

E. A. Deeds."

Telegram Deeds to Talbott, May 12, 1917:

"Washington, D. C., May 12, 1917.

"H. E. Talbott,
City National Bank Building,
Dayton, Ohio.

"Suggest Kuhns Emmett Grant and Brown be here Monday morning for conference on conservancy bringing description of entire twenty-five hundred. Tax value and tax rate of property under discussion. Will be helpful. Publicity can be delayed at this end without difficulty. Everything moving nicely.

E. A. Deeds."

The partiality for this site does not appear to have been warranted by any advantages it can be said to possess. Indeed, no satisfactory reason appears for the securing of so large a tract, as apparently 1,400 or 1,500 acres would have answered the purpose.

Fields of about 650 acres were selected at Rantoul and Detroit for two-squadron fields, and the field at Dayton was for four squadrons. Both the leasehold interest and the option to purchase are subject to a flood easement. The evidence is that in case of a flood such as that of the year 1913, the impounded water (that is, after the completion of the dam which it is understood will be completed in two or three years) would cover the lowland to a depth of about forty feet; the lowest hangar would have twenty-four feet of water, that is, over the eaves, and the highest hangar would have thirteen feet of water. The barracks and various buildings which stand on higher ground would not be seriously affected. The warehouse itself (a large structure) is in a dry place, and the suggestion that some of the property stored there during the past year has suffered from moisture is not supported. Aside from the consequences of flood in the Miami Valley and the use of the area as a detention basin, it should be added that a considerable part of the tract consists of swamp land which is unsuitable for the use for which it was leased.

There is no evidence that Deeds himself had any interest in the land acquired. He was head of the Miami Conservancy District, but this was a public enterprise not organized for profit. Apparently, at an earlier period, advances had been made by the Dayton Metal Products Company (a portion of which had originally been charged to Deeds personally and later credited back to him and charged to the maintenance account of the company) which had been used for the purchase of options for the District. The result of this transaction was to leave the Dayton Metal Products Company a creditor of the enterprise but without interest in the land. Mr. Deeds had been appointed on the Munitions Standards Board in March, 1917, and he accepted appointment on the Aircraft Production Board on May 11, 1917. At this time, however, he was acting only in an advisory capacity and it was before the passage of the Act of August 10, 1917. He testifies that his only interest in this project was as a citizen of Dayton.

*Morgan was the engineer of the Miami Conservancy District.

The Contract for the Development of the Wilbur Wright Field

The next step was the placing of the contract for development. The contract was signed by Captain Edgar under the direction of the Chief Signal Officer, and its terms were not unreasonable. It was on a cost-plus basis with a sliding scale, which as applied to the amount actually expended gives the contractor a commission of seven per cent. with a maximum limit of $140,000. The contractor, the Dayton Lumber and Manufacturing Company, was recommended by Deeds. This Company has done nothing in an extensive way for several years, having been engaged since the year 1908 in selling material and in operating a planing-mill and a lumber-yard. Its capital stock was $75,000. Prior to April, 1917, one S. S. King had owned 117 of the 750 shares. King's holdings were then increased to 417 shares, and in acquiring these 300 shares King was backed by H. E. Talbott, who as President of the City National Bank of Dayton arranged for a loan of $60,000 for the purpose. King wrote Talbott on April 25, 1917: "As to the ownership of the stock, if you see fit to back me in it this can be determined in any manner that you see fit." It was not long after the control of the Dayton Lumber and Manufacturing Company was thus acquired that the arrangement was made for giving to this Company the contract to develop Wilbur Wright Field. King's narrative of the circumstances in which this contract was obtained is very illuminating and affords a notable contrast to the difficulties of many who unavailingly sought contracts with the Government.

King was sent for by Talbott and informed that he (King) had been "recommended down at Washington to assume the responsibility of putting up some buildings for Wilbur Wright Field," and suggested that he immediately set about effecting an organization for the purpose. This was on Saturday, May 17, 1917, and on Sunday Talbott telephoned to King, asking him to leave immediately for Washington. Accordingly King went to Washington on Sunday afternoon, taking the same train with Deeds. It was arranged that King should call the next day at Deeds' office, which, he was informed, was on the same floor with that of the contracting officer, Captain Edgar. Accordingly on the following day, May 19th, Deeds introduced King to Captain Edgar and in two or three days, on May 23rd, the contract was signed. As Colonel Edgar testifies: "King was brought down here by Colonel Deeds and recommended to us as a proper contractor, the most available in Dayton for the work."

The following is a portion of the correspondence between Deeds and Talbott relating to this contract:

Telegram Deeds to Talbott, May 23, 1917:

"Washing on, D..C., May 23, 1917.

"H. E. Talbott,
City National Bank Building,
Dayton, Ohio.

"King probably returns to Dayton this evening. He is undertaking something which he alone is unable to get through with. It will be important that you give him a vision of this job and some very definite suggestions how to hit it in a big way. This is the biggest undertaking that has ever been put across in Dayton.

E. A. Deeds."

Telegram Deeds to Talbott, May 23, 1917:

"Washington, D. C., May 23, 1917.

"H. E. Talbott,
Dayton, Ohio.

"Suggest you personally direct publicity regarding contract to be given soon, so that it will avoid criticism and at the same time tell the story. This is particulary vital because of Captain Waring to start work Friday and the visitors whom I am bringing, who may read the papers. Your good judgment is needed on this.

E. A. Deeds."

Telegram Deeds to Talbott, May 24, 1917:

"Washington, D. C., May 24, 1917.

"H. E. Talbott,
City National Bank Building,
Dayton, Ohio.

"In arranging for contract do not overlook a local contractor and lumber man in Osborne. Ezra Kuhns knows his name. He has been friendly to us and I promised him something to do on this job.

E. A. Deeds."

Telegram Talbott to Deeds, May 28, 1917:

"May 28, 1917.

"E. A. Deeds.
Care New Willard,
Washington, D. C.

"Just to remind you chartered accountants of Government selection, expense to be paid by contractor and charged to cost of work. Piece work for labor only on various unit sections in various classifications of work, will do much towards speed and economy. Each individual transaction to have the approval of officer in charge before it is effected.

H. E. Talbott."

Telegram Deeds to Talbott, May 31, 1917:

"May 31, 1917.

"H. E. Talbott, Sr.,
Dayton, Ohio.

"Wire what progress has been made on Dayton field. This is for our report to the council. If foundations have been started for instance and how many men on the job. This only needs to be a rough estimate.

Deeds, Aircraft Production Board."

Telegram Talbott to Deeds, June 1, 1917:

"June 1st, 1917.

"Deeds,
Aircraft Production Board,
United States War Department,
Washington, D. C.

"Steam shovel and large trench digging machine now in place. Three cutting gangs at work. Teams and tractors on ground. Carpenters finishing sheds and office for construction purposes. Foundation excavations in progress. Have plant and equipment for six concrete gangs which will at work early in the week. Sidewalks progressing. Repairing highways to facilitate trucking operations from Dayton. Purchased five new Packard trucks to augment transportation over the existing available trucks. Next week will see everything booming along. All material lumber cement planks board roofing located and on the way. Wish you would think over method of authority which can be given me to rush transportation of railway cars. This looks like the main point of congestion. All departments of construction now organized with experienced and competent supervisors and foremen. All this in spite of the fact that it has rained every day since Waring has been here.

H. E. Talbott."

Despite the indications of these messages and of his transactions with King, Mr. Talbott testifies positively that he had no interest in the enterprise, except as a citizen of Dayton and got nothing out of it beyond 6 per cent, interest received by the Dayton Metal Products Company on money loaned.

King had no capital available for the enterprise, nor had the Dayton Lumber and Manufacturing Company. King's testimony is:

"Q. Did you have the capital to swing that? A. Not without assistance.

"Q. Where did you expect to get the assistance? A. When I talked to Mr. Talbott he told me on the Saturday afternoon, I said, 'Well, this will take a good deal of money.' He said, 'Yes, but', he said, 'you need not worry about that. We will work out some way for that.' He said, 'I do not know how we will work it out, but we will work out some way for that'."

The financial assistance that King needed was obtained upon the credit of the Dayton Metal Products Company, supported by the personal guaranties of H. E. Talbott and C. F. Kettering. Notes of the Dayton Lumber and Manufacturing Company to the extent of $400,000 were discounted by the Dayton Metal Products Company with the American Exchange National Bank of New York. It was originally contemplated that these notes should be endorsed by Deeds and Talbott, as is shown by the following extract of a letter to Mr. Talbott from W. H. Bennett, Vice-President of the American Exchange National Bank, under date of June 25, 1917:

"Referring to the conversation which the writer had with you on Thursday, I have conferred with Mr. Kenzel, Assistant Cashier of the Federal Reserve Bank, and upon your statement that the Dayton Lumber and Manufacturing Company is under contract with the United States Government for the preparation of the aviation field at Dayton, and that said company is to receive payments on the tenth of each month on the presentation of receipted vouchers for work completed in the previous month; and that it is the intention of the Dayton Metal Products Company to make advances to said Dayton Lumber and Manufacturing Company of amounts necessary to carry on the work, he ruled that the paper executed by the Dayton Lumber and Manufacturing Company and endorsed by the Dayton Metal Products Company to cover said funds so advanced will be eligible for rediscount with the Federal reserve bank.

"Therefore, we feel that it will probably be of mutual advantage to provide for the advance of $400,000 requested from us by a three months' note executed by the Dayton Lumber and Manufacturing Company, to the order of the Dayton Metal Products Company and endorsed by Mr. H. E. Talbott and Mr. E. A. Deeds. If you so desire, the endorsement of the individual can be secured by an assignment from the Dayton Metal Products Company of certain securities now in safe keeping with us to the individuals referred to."

It was subsequently arranged that the endorsements should be those of Talbott and Kettering, who also gave their separate agreement of guaranty. The avails of discounted paper were passed by the American Exchange Bank to the credit of the Dayton Metal Products Company. It appears from the accounts between the Dayton Lumber and Manufacturing Company and the Dayton Metal Products Company that, while the latter company ultimately paid the notes, their proceeds were used in large part from time to time for the benefit of the Dayton Metal Products Company.

The credit to the Dayton Lumber and Manufacturing Company, thus extended to it upon its notes, was furnished without security, or, as Mr. Talbott put it, with "no further security except in the man (King). I trusted the man; I knew his contract." After the contract had been obtained, King increased his stockholdings in the Dayton Lumber and Manufacturing Company by the purchase of 104 additional shares, borrowing for the purpose $20,000 from the Dayton National Bank.

It appears that the total amount paid by the Government under the contract with the Dayton Lumber and Manufacturing Company, to August 14, 1918, amounted to $3,115,161.94. This represents the amount paid for the cost of the work, that is, for lumber, materials, etc. The commission or profits of the contractor, which had been paid to that date, amounted to $102,436.04. There has been considerable trouble in connection with the contract, and the accounts are far from being in satisfactory shape. An audit of the books of the company was made by Barrow, Wade, Guthrie & Co., to November 30, 1917. They reported that they found "the payrolls very incomplete, full of errors, corrections and erasures" and that there was "abundant evidence that great laxity and carelessness has been exhibited by the employes of the company, especially those in the paymaster's department." These statements are amply confirmed by the evidence in this investigation, and the accounts are in course of being reaudited by Government accountants. The consideration of the various irregularities in the accounts and of the questions to which they give rise must await the result of this examination. It will be observed that the Government has withheld a large part of the compensation of the contractor until a satisfactory adjustment has been made. Of the profits received from the Government, it would appear that the moneys have been retained in the business of the Company, except to the extent of a dividend of $37,500, that is, 50% on the capital stock. Of this dividend, King was entitled, on the 521 shares acquired in his name, to $26,050 and of this amount it appears that he had received 70%, or $18,235, to July 1, 1918. He had paid $11,000 on account of his loan ($21,000) to the Dayton National Bank. He had paid nothing on the $60,000 loan from the City National Bank. No agreement has been proved for a division of profits on this contract, and there is no proof that Colonel Deeds has had an interest in the contract or in the Dayton Lumber and Manufacturing Company. Even if it appeared that the Dayton Metal Products Company was interested in the contract (which would explain transactions otherwise difficult to understand), this fact would not affect Colonel Deeds unless he were found to be interested in that Company. The question would thus come back to the transfer of his stock in the Dayton Metal Products Company, which has already been considered.

McCook Field (formerly known as North Field)

This is a field of approximately 200 acres in and adjacent to Dayton, which was leased by the Government from the Dayton Metal Products Company, and has been used for the purpose of making various tests. Lt.-Col. Vincent first suggested another field (South Field or Moraine Field) and brought the matter to the attention of Colonel Deeds by whom that field was principally owned. On September 27, 1917, Colonel Deeds sent the following telegram to Mr. Talbott:

"Washington, D. C., September 27, 1917.

"Mr. H. E. Talbott,
City National Bank Building,
Dayton, Ohio.

"Colonel Clark takes letter regarding Moraine flying field with him to Dayton to-night. George McCann has another letter, for Mr. Kettering. Government will lease land, put up buildings and operate experimental field. Lease will be for three years without privilege of purchase, as that is not necessary. Have complete description of property prepared, also statement of cost of buildings already erected and suggested monthly rent arrangement and have George McCann bring them to Washington to complete lease. Have him prepare deed for this property to Mr. Kettering, who in turn, will lease it to the Government.

Deeds, Equipment Division."

Talbott and Kettering refused to consent to this use of South or Moraine Field, as it was said to be needed for experimentation in con-

nection with the Dayton Wright Airplane Company, and they suggested North Field, or what afterwards became known as McCook Field. The latter tract had originally been purchased by Deeds and Kettering, each of them bearing one-half of the cost, and they had made some improvements such as levelling, removing trees, etc., and had erected one or two small buildings. The object of their purchase had been to develop a training field for aeroplanes, to be used by civilians, but this project could not be carried out. The suggestion was that this parcel, with approximately 82 acres of land adjoining which was owned by the Dayton Metal Products Company, would be suitable for the Government's use as an experimental station. Deeds did not wish to be a party to the lease, and conveyed to Kettering his undivided one-half interest in the parcel owned by them in common, and Kettering then conveyed that parcel to the Dayton Metal Products Company which thereupon leased the entire tract to the Government.

The lease was dated October 4, 1917. Colonel Deeds was present at the conference at which the terms were settled and sent the following telegram to Talbott on October 3rd:

"Washington, D. C., October 3, 1917.

"Mr. H. E. Talbott,
City National Bank Building,
Dayton, Ohio.

"Have worked out a lease for the North Dayton field twelve thousand eight hundred dollars a year without cash payment. It is the best thing that can be done under the circumstances and suggest its acceptance. Craighead will discuss it with you in detail when you see him.

Deeds, Equipment Division."

Lt.-Col. Edgar, under the authority of the Chief Signal Officer and the approval of the Chief of Staff and of the Assistant Secretary of War, signed the lease on behalf of the Government. The rental is at the rate of $12,800 a year with an option of renewal from year to year, until June 30, 1921. There is no option to purchase; the lessor agrees that at the expiration of the lease the lessee may remove the structures and improvements erected by it upon the premises.

The contract for the development of the field was made with the Dayton Lumber and Manufacturing Company, notwithstanding the fact that the contractor had failed to give satisfaction in connection with the Wilbur Wright Field. This is explained by Colonel Edgar as follows:

"We had an organization at the Wilbur Wright Field. We had practically reorganized King's force, and it was determined to take them over to McCook Field, which was brought to us by Colonel Deeds as a rush job which must be done immediately. . . . He personally brought the proposition to me as a proposition that had to be put through immediately. They had no place to test the planes that were coming out. We did not pick out McCook Field; we had nothing to do with its location. A contract was made for the rental of the ground of the McCook Field, and we were importuned to take our organization over there with this contractor and finish this job up and it was done.

"Q. Importuned by whom? A. By Colonel Deeds."

The total amount expended by the Government upon McCook Field, to August 14, 1918, amounts to $949,085.35, and the contractor's compensation is seven per cent. of the cost with a maximum limit of $46,200. The amount paid, to that date, as contractor's profit was $26,667.65. The remaining portion of the total compensation has been withheld awaiting the audit of the contractor's accounts.

There is no proof that Colonel Deeds has had an interest in the contract for the development of this field. Nor does it appear that he had an interest in the lease executed by the Dayton Metal Products Company to the Government, or in the rent reserved. While Colonel Deeds originally owned a part of the tract leased to the Government, he conveyed—by what purported to be an absolute sale—his interest to Kettering, and was not interested in the lease by Kettering's grantee, the Dayton Metal Products Company, unless he was interested in the stock of that company, a question already considered. It is understood that the amounts advanced by Deeds, in connection with the development of that portion of the tract in which he had an undivided one-half interest, were taken into account in the settlement that was made in November, 1917, when the amount to be paid (by notes) to the Domestic Building Company for the plant acquired by the Dayton Wright Airplane Company was determined; but this fact is not sufficient to establish an interest in the lease so as to bring the matter within the range of the Federal penal statute.

South Field or Moraine Field

This is a tract of about 110 acres lying south of the City of Dayton and a short distance from the plant of the Dayton Wright Airplane Company. The greater portion of the land belongs to Colonel Deeds. It has been improved by the erection of a number of hangers and other buildings. This land was leased about November 30, 1917, to the Dayton Wright Airplane Company for a period of three years, at a rental of $1 per year. It is used by that company as a place of experimentation. The expenditures for hangers and improvements upon South Field which had been made by Colonel Deeds had been taken into account in the settlement made with the Domestic Building Company.

Acceptance Field

This is a field lying close to the plant of the Dayton Wright Airplane Company, upon which the aeroplanes it manufactures for the Government are taken out for trial. The greater part of this field belongs to the Moraine Development Company and it appears that Deeds is interested in this field as a stockholder in that company. Deeds and Kettering each hold 2055 shares, out of a total of 10,003 shares, the majority of the stock being held by Adam Schantz. This field is leased to the Dayton Wright Airplane Company. The transactions relating to South Field and Acceptance Field were with the Dayton Wright Airplane Company and not with the Government.

(3) Colonel Sidney D. Waldon

During the period in question Colonel Waldon was a stockholder in the Packard Motor Car Company. This interest he retained, but he disclosed it to the Aircraft Production Board at its meeting of August 27, 1917, and to the Secretary of War, and it does not appear that he took part at any time in any proceedings of the Board, or in any other transactions, in relation to the Packard Company. No interest on his part in any other concern having dealings with the Government is shown.

(4) Colonel Robert L. Montgomery

At the time Colonel Montgomery entered the service of the Government he was one of the directors of the J. G. Brill Company, of Philadelphia, holding one share of common stock. Colonel Montgomery states that he resigned from the Board of Directors and sold his share of stock on September 22, 1917, before any contract was made by that company with the Government and that he did not negotiate the contracts in which that company is interested. Colonel Montgomery further states that at the time he entered the Government's service it was agreed with his partners that no member of the firm should have any interest in any concern connected with aircraft work. It appears that the wife of one of his partners held for some time 200 shares of the stock of the Curtiss Aeroplane and Motor Corporation, which she had purchased in her own right, and then sold it, and that subsequently she bought some 500 shares of the stock of the Wright-Martin Aircraft Corporation. With these transactions Colonel Montgomery had no connection.

Colonel Montgomery's firm (Montgomery, Clothier & Tyler), in August, 1917, took an interest of $250,000 in an underwriting syndicate through the National City Company for the flotation of $5,000,000 six per cent. notes of the Electric Auto-Lite Corporation. Later, Montgomery, Clothier & Tyler issued a circular offering the notes for sale to the public. These notes of the Electric Auto-Lite Corporation were secured, in part, as the circular states, by a specific pledge of collateral among which were shares, amounting to $12,500,000 in par value, of the common stock of the Willys-Overland Company. The Farmers' Loan and Trust Company of New York was made trustee to receive the pledge. The sale of all the notes was completed by September 12, 1917, $116,000 being sold through Montgomery, Clothier & Tyler, who received $8,500 in settlement of their interest in the underwriting. Colonel Montgomery states that this transaction, with others, was undoubtedly mentioned to him by his partners at or about that time, but that he never saw the circular or had the transaction fully explained to him until May of this year. In August and September, 1917, at the time of this transaction, Colonel Montgomery on behalf of the Government was negotiating contracts with the Willys-Overland Company for the manufacture of engines for training planes. The Willys-Overland Company not only made these contracts, but also had a substantial interest in the Curtiss Aeroplane and Motor Corporation, which at the time had contracts with the Government for aeroplane engines. While the Electric Auto-Lite Corporation was affiliated with the Willys-Overland and Curtiss Companies, the transaction in question concerned the flotation merely of notes of the Electric Auto-Lite Corporation, and the interest of purchascrs of these notes in the stock of companies having dealings with the Government was only through the pledge of the Willys-Overland stock as collateral security. It appears that while Colonel Montgomery's firm took part in the sale of the notes as members of the underwriting syndicate, none of the notes were actually purchased by his firm, either for firm account or for any individual partner, and in these circumstances it is believed that there would be no sufficient ground for holding the above-quoted statutes to be applicable.

Apart from the above matter there is no evidence that Colonel Montgomery has had an interest in, any corporation, association or firm with which he has dealt as an officer or agent of the Government.

OTHER OFFICIALS

Lt.-Col. Jesse G. Vincent

In April, 1917, Mr. Vincent was vice-president of the Packard Motor Car Company in charge of engineering, with a salary of $25,000 a year. Under his contract with that company, made in 1912, he was entitled to subscribe for certain shares of its stock. On August 15, 1917, having resigned his office, he made a settlement with the company, receiving his salary to that date and a bonus of $5,000 for the preceding year's work, and at the same time, through the exercise of his option, he acquired $15,000 of common stock at par which with the stock dividends previously declared thereon gave him approximately 347 shares. He had purchased outside about 82 shares, so that he became a stockholder in the Packard Motor Car Company to the extent of 429 shares of the common stock of the par value of $42,900. This stock he has continued to hold since August, 1917; he has received dividends of 1¾ per cent. quarterly with the exception of one quarter for which a dividend was passed.

From about May 27, 1917, until August 15, 1917, Mr. Vincent, while paid by the Packard Company, was actually at work for the Government in the development of the Liberty Motor. It is said that for this period he was "loaned" by his company to the Government. On September 3, 1917, he received a commission in the Army with the rank of Major and later he was raised to the rank of Lieutenant-Colonel. About July 1, 1917, he was put in charge, as a civilian, of the Engine Design Section of the Signal Corps and he remained in this service after he was commissioned and until October 1, 1917. On the latter date, the Airplane Experimental Department of the Signal Corps was established in charge of Lt.-Col. Clark, with headquarters at McCook Field, Dayton, and Major Vincent was associated with this department as its executive officer with his office at the Lindsey Building, Dayton. On February 6, 1918, he was put in charge of the Airplane Engineering Department at Dayton and in command of McCook Field. He is now in charge of the Airplane Engineering Division of the Bureau of Aircraft Production.

Both before and after Major Vincent received his commission in the Army, he had transactions with the Packard Motor Car Company in which he acted on behalf of the Government. On June 6, 1917, the Aircraft Production Board adopted a resolution which provides, after recitals, as follows:

"Therefore be it resolved, that the Board proceed immediately to secure space wherein to bring together sufficient draftsmen under a competent engineering organization to produce complete designs of 8 and 12 cylinder motors, to be known as the US-8A and US-12A respectively; that the design for the 4 and 6 cylinder motors follow as soon as practicable, these motors to be known as the US-4A and US-6A respectively. These designs and drawings to be made to include the designs and drawings for the special tools necessary to produce the parts of these motors. The Board should undertake to have the parts made wherever in its judgment they can be most quickly and advantageously done and have them sent to Washington and assembled here in space to be secured, parts to be made for Five (5) US-12A and five (5) US-8A.

"And Be It Further Resolved that the Board recommend to the Office of the Chief Signal Officer that the sum of $250,000 be immediately set aside to carry on this work and that a disbursing officer be assigned to handle this fund."

This allotment, or $249,159.10, was paid to the Packard Motor Car Company for drawings, models, tests, etc., and for six US-8A's and five US-12A's which were to serve as standardized engines. No written contract for this work or written order for this work setting forth unit prices or specifying the terms on which the work was to be performed is found in the files of the Signal Corps, and in this respect the proceeding was very irregular. Instead of there being an appropriate agreement or written order, it appears that verbal orders were given from time to time by Mr. Vincent, which, it is testified, were confirmed in conversations with Mr. Deeds.

THE NEWS OF THE WEEK

Pershing Honors Gallant Aviators

Washington.—The Commander-in-Chief of the American Expeditionary Forces, in the name of the President, has awarded the distinguished service cross to the following officers and soldiers for acts of extraordinary heroism: First Lieutenant Joseph C. Raible, 147th Aero Squadron; First Lieutenant Arthur H. Alexander, 6th Aero Squadron; First Lieutenant Donald B. Warner, 96th Aero Squadron; First Lieutenant Alfred A. Grant, 27th Aero Squadron; First Lieutenant Charles W. Drew, 13th Aero Squadron; Second Lieutenant Arthur H. Jones, 147th Aero Squadron; First Lieutenant Walter L. Avery, 95th Aero Squadron; First Lieutenant Fred W. Norton, 27th Aero Squadron; First Lieutenant Robert Fulton Raymond, 27th Aero Squadron; First Lieutenant Louis G. Bernheimer, pilot; Second Lieutenant John W. Jordan, F.A. observer; Second Lieutenant Roger W. Hitchcock, pilot (since reported killed in action); Second Lieutenant James S. D. Burns, 165th Infantry, observer, deceased; First Lieutenant Joel H. McClendon, pilot, deceased; Second Lieutenant Charles W. Plummer, 101st F. A. observer, deceased; First Lieutenant Philip R. Babcock, pilot; Second Lieutenant Joseph A. Palmer, 15th F. A. observer; First Lieutenant Richard C. M. Page, pilot; First Lieutenant John I. Rancourt, 103rd F. A. observer; Lieutenant G. A. Vaughn, Lieutenant T. J. Herbert, Lieutenant M. L. Campbell, Lieutenant L. A. Hamilton, Lieutenant J. A. Keating, Lieutenant H. C. Knotts, Lieutenant H. L. Blair, Lieutenant W. W. Lauer, Lieutenant F. E. Luff, Lieutenant T. L. Moore, Lieutenant J. O. Creech, Lieutenant W. Clements, Lieutenant E. E. McKindley, Second Lieutenant H. Burdick, Second Lieutenant A. F. Diamond, Lieutenant E. W. Springs, Lieutenant G. D. Wicke, Lieutenant Theodore E. Boyd, 88th Aero Squadron; First Lieutenant Charles Raymond Black, pilot; Second Lieutenant Earle W. Porter, observer; Second Lieutenant Dogan H. Arthur, pilot, 12th Aero Squadron; Second Lieutenant Phil A. Henderson, observer, 12th Aero Squadron; Lieutenant Edward Orr, pilot 12th Aero Squadron; Second Lieutenant Byrne E. Raucom, observer, 1st Aero Squadron; First Lieutenant William P. Erwin, pilot, 1st Aero Squadron; Major William Thaw, 103rd Aero Squadron; First Lieutenant Edward V. Rickenbacker, 94th Aero Squadron; First Lieutenant Douglas Campbell, 94th Aero Squadron; Second Lieutenant Ralph A. O'Neill, 147th Aero Squadron; First Lieutenant James A. Meissner, 94th Aero Squadron; Captain David McK Peterson, 94th Aero Squadron; First Lieutenant Frank A. Llewellyn, pilot, 99th Aero Squadron; Second Lieutenant, Roland H. Neel, observer, 99th Aero Squadron; Lieutenant Thomas J. Abernathy, 147th Aero Squadron; Second Lieutenant Alan F. Winslow, 94th Aero Squadron.

Armored Plane Captured

With the American Army Northwest of Verdun.—Americans captured an immense German armored battleplane on Oct. 23 north of Brieulles. The machine was virtually intact, but the pilot and gunner made their escape.

It is supposed that the battleplane was downed a day or two ago by American aviators. Just when the machine landed is unknown. Infantry forces found the monster.

A number of valuable instruments and two machine guns were captured. The battleplane was equipped with a bomb-dropping device, and had a gun and sighting arrangement so fixed that the gunner could see to shoot directly beneath him. This gun was for firing on roads. So far as known this is the first plane of this type captured by Americans. Half the fuselage was covered with quarter-inch armor.

Interned in Holland

The Navy Department is informed that Second Lieutenant Frank Nelms, Jr., U. S. Marine Corps, pilot, and Second Lieutenant John Frederick Gibbs, observer, while flying a navy bombing plane were compelled, because of engine trouble, to land in Holland, where they were interned.

Exploits of Famous Airmen Not Published

London.—British air force authorities do not allow publication of stories of exploits of the most successful British aviators using the names, as in France and Germany, because it is considered unfair to men who are doing fine work, but who have not had opportunities for winning many air victories. Also they say the loss of a famous aviator creates a bad impression if the people at home have been led to believe that he is almost a superman.

This view is also taken by many British flying officers. One of them, recently wrote: "I go into the air perfectly equipped to bring down 'Hun' machines. A pilot on artillery observation or photography work goes up to do a highly necessary job, and perhaps has to spend several hours over it, and in any case has other work to do and cannot go straffing, however much he might like it. Why should I be advertised and glorified any more than he is? We both are trying to do our job, and nobody can do more."

Lieut. Jacques M. Swaab, American Air Service, the newest American "Ace", who downed his fifth German plane on October 31, according to press reports

Doug. Fairbanks Will Help War Fund Drive

Washington.—Douglas Fairbanks, motion picture star, enlisted for the united war work drive. Douglas said he had so much fun raising money for the liberty loan that he is going to jump in and help raise the $170,500,000 for the Y. M. C. A. and the six organizations associated with it.

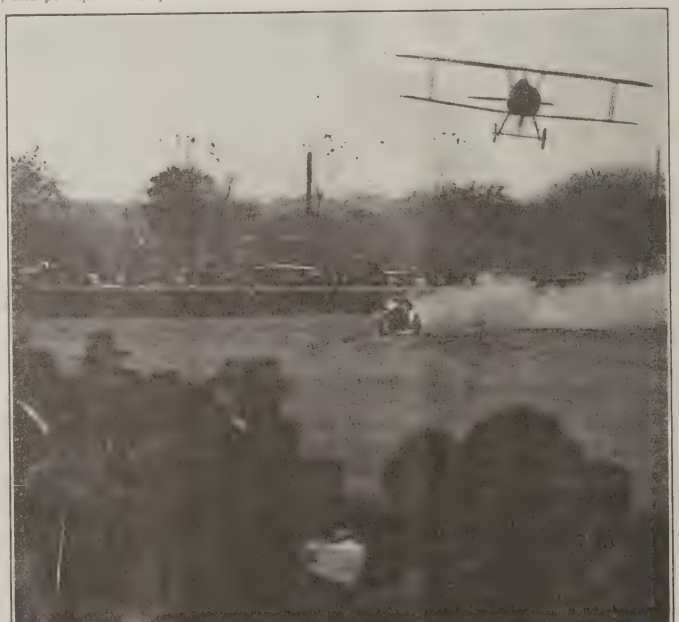
Fairbanks made his announcement in a characteristic way.

"Hey, fellows," he said as a bunch of khaki-clad "Y" men on their way overseas filed through the Willard Hotel. "You are regular guys and I'm going to help raise that hundred million or two to give you a better chance to help our boys over there."

The athletic movie man will be in California during the drive, November 11 to 19. He says he is thinking about "touching" a few western millionaires and flying from California to Washington with the money.

"Aren't you afraid of a hold-up?" he was asked.

"Aeroplane hold-up!" he exclaimed. "Great stuff! That would beat the old stage coach hold-up all to pieces, wouldn't it?"



Anyhow, Douglas says he is going to get the money.

Aeroplane Extras Give Soldiers News

With the American Army Northwest of Verdun. —The men in the most advanced positions on both sides of the lines are reading the newest developments regarding an armistice almost as early as those to whom the daily papers are available. Propaganda officers, both American and German, are using aviators to distribute the notes which have passed between Berlin, Vienna and Washington, and preparations were made to disseminate the news of Turkey's downfall.

Arthur Page and Walter Lippmann are conducting the propaganda from the headquarters in Paris and the details are being carried out by a big force, with which are co-operating the Personnel Staff and Flying Corps.

President Wilson's note to Austria was circulated by the Americans among the Austrian troops within a few hours after it was delivered.

Aeroplane vs. Automobile. Near the end of the race between Louis Chevrolet on his Frontenac racer and Lieutenant E. C. Meaney in a Thomas-Morse scout plane, which was one of the events at the Aero Carnival at Belmont Park on October 26th

Allied Instructors Finish Their Work

During the past fifteen months the American Balloon Corps in France has developed a large number of skilled balloonists, and from now on will be able to furnish experienced men from the front to serve as instructors; for this reason the British Government believes the time has come for this government to relinquish its claims on these men, whom they need in their own service.

Major J. Rutherford Hannay, Captain R. M. A. Edlundh, Captain Robert Wann, and Flight Sergeant H. C. Hill of the Royal Flying Corps, who have been in the United States several months initiating a system of instruction for the Balloon Corps and in procuring and standardizing material, have reported to the Division of Military Aeronautics from balloon fields in various parts of the country prior to returning to their stations overseas.

Lufberry's Sister In War

Lawrence, Mass.—Miss Mary Lufberry, sister of the late Major Lufberry, New England's "Ace of Aces," is going to France. She seeks, in her own words, in some way and to some extent to avenge the death of her brother at the hands of the Hun.

With that object in view Miss Lufberry has been training at the Lawrence telephone exchange preparatory to going to France as an operator. She is confident once she gets there she will find a way to square accounts with the enemy. She feels that even in the humble position of a telephone operator she will be doing something to help cripple her brother's slayers.

24 Psychologists Needed

An unusual opportunity is offered to twenty-four men of limited service classification who have had psychological, physiological and physical training, to enter the air service, according to announcements made by Major Willard Wadsworth, Department Air Service office in Greater New York.

These men are needed for personnel units now being organized, to give tests of aptitude for flying to applicants for training as pilots, observers, bombers and balloonists. They will be sent to the School of Military Aeronautics at Princeton, N. J., for a short course of training before assignment to duty. Candidates should have at least two years of education beyond high school and some laboratory experience to their credit.

Six of the men will be assigned for duty at Princeton. The other eighteen will be sent to San Antonio, Chicago and San Francisco. Application should be made to the Air Service Trade Test Board, 104 Broad street, New York City, room 902.

Roland Garros Killed

Geneva, Switzerland.—The American Red Cross announces that Roland Garros, the famous French aviator, and one of the pioneers in flying in a heavier-than-air machine, was killed Oct. 5, and buried at Vouziers.

Previously it had been reported that Garros was wounded.

Oneonta Field Changed to Ream

As a tribute to the late Major William R. Ream, Oneonta Gunnery School has been changed to Ream Field by order of the Director of Military Aeronautics.

According to unofficial reports great improvements are to be made at Ream Field and it plans are carried out this field will be a close rival of Rockwell Field, although it will still be under the direction of our Commanding Officer, Lieutenant-Colonel H. B. S. Burwell—Rockwell Field Flight.

In 64 Hours in Air Goes 4,000 Miles

Washington.—Lieutenant John E. Davis, United States Air Service, recently travelled 4,000 miles in the air in a zigzag course from the Gulf of Mexico to the Great Lakes, at Mount Clemens, Mich., and return. He was in actual flight sixty-four hours and had many thrills and numerous narrow escapes.

Nine days elapsed from the time Lieut. Davis left Ellington Field, Houston, Texas, until his return. He travelled without a mechanic, did not change either plane or motor, and carried an extra gasoline tank, giving him a capacity of fifty gallons.

He started from Ellington Field Friday afternoon at 1 o'clock, spent the night in Dallas and from there he flew to Memphis. Sunday night at 8 o'clock he made Indianapolis by following the Mississippi north to St. Louis and swinging east by way of Springfield and Rantoul, Ill. There he was forced to take the ground in the dark without landing lights. On Monday he flew to Cincinnati and the following day to Mount Clemens.

On the return trip Lieut. Davis encountered a heavy storm over the Mississippi Valley and fell through it from an altitude of more than 4,000 feet to 300 feet.

Flies 228 Miles in One Hour 45 Minutes

Pittsburgh.—A new record time for an aeroplane flight between Dayton, Ohio, and Pittsburgh was claimed on October 29 by James M. Schoonmaker, Jr., son of the vice-president of the Pittsburgh and Lake Erie Railroad, who covered the distance of 228 miles in a De Haviland battleplane in 1 hour and 45 minutes. An average speed of more than two miles a minute was maintained.

Young Schoonmaker, who is chief engineer of the Dayton-Wright Aeroplane Company, received a long distance telephone message that his father, who just had undergone an operation, was seriously ill. He immediately decided to make a flying visit to his bedside, and obtained permission to use a De Haviland Four battleplane. With Howard Rinehart as pilot he left Wright Field, Dayton, at 11:15 a. m. and landed here at 1 p. m. on Brunots Island.

Schoonmaker said the fastest previous record aeroplane time between Dayton and Pittsburgh was 2 hours and 5 minutes.

American Official

Washington.—Gen. Pershing has cabled the following:

> In spite of poor weather conditions on Oct. 29, our aviators were again active on the front of the 1st Army and shot down three enemy aeroplanes and one observation balloon. All our machines returned.

Washington.—Bombing units attached to the American First and Second armies dropped six tons of explosives on Oct. 30 on Barricourt, Bayoneville and Longuyon, Gen. Pershing reports in his communique.

The evening communique for Oct. 30 reports officially the downing of twenty-one enemy aeroplanes by pursuit squadrons of the First American Army and states that two of the American machines are missing.

Washington.—The War Department received the following from Gen. Pershing on Oct. 31:

> Our pursuit squadrons operating on the front of the 1st Army shot down twenty-one enemy aeroplanes and two observation balloons. Two of our machines are missing.
>
> Yesterday our bombing units attached to the 1st and 2d Armies carried out a number of successful raids, dropping six tons of explosives on Barricourt, Bayoneville and Longuyon.

"With more favorable weather conditions on Oct. 30 there has been increased aerial activity on the front of the First Army throughout the day. Our pursuit squadrons engaged the enemy in numerous combats, in the course of which eighteen enemy aeroplanes were shot down. Five of our machines did not return. Our aviators also carried out important reconnaissance and photographic missions."

Leaps Mile Safely from an Aeroplane

Washington.—It was announced on October 27 by the War Department that Chauffeur R. W. Bottriell of the 145th Air Squadron had performed the feat of jumping successfully with a parachute from an aeroplane at Kelly Field, San Antonio, Tex. The aeroplane was at an altitude of 4,800 feet, almost a mile high, when the jump was made. There was a strong wind blowing, but Bottriell judged his distances nicely and landed safely.

The pilot of the aeroplane stalled the motor slightly just before the jump was made, banking to the right so as to get the tail out of the way of the parachute when Bottriell jumped over the side. A large American flag attached to the parachute during the drop was flying during the descent.

As a result of this test American aeroplanes possibly will be equipped with parachutes as a possible means of saving the aviator in case of an accident.

WATCHING THE AVIATORS AT BELMONT PARK

Left to Right: Alan R. Hawley, President of the Aero Club of America; Colonel F. M. Davis, U. S. A., Mrs. Charles A. Van Rensseleer, Captain Jacques Boyriven of the French Army, and Henry Woodhouse, a Governor of the Aero Club of America, in the official stand at the U. S. Army Aviation Meet at Belmont Park, L. I., Saturday, October 26th

The AIRCRAFT TRADE REVIEW

1,000 Plane Motors Now Made Weekly

Washington.—Production of American aircraft has now reached a state where it is being limited practically only by facilities for transporting the aeroplanes to France. The production of Liberty motors during October reached a stage of 1,000 a week, a goal which had not been hoped for at soonest until December.

The latest official compilations show that since June 1 approximately 2,500 fighting aeroplanes of all descriptions have been shipped to the American forces in France. These 2,500 planes included nearly 150 heavy bombers. The remainder were planes of all classes, including observation machines and day bombers.

Reports from all the production centers show the output is growing rapidly. The American forces have been moving so fast in the last few weeks that it has been found necessary to give up some of the transportation space which was intended for aeroplanes to other material, but within the next few weeks the full movement of aircraft is expected to bein swing again.

Flax Needed in Britain; Linen Used in Aeroplanes

London.—The great development of the aeroplane in war has made linen, and therefore flax, a military material. Before the war Russia supplied three-fourths of the 100,000 tons of flax that British linen manufacturers used every year. Some flax was grown in Ireland, and when the Russian imports ceased Irish flax cultivation was at once taken in hand.

A flax extension committee, which has now developed into the Irish Flax Society, Ltd., took the matter in hand. First a guarantee fund of $2,500,000 to support the campaign was subscribed. More acreage was at once put into flax; the seed was secured from Canada and elsewhere. The result has been that the Irish flax acreage has increased from something over 50,000 acres, two years ago to nearly 150,000 acres, which should bring an increase of 30,000 tons in flax production. This still leaves a shortage of 40,000 tons, which is being made up by importations from British East Africa and from Canada. If the British empire can become self-supporting in the matter of linen materials during the war it will be a lasting trade advantage.

New Aerial Range Finder

By a little instrument attached to aeroplane moving picture cameras, Dr. S. N. Baruch, of San Francisco, says the efficiency of allied artillery will be increased 10,000 per cent. His aerial range-finder has the endorsement of Capt Alter, range expert at Fort Scott, Cal., and former profcssor of astronomy at the State university.

"Existing finders of the latest type establish a range in five seconds," says Dr. Baruch, "but mine is eighty times faster, and therefore adaptable to aeroplanes. This permits allied fliers not only to map enemy country photographically as heretofore, but to establish exact distances between given points, and therefore remove all the guesswork from artillery shooting. The attachment is simple and inexpensive. Though not absolutely perfect as yet, the principle is thoroughly established and the rest is merely a finishing touch."

Dr. Baruch is the inventor of an aerial torpedo which finds its target—the hostile aeroplane—accurately by vibratory attraction, and which is now in the hands of the French army. He has also perfected a depth shell for the destruction of submarines. It is like the depth bomb, but may be fired from a cannon like an ordinary shell.—Washington *Herald*.

Discovers Radium Substitute

Dr. Richard B. Moore, of the United States Bureau of Mines, Golden, Colo., is reported to have announced the discovery of a substitute for radium. Dr. Moore has named the new product mesothorium. Among its uses is in the manufacture and illumination of aeroplane dials and compasses.

Price of $4.50 Per Bushel Set for Castor Oil Beans

The War Department authorizes the following:

In order to procure an adequate supply of castor oil for use in connection with the War Department aviation program, numerous contracts were let last spring for the raising of castor beans in the Southern States, at a price of $3.50 per bushel. With the harvesting of the crop it has been found that this price does not provide sufficient remuneration to the grower.

After careful consideration of the matter by a board of the Bureau of Aircraft Production, Mr. W. C. Potter, the acting director of aircraft production, has established a price of $4.50 per bushel of 46 pounds. As specified in the original contracts, beans are to be delivered hulled and sacked, in carload lots, f. o. b. the nearest railroad station to the land on which they are grown.

Most of the planting of castor beans was done under subcontracts with the general contractors. The price of $4.50 now established is to be paid to the actual growers of the beans. The remuneration of the general contractors for their services in connection with the crop is in addition to this sum.

Dinner to Thomas Morgan

Thomas A. Morgan, contracts manager of the Sperry Gyroscope Company, was the guest of honor at a dinner tendered to him in the state apartment at the Waldorf-Astoria, Manhattan. The dinner was in the nature of a "Good Luck" party, in view of his coming marriage to Miss Diana Yorke of 325 West 83rd St., Manhattan. Mr. Morgan has been associated with the Sperry Gyroscope Company practically since its organization in 1910.

Among those present at the dinner were: J. B. Allen, E. R. Barany, W. E. Brewster, H. Cenarro, P. Colvin, I. Conover, G. P. Casper, C. S. Doran, R. Eberhardt, R. E. Gilmer, J. G. Gates, W. R. Goodman, H. Goodman, F. J. Fannon, B. H. Goldsborough, D. O. Kay, F. T. Kirby, R. E. Kortepeter, M. R. Lott, R. B. Lea, Walter Lunn, J. N. Mahoney, I. H. Mills, F. Colburn Pinkham, M. L. Patterson, E. A. Sperry Sr., E. G. Sperry, E. A. Sperry Jr., Lawrence Sperry, C. E. Scattergood, L. W. Stetson, W. H. Thompson, M. Titterington, F. W. Von Ness, O. B. Whitaker and Paul Willis.

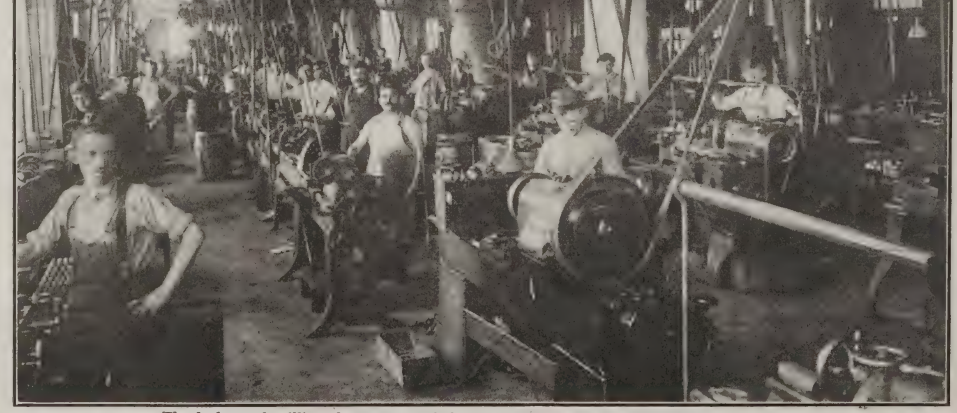
Prices Fixed for Spruce

The Price Fixing Committee authorizes the following:

In agreement with the industry the Price Fixing Committee has extended the present maximum prices on New England spruce until December 1, 1918.

The present prices of New England spruce are: Rough lumber, specified length 20 feet and under, 3,000 pounds weight to 1,000 feet of lumber, $48 to $60; random lengths, $36.50 to $59.

Will Enlarge Plant



For the purpose of keeping apace with the Government demand for aeroplane motor parts, The Steel Products Company, 2196 Clarkwood Road S. E., will erect a new plant which, fully equipped, will cost about $155,000. The building will be 90 by 123 feet, of concrete and brick construction, with steel spans.

Recently, contracts were let for the adding of a fourth story to the main building, which is 60 by 125 feet, and the building of a power plant 70 by 100 feet.

This work, with the new building, brings up the total cost of improvements to about $200,000.

Standard News Notes

Mr. George D. Kershaw, formerly Works Manager of the Standard Aircraft Corporation of Elizabeth, New Jersey, has resigned in order to take up important duties in a large munitions plant in the middle west.

The lathe and milling department of the Excelsior Manufacturing & Supply Company

MILITARY AEROSTATICS

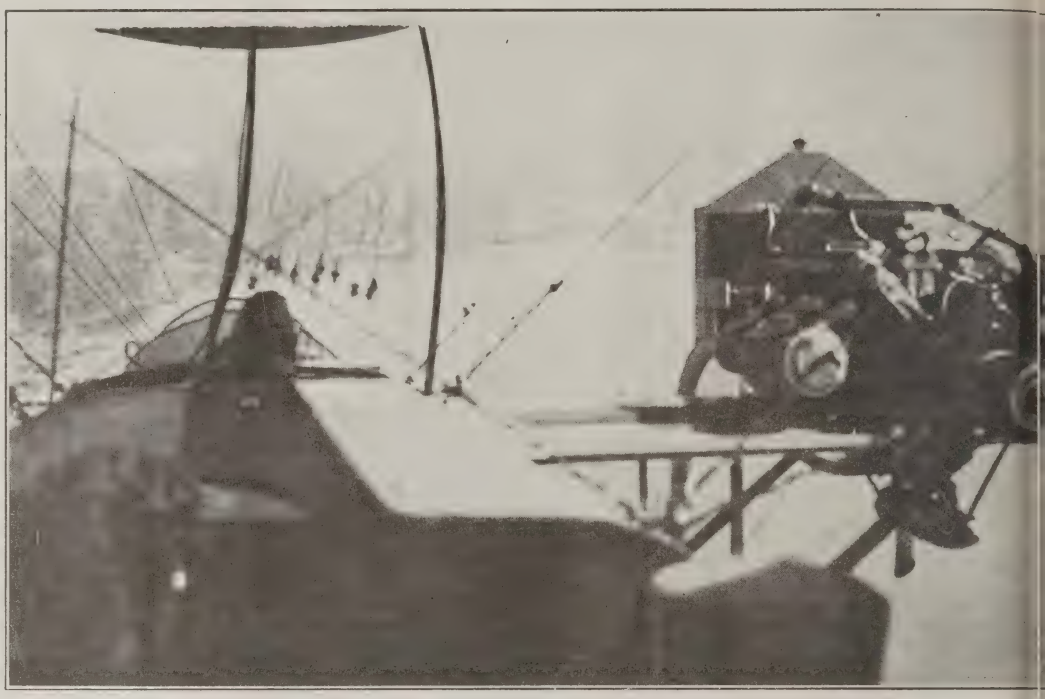
By LIEUT. H. K. BLACK, R. F. C., C. F. A.

Technical Equipment

APART from the optical instruments in the basket there are the several technical instruments which also are a very necessary part of the basket equipment. Chief among these is the aneroid barometer. This, it need hardly be said, is the instrument which records the height of the balloon at all times. Though it is a barometer, it is arranged to read in thousands of feet instead of in inches of mercury. It is adjustable and can be set to zero before the balloon leaves the ground each day, thus making itself independent of the daily variation. It is generally hung in the rigging of the basket just about the height of the pilot's head for easy reading. Aneroids are rather sluggish in their action, though for that matter it makes very little difference in an observation balloon. However, on occasions when for some reason the balloon was pulled down in a hurry, I have noticed the aneroid reading one hundred feet while I was climbing out of the basket onto terra firma. This sluggishness is of greater moment in aeroplanes, I would imagine.

Of wind measuring instruments there are two which are in more or less common use. Perhaps the more common is the Pitot tube, which is an arrangement of rubber tubes, copper piping and a dial, the whole thing being fastened to a wooden handle. That is not a very lucid description but any balloon pilot who has ever sat up in his balloon in the high winds of France will tell you that the Pitot tube is not a very lucid instrument. Personally, I have felt very much inclined to doubt the word of the Pitot tube when the wind was more than twenty-five miles per hour. The infernal contraption would blithely indicate twenty-six or seven miles per hour when I was morally certain that it was nearer forty-five. However, the menu at breakfast maybe had something to do with that.

The other wind instrument we had beside the bugle, was an Anamometer, which was nothing else than a swanky windmill. It had a propeller which when the instrument was connected with the telephone, produced a click every so many revolutions. The introduction of the Anamometer was a sore blow to some of the "Heroes" of the early days of ballooning in France. With the Pitot tube the people on the ground simply *had* to take your word for what you said the wind was at any given height, and in the early part of the war, a wind of about thirty m.p.h. used to cause a dangerous strain on the cable and when that arrived the balloon hauled down till milder conditions held sway. So it was that a young spark of an observer who was enjoying himself not at all in the basket on account of the wind, or the cold, or the Boche planes, or the rain, or the any one of the thousand things which take away from the joy of ballooning; so it was that when the wind reading was asked for from the ground, this young chap might be prone to make a mistake of ten or fifteen miles per hour, reporting it as forty-five when it might have been only thirty-five, —quite accidentally, of course, oh, Heavens yes—gaining the ground and comfort thereby. He might have done that, knowing the circumstances as I do, I think it might be said to be possible. However, that was in the good old days of ballooning, the Heath Robinson days, when one had only a hazy idea of whether the balloon would go up or down, when ballooning was really dangerous egad,—not from Hun planes, thank Heaven, at that time neither the Huns nor ourselves had dropped the utility of tracer bullets as parachute producers,—but from the weather and the balloon itself.



Nowadays it is different. The young buck observer finds it impossible to swing the lead about the wind, or anything else for that matter. Anamometers have come into use. Now when you read the wind the chart room clerk does it. "Would you mind putting in the wind plug, Sir," says he, and you comply. There ensues a series of "clicks" and then the chart room announces "Thank you, Sir, wind eighteen and seven-eighths m.p.h." Of course, everybody in the basket is quite sure that the wind is thirty miles, if an inch, and the beautifully bright Anamometer whirls merrily on. It is not clicking now and you get on with some shooting. Just as you are comfortably engaged, you hear a Wh-e-e-e-e-e-, behind you, a shell headed for the back of your neck. You turn round suddenly, wondering why a shell is coming at you from behind—and there is the shining Anamometer which has speeded up a bit to a puff of wind, giving an altogether too accurate imitation of a high velocity shell. Oh. damn the Kaiser.

(*To be continued*)

At a British Royal Naval Air Service training camp. The upper picture shows the flying field from where the kite balloons ascend. Two balloon hangars and two balloon beds may be seen in the background. The lower picture shows an old type basket. As it is a naval basket it is made to float in water. Details of the rigging may be seen. The parachute cases are the kind in use at the present time. The small picture at the left shows some cadets acting as part of the balloon crew manning a handling guy

TWIN-MOTORED DIRIGIBLE AND AERO

This photograph was taken from the new American made dirigible. It shows one of the twin Hispano-Suiza motors. The of one hundred and fifty H.P. It is the D. 17, the first of its type to be flown. On October 22nd this dirigible, mann aviation officers of the Marine Corps and the Navy, flew over Washington, D. C., at the completement of the first lap o proximately three hundred and fifteen miles of a flight from Akron, Ohio, to Rockaway, New York

A group of American aviators at an aviation camp on Salisbury Plain (England). Salisbury Plain has become very famou overseas and there they got their first taste of European weather. Accustomed to the clear cold of the New World, they and it constituted a fine training for their trench work in France. Salisbury Plain has always been an aviation center, also. Note the camouflaged hangars in the background. The American boys will find Salisbury a very interesting spot is an old Druids Temple. Big pieces of rock weighing tons are to be seen built up into a rude temple. These rocks

NE AND THE BOYS WHO FLY THEM

At a French Aviation Camp. A Voisin bombing plane. The photograph shows a good deal of the equipment. The machine is twin-motored, of course, and carries a crew of several men. Note the streamlining of everything. The unique type of radiator may be seen above and behind the propeller. The mounting of the forward machine gun indicates the position of the machine gunner with the pilot behind him

oldiers from the New World, for it was on Salisbury Plain that the famous First Canadian Division spent their first winter erely from the rain and the mud. Salisbury Plain, however, was only a foretaste of what they were to get in France arly days the Royal Flying Corps trained at Netheravon and Upavon. Now the American aviators are training there in historical lore. There are mounds or "Tumuli" there which date back to the early Britons and at Stonehenge there been transported for many miles for there is no rock of this particular nature in that section of the country at all

THREE HOURS GAINED ON TRIP WEST BY EARTH'S TURNING—PAST SPEED MARKS SHOW ALL DAYLIGHT FLIGHT IS POSSIBLE

By FREDERICK M. KERBY, N. E. A., Staff Correspondent, New York

Trans-continental aero mail will go from the Atlantic coast to the Pacific within one day's daylight.

This is the assertion of Alan R. Hawley of the Aero Club of America:

"The trans-continental mail lines will soon be established," said Hawley today. "When they are, we may expect to send mail from New York to San Francisco, from Boston to Seattle, from Philadelphia to Santa Barbara, from Washington or Charleston to Los Angeles or San Diego within one day's daylight. This will be done by relays of aeroplanes. The fact that the earth revolves from west to east makes this possible. Pacific coast time is three hours slower than Eastern time. At 3 o'clock in the morning in New York it is only 12 o'clock midnight in San Francisco.

"The direct line from New York to San Francisco, as the aeroplane flies, is exactly 2,500 miles. Figuring daylight from 3 o'clock in the morning until 9 at night gives 18 hours. But the time differential of three additional hours makes the available daylight flying time 21 hours. This would require a speed of only 120 miles per hour to make a non-stop flight across the continent.

"One hundred and twenty miles per hour is not a high speed as aeroplane performance goes now. On October 2 a De Haviland 9 aeroplane, equipped with a Liberty motor and piloted by Caleb Bragg, a civilian pilot of the bureau of aircraft production, flew from Dayton, Ohio, to Washington, D. C., a distance of 430 miles, in two hours and fifty minutes, or at a rate of NEARLY 143 MILES PER HOUR. The Liberty motor produces, on the average, more than 400 horsepower.

"Our Government has already successfully tested out the first of the American-built Caproni aeroplanes, equipped with four Liberty motors, which develop 1,750 horsepower. Aeronautical engineers familiar with the progress that has been made in the last two years in aeronautics, and familiar, also, with the experiments now under way, believe that it is quite possible that we may see a 5,000 horsepower aeroplane within the next year.

"We ought to have plenty of machines capable of making better than 130 miles per hour when we need them for trans-Atlantic mail carrying.

"Before the war an aeroplane flew for twenty-four hours and ten minutes without landing, and a continuous flight of 1,400 miles was made on another occasion. THE WAR HAS ADVANCED AVIATION AT LEAST TWENTY YEARS."

The Chicago Aero Mail

Postmaster General Burleson announced on October 24 that the New York-Chicago aero mail route will be inaugurated between December 1 and December 15. The exact time of the establishment of the service will depend upon the time of the receipt by the Post Office Department of the necessary aeroplanes to operate the line.

The city of Cleveland has set apart for use as a mail field Wooland Hills Park, a magnificent pleasure ground, and will place on it a hangar costing $10,000. Work on this aviation field was begun this week.

The city of Chicago has given the use of Grant Park as an aviation field for the landing of mail ships, and the Aero Club of Illinois has tendered the use of Ashburn Field for hangars, workshops and bunk houses for the mechanical forces. The Association of Commerce of Chicago voted an allotment of $15,000 for the construction of a mail hangar. Work on the Chicago field will begin at once.

Bryan, Ohio, the intermediary stopping point between Chicago and Cleveland for exchange of mail and gassing of aeroplanes, has furnished the Post Office Department with a suitable ground and hangar. Work on the Bryan field was begun last week.

Representatives of the Post Office Department will be in Clarion, Bellefonte, and Lehighton, Pa., this week to arrange for the immediate erection of hangars and preparation of fields at those points.

The New York-Chicago route will be laid out in three legs, the first from New York to Bellefonte, Pa., a distance of 215 miles, with an emergency station and machine midway at Lehighton; the second leg from Bellefonte to Cleveland, a distance of 215 miles, with an emergency station at Clarion, Pa., a distance of 87 miles from Bellefonte; the third leg from Cleveland to Chicago, a distance of 323 miles, with an intermediate mailing station at Bryan.

The plan of operation during the unfavorable winter months contemplates the aeroplanes leaving Chicago and New York at 6 o'clock each morning, with a capacity of about 20,000 letters, and making the trip, including all stops, within a period of ten hours.

The French Aerial Mail

The Paris correspondent of the *Daily Telegraph* writes on August 18:

A postal service by air has been started for the first time in France between Paris and St. Nazaire. Aeroplanes, carrying mails, left Le Bourget Aerodrome, near Paris, shortly after ten, and one of the two machines, the other having had an accident, reached St. Nazaire at 8:30 p.m., after a stoppage at Le Mans. The total distance from Paris to St. Nazaire is some 250 miles.

Key to Abbreviations

AAD—Assigned to active duty.
ABC—Report to Army Balloon School, Arcadia, Cal.
ABC—Report to Army Balloon School, Arcadia, Cal.
ADO—Report to Aviation Supply Depot, Dayton, Ohio.
ADT—Report to Aviation Supply Depot, Dallas, Texas.
AFO—Report to Aviation Supply Depot, Fairfield, O.
AGC—Report to Aviation Supply Depot, Garden City, L. I., N. Y.
AHT—Report to Aerial Gunnery School, Houston, Texas.
AIR—Transferred to the Air Service, National Army, without change in rank or date of commission.
ALF—Report to Camp Alfred Vail, Little Silver, N. J.
AMV—Report to Aviation General Supply Depot, Morrison, Va.
AOV—Report to School for Aerial Observers, Hampton, Va.
APR—Report to School of Aerial Photography, Rochester, N. Y.
ARV—Report to Aviation Supply Depot, Richmond, Va.
ASM—Report to Aviation Mechanics' Training School, St. Paul, Minn.
BFT—Report to Barron Field, Fort Worth, Texas.
BRN—Report to Bakers Field, Rochester, N. Y.
BST—Report to Brooks Field, San Antonio, Tex.
CAF—Report to Carlstrom Field, Arcadia, Fla.
CAP—Commissioned as Captain, Aviation Section, Signal Corps.
CDT—Report to Aviation Concentration Camp, Dallas, Texas.
CFT—Report to Carruthers Field, Fort Worth, Texas.
CGC—Report to Aviation Concentration Camp, Garden City, L. I., N. Y.
CGS—Report to Aviation Concentration Camp, Greenville, S. C.
CIT—Report to Radio School, Carnegie Institute of Technology, Pittsburgh, Pa.
CJS—Report to Camp Jackson, Columbia, S. C.
CJW—Report to Camp John Wise, San Antonio, Texas.
CLR—Commissioned as Colonel, Aviation Section, Signal Reserve Corps.
CMV—Report to Aviation Concentration Camp, Morrison, Va.
CPA—Commissioned as Captain Air Service, National Army.
CPR—Commissioned as Captain, Aviation Section, Signal Reserve Corps.
CRI—Report to Chanute Field, Rantoul, Ill.
CSO—Report to the Chief Signal Officer, Washington, D. C.
CUI—Report to School of Military Aeronautics, Cornell University, Ithaca, N. Y.
CWT—Report to Call Field, Wichita Falls, Texas
DAF—Report to Dorr Field, Arcadia, Fla.
DAP—Report to Director of Aircraft Production, Washington, D. C.
DIK—Report to Camp Dick, Dallas, Tex.
DIS—Honorably discharged from service.
DMA—Report to Director of MilitaryAeronautics, Washington, D. C.
ELA—Report to Eberts Field, Loanoke, Ark.
EOT—Report to Ellington Field, Olcott, Texas.
FLA—Commissioned as First Lieutenant Air Service, National Army.
FLR—Commissioned as First Lieutenant, Aviation Section, Signal Reserve Corps.
FLT—Commissioned as First Lieutenant, Aviation Section, Signal Corps.
FOB—Report to Fort Omaha Balloon School, Omaha, Neb.
FRF—On duty requiring regular and frequent aerial flights.
FSO—Report to Fort Sill School for Aerial Observers, Fort Sill, Okla.
GIT—Report to School of Military Aeronautics, Georgia Institute of Technology, Augusta, Ga.
GLC—Report to Gerstner Field, Lake Charles, La.
HHN—Report to Hazelhurst Field, Mineola, L. I., N. Y.
JMA—Rated as Junior Military Aviator.
JRC—Report to Jackson Field, Riverside, Cal.
KST—Report to Kelly Field, So. San Antonio, Tex. (When specified in the order, the number of the field is given in parentheses)
LDT—Report to Love Field, Dallas, Tex.
LHV—Report to Langley Field, Hampton, Va.
MAC—Report to March Field, Allesandro, Cal.
MAJ—Commissioned as Major, Aviation Section, Signal Corps.
MAT—Report to Mather Field, Sacramento, Cal.
MDO—Report to McCook Field, Dayton, Ohio.
MIA—Report to U. S. Naval Air Station, Miami, Fla.
MIT—Report to School of Military Aeronautics, Massachusetts Institute of Technology, Boston, Mass.
MJA—Commissioned as Major Air Service, National Army.
MJR—Commissioned as Major, Aviation Section, Signal Reserve Corps.
MSC—Report to Radio School, Maryland State Agricultural College, College Park, Md.
OBS—Attached to the Aeronautical Service as Observers.
OSU—Report to School of Military Aeronautics, Ohio State University, Columbus, Ohio.
PFO—Report to Post Field, Fort Sill, Okla.
PMT—Report to Park Field, Millington, Tenn.
PUP—Report to School of Military Aeronautics, Princeton University, Princeton, N. J.
PWM—Report to Payne Field, West Point, Miss.
REL—Relieved from present duty.
RSD—Report to Rockwell Field, San Diego, Cal.
RTR—Retransferred to organization attached to previous assignment to aviation duty
RWT—Report to Rich Field, Waco, Tex.
SBI—Report to Scott Field, Belleville, Ill
SAG—Report to Souther Field, Americus, Ga.
SGS—Report to Camp Sevier, Greenville, S. C.
SLA—Commissioned as Second Lieutenant Air Service, National Army.
SLR—Commissioned as Second Lieutenant, Aviation Section, Signal Reserve Corps.
SLT—Commissioned as Second Lieutenant, Aviation Section, Signal Corps.
SMA—Report to School of Military Aeronautics, Cambridge, Mass.
SMM—Report to Selfridge Field, Mount Clemens, Mich.
SRC—Report to Columbia School for Radio Officers, New York City.
TFT—Report to Taliaferro Field, Fort Worth, Texas. (When specified in the order, the number of the field is given in parentheses)
TMA—Report to Taylor Field, Montgomery, Ala.
UCB—Report to School of Military Aeronautics, University of California, Berkeley, Cal.
UIU—Report to School of Military Aeronautics, University of Illinois, Urbana, Ill.
UTA—Report to School of Military Aeronautics, University of Texas, Austin, Tex.
VBW—Report to Vancouver Barracks, Washington.
WAC—Report to Aviation Concentration Camp, Waco, Tex.
WCS—Wire to the Chief Signal Officer upon arrival.
WDM—Wire, Director of Military Aeronautics, upon arrival.
WFO—Report to Wilbur Wright Field, Fairfield, Ohio.

Notes

Note 1—Report to places mentioned in order named for temporary duty.

Note 2—Report to District supervisor, Houston, Texas.

Note 3—Report to Air Service Training School, West Point, Ky.

Note 4—Take Station at the District Office, Buffalo, N. Y.

Note 5—Report to C. P. I., 235 West 23rd St., New York City.

Note 6—Report to District Mgr., Aircraft Production, Postal Telegraph Bldg., San Francisco, Cal.

Note 7—Report to District Officer, 480 Lexington Ave., New York City.

Note 8—Report to Commanding Officer, Indianapolis, Ind.

Note 9—Report to District Mgr., A. P., Detroit, Mich.

Note 10—Report to Aviation Gen. Supply Depot, Middletown, Pa.

Note 11—Report to Duesenberg Motors Corp., Elizabeth, N. J.

Note 12—Report to Aviation Gen. Supply Depot, Little Rock, Ark.

AT AN AMERICAN AVIATION FIELD

Lower left-hand corner—Aeroplane just rolled out of hangar, plane crew of cadets in charge, under an instructor. A plane crew consists of five men, a sergeant, a corporal who is the motor man, two first-class privates who have charge of the wings, and a third-first-class private who looks after the fuselage and controls. Center—A good view of the propeller and nose of an aeroplane. An officer is receiving the report of the cadet-crew chief upon the condition of the plane, and the motor man is looking after some detail of the engine. The wheels of the plane are Ackerman wheels. Lower right—View of an aeroplane shed or hangar with planes assembled and partly disassembled. Upper pictures—Cadets being instructed, marching to mess, and on the line with a machine. The enlisted skilled workman does most of the things the cadet has learned to do at Ground School

The "Breguet" biplane with the Renault motor

FOREIGN NEWS

BRITISH

The following official communication dealing with aviation was issued on October 25:

We heavily attacked the railway junction at Hirson Wednesday during the day. Four enemy machines were shot down. Ten of our machines are missing.

A new German aviation squadron made its appearance over the lines in the vicinity of St. Juvin. Some of the machines were painted bright vermillion and others dark gray with a plain black cross on them. Some of the machines had flaming red noses. Many of them dropped propaganda.

A War Office communication dealing with the operations of the British forces on the Italian front, issued on October 27th, says:

"Our own and allied aircraft has displayed much activity, carrying out powerful bombing operations against the enemy's lines of communications and repeatedly attacking his troops in positions and on the march with machine-gun fire. Ten hostile aeroplanes were brought down in aerial combats. On the railway station of Levico, which was surprised in full activity, 500 kilograms of bombs were dropped last night by one of our airships."

Reports describing operations of the British forces in Italy under Lord Cavan pay high tribute to the brilliant and successful work of the royal air force. From March 10th to September 14th no fewer than 294 enemy aeroplanes were brought down, and nine hostile balloons destroyed with a loss to the British of only twenty-four machines.

The proportion of ten enemy machines destroyed for every British machine reported missing, it is pointed out, reveals the very striking superiority in airmanship of British pilots over that of the Austrians.

"Thirty-two enemy machines were destroyed on October 28th and ten were driven down out of control," says a British official communication dealing with aerial operations.

The British Independent Air Force has again been busily engaged in bombing German positions far behind the battleline and has met with good results, according to another official statement.

"On Monday we carried out heavy attacks on the Morhange and Frescati airdromes," says the communication. "Monday night we attacked the Badische soda factory at Mannheim and the railways at Treves and Saarbröcken. The railway junctions of Longuyon, Tecouviez, and Thionville were also attacked with excellent results.

"Today the railway juunction of Longuyon and the aerodrome at Jamainetz were attacked."

FRENCH

The official report of the War Office for October 26th says of aviation activities:

On October 25th our air squadrons gave our troops effective co-operation during the battle along the front of the Fifth Army. Our pursuit patrols likewise circled over the field of battle at a height of from one to two hundred meters, assuring security of the air.

Our observation planes, flying still lower, machine-gunned the enemy troops, convoys and batteries, supporting the tanks in their attacks, regulating the fire of our artillery and marking the advance of the infantry.

One air crew fearlessly carried out its work forty meters above the earth, braving the fire of the German machine-guns, which were reported to our troops by signals. Another at an altitude of less than 300 meters carried out a reconnaissance five miles inside the enemy lines and was able to report large enemy reinforcements arriving by camions in the region of St. Fargeau, which were immediately taken under our fire.

The work of our air squadrons continued on October 27th with great success. Our observers carried out numerous reconnaissances over the areas behind the enemy front and brought back highly important reports for the commanding officer and numerous photographs. They reported fires at many places on the right bank of the Aisne, which are still in the hands of the enemy, as well as in the Serre Valley, between Marle and Montcornet.

Our bombing machines carried out expeditions in the region of Serraincourt. This village, which is at the junction of several roads, is of considerable importance in the revictualing of the enemy.

One hundred and twenty bombing aeroplanes and eight pursuit machines engaged in an enterprise in successive groups, attacking special objectives, especially revictualing convoys, munition depots, and barracks in that region, as well as troops reported in the ravine south of Serrincourt. Thirty-three tons of projectiles and 150,000 cartridges were utilized, causing serious losses to the enemy and great disorganization, and at certain points stopping traffic entirely. Several fires broke out in the barracks, and an explosion in a munitions depot resulted from these operation.

In the course of the day nine enemy aeroplanes were brought down and one captive balloon was burned.

On October 30th aerial observers, in reconnoitering expeditions, brought back important reports. Many fires were observed in the region of Marle and Montcornet. Seventeen enemy aeroplanes were brought down or seen to fall in a damaged condition, and one balloon was burned. Our bombing machines dropped 26,850 kilos of projectiles on the railway stations at Longuyon, Mezières, Hirson, Dommary-Baroncourt, Spincourt, Launois, Chimay, Montcornet, and Vervins, as well as on cantonments and bivouacs in the region of Chaumont-Porcien and Montcornet.

The French official report for October 29th contains the following on aviation:

"Our reconnoitering machines have pressed very far into the enemy zone and brought back hundreds of photographs, many of them being taken between thirty and fifty kilometers from the front. Nine enemy aeroplanes were downed or fell out of control. A captive balloon was set on fire.

"During the night our bombing squadrons dropped sixteen tons of projectiles on large railway stations and important points of concentration, particularly on the railway stations of Hirson, Vervins, St. Gobert, Mont Cornet, Marle, and Audun-le-Roman, and on the aviation grounds of Mars-la-Tour and on large depots at Provizy. Numerous fires were started by our projectiles, namely, at Provizy, Hirson and Marle."

The official report on aerial operations says:

October 29th our observation aeroplanes spread over the areas behind the enemy's front and pushed forward for more than thirty kilometers inside the lines. Some proceeded as far as eighty kilometers (nearly fifty miles), while one got as far as 120 kilometers into the zone occupied by the Germans. The patrols brought back 1,350 photographs and useful reports.

Bombing machines dropped more than 37,000 kilos of explosives on and fired 20,000 cartridges at enemy concentrations and convoys in the region of Remaucourt, Son and Seraincourt. In the course of these operations and cruising enterprises by fighting planes twenty enemy machines were brought down or fell in a damaged condition and three Drachen balloons were burned.

During the night our bombing machines attacked enemy railway stations where activity was being displayed. They dropped 18,000 kilos of projectiles with good results on the junctions at Givet, Mezieres, Hirson, Vervins and Montcornet, and on depots and bivouacs in the region of Provisy and Montcornet.

GERMAN

During October 27th and 28th we have shot down forty-nine enemy aeroplanes.

Berlin, Oct. 30th (via London).—The official statement of the General Staff for October 30th reads:

We shot down twenty-seven enemy aeroplanes yesterday.

Referring to October 29th, General Headquarters says: "There was particularly lively activity yesterday. We shot down fifty-eight enemy aeroplanes and two captive balloon."

ITALIAN

On October the 4th, the bombing squadrons bombarded with great success the enemy's lines of communication, and at a low altitude have fired by machine-gun on the aviation field at Tirana.

The renewal of favorable atmospheric conditions increased the aerial activity. In an aerial fight four enemy machines fell.

On October the 5th, the activity of our bombing squadrons was considerable during the entire day, making its effects felt on depots and on concentration camps. The results of the numerous aerial fights were four enemy machines sent to earth.

On October the 6th, our aviators were very active. Enemy squuadrons attempted to pass the lines at Val Lazarrina, but they were faced and put to flight. One enemy machine fell on Lusegana.

The enemy aviation fields at Alto Adige were bombarded with great success by our squadrons, and with incendiary bombs the destruction of the hangars was accomplished. Other squadrons bombarded the rear of the enemy's lines on the Alsipiano di Asiago.

On October 7th. During the nights of the 6th and the 7th our dirigibles bombarded with great effect the enemy's aviation fields in the Venetian Plains and the military camps of Premolano and Uscine. During the numerous aerial flights, two machines fell to the earth.

A squadron of bombing machines dropped several tons of bombs on the Navy Yard of Pola with very good results. Two enemy aeroplanes were brought down and three others forced to land out of control.

Major Gabriele D'Annunzio, at the head of the pilots who made the raid on Vienna, was presented by King Victor Emanuel the High Decoration of "Officer of the Military Order Savoy." A dozen of the British pilots on the Italian front received the Italian silver medal for valor.

After the ceremony there was the largest review yet held of the Italian Flying Corps.

The aerial activity was handicapped by the bad weather prevailing on the whole front; nevertheless, three enemy aeroplanes were brought down by our pursuit machines.

On October 17th, our aeroplanes made reconnoitering raids on the Friulan and Venetian plains. An enemy balloon was downed over Oderzo. The weather was still very bad. It was raining in the lower valleys and in the plains, and snowing in the mountain zone.

On October 18th, notwithstanding the continuous bad weather, our aeroplanes were partially active on the front. Troops being transported were gunned with effective results.

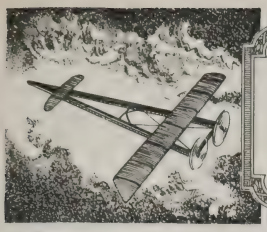
On October 18th and 19th, there was little aerial activity on account of the very bad weather. On the 19th our planes were active on the Piave, making reconnoitering raids.

On October 21st, there was very little aerial activity on account of the weather.

On October 22nd, our aeroplanes bombed enemy centers of communication and brought down three enemy machines.

On October 23rd, our aeroplanes bombed military objectives in the region of Fonzaso and Sacile. The weather was still bad along the whole front.

On October 24th, Italian bombing squadrons dropped bombs over the enemy camps in the region of Fonzaso and over the large enemy depots in the neighborhood of the station of Sacile.



On October 25th, our airships, bombing and pursuit planes were very active on the Brenta, Cismon, Feltre and Fonzaso regions, helping to carry on our big drive against the Austrians. More than ten tons of explosives have been dropped on military centers. Three enemy machines were brought down.

On October 26th, squadrons of our aeroplanes, operating in following rings, bombed very severely and with splendid results enemy camps and depots, bombed and destroyed columns of marching troops and dropped altogether more than two tons of bombs on Val Sugana, Val di Cismon, and on the Conca di Arten. Two tons of bombs were dropped during the night by airships over the railway junction. Two enemy machines were brought down by our aviators. In Albania numerous reconnoitering raids were carried on by our aeroplane squadrons.

On October 27th, during our big drive across the Piave, the aerial machines participated continuously with extreme daring to the fight. More than fifteen tons of high explosive were dropped on the enemy lines. Enemy troops were machine-gunned from a very low altitude by our machines. Eleven aeroplanes and three balloons were dropped down in the aerial battle. Col. Piccio got his twenty-fourth victory.

During the week of October 20th-27th, the aviation of the Italian navy made frequent reconnoitering raids along the Albanian coasts and rear stations of the enemy, going farther than Antivari. On the 22nd of October, Italian hydroaeroplane squadrons bombed the big Lagosta hangar. On the 23rd, 43 bombing machines, of which 13 were American, dropped more than three tons of explosives over Pola with very efficient results, destroying many of the big Austrian hangars. Notwithstanding the Austrian anti-aircraft guns and useless enemy's machines, all our machines came back safely.

On October 31st, in spite of bad weather conditions, our aviators succeeded in bringing down two enemy aeroplanes and one observation balloon.

ELEMENTARY AERONAUTICS *and* MODEL NOTES

By John F. McMahon

Model Aeroplane Building as a Step to Aeronautical Engineering

A FAST machine will require a small angle of incidence, and flying slowly a greater angle. So in order to sustain a certain weight we can alter angle of incidence, area or speed.

The ratio of lift to drift determines the efficiency of a wing, the higher the L/D the smaller the dragt for lift and weight of machine at a certain speed, and of course less power is required. The highest L/D for the U. S. A. No. 1 curve is at 4 degrees and this is the angle the wing will be most efficient, but when used in a speed scout every pound of resistance cuts down the speed and instead of selecting an angle of 4 degrees we would have to select one where Kx or resistance is lowest. This is found at zero degrees.

Under the heading "Distance of C. P. from the leading edge in fractional part of the Chord" will be found the location of the center of pressure for each angle. Suppose we wished to locate the center of pressure for a U. S. A. No. 1 wing section with a six-foot chord a 4 degree angle of incidence.

Looking in this column opposite 4 degrees we find .340 and to locate the C. P. we simply multiply 6 feet by .340.

Then reducing 6 feet to inches we have

$$72 \times .340 = 24.48 \text{ inches.}$$

Then the center of pressure at 4 degrees will be 24½ inches from the entering edge of the wings. By using the ratio alongside of each angle the C. P. of any wing at all angles can be found.

The writer has used only U. S. No. 1 wing section in the preceding work, but these equations can be applied to any wing curve if a table of the lift, drift, etc., are given.

Wing Curve No. 1 is for a fast machine of light weight. Should we have a medium fast machine to carry more weight we would use Wing Curve No. 3. For heavy machines such as flying boats, seaplanes and the like we would use a curve like No. 4, because its maximum lift coefficient is high .00364 which occurs between 14 and 15 degrees.

It is interesting to know that a wing will give lift even when the entering edge is lower than the trailing edge. Upon consulting the table we see that the three wings under consideration show a lift even when the wing is set at an angle of minus 2 degrees. It is not good practice to set a wing at this angle, first, because the resistance is greater than when set at a low positive angle, and secondly, because any slight change in the course of the machine downward would cause it to pitch or nose dive.

When designing a fast machine the designer generally sets the wings at an angle in which the Kx (resistance) is lowest. For curve No. 1, this occurs at zero angle. Again some designers prefer using an angle where the L/D is the greatest; in this case it would occur at 4 degrees. This seems rather high for a fast machine, but it is the most efficient angle and is used extensively on British scouts.

As mentioned in another article, the angle speed or surface of a wing can be altered at the will of the designer; for instance, you can use a wing of 160 sq. ft. at an angle of 2 degrees traveling at 120 M.P.H., which, when figured, gives a lift of 2,640 lbs., or you can reduce the speed and make the angle of the wing greater; for instance, changing the speed to 90 M.P.H. and the angle to a little over 8 degrees, which will also show a lift of 2,640 lbs., but the horsepower required to drag the wing through the air will have to be greater.

While speaking of horsepower it might be well for us to stop here and study the method used in figuring the H.P. necessary to pull the wing through the air.

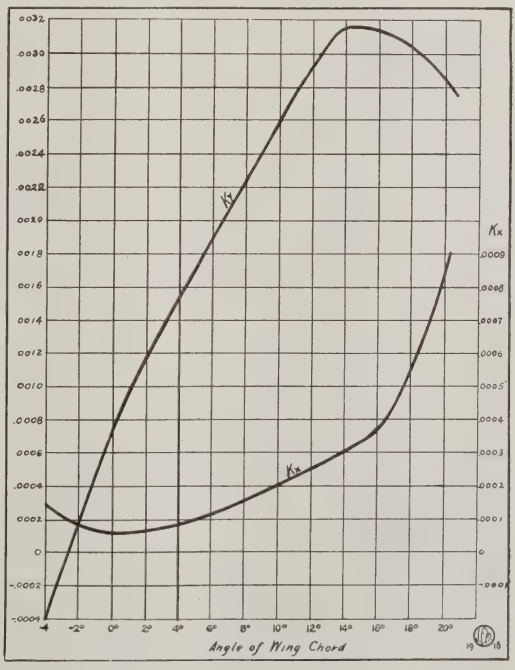
Test shows that 1/375 horsepower is needed to overcome a resistance of 1 pound at one mile per hour. The Kx of a Wing having the No. 1 curve set at an angle of 1 degree is .000067, and to figure the resistance at 120 M.P.H. we proceed as follows: we will say that the surface is 200 sq. ft. Then to find the resistance multiply .000067 by 200 and this product by the square of 120 or .14400, which gives us 192.96, or roughly 193 lbs.

Now, if it takes 1/375 H.P. to overcome 1 pound at 1 mile per hour, then by multiplying 193 lbs. (which is the resistance) by 120 (which is the speed) and dividing this product by 375 we will find the actual horsepower required.

$$\frac{193 \times 120}{375} \text{ or } 23160 \div 375 = 61.5 \text{ H.P.}$$

This 61.5 H.P. is the actual horsepower required, but the horsepower supplied by the engine must be greater on account of the loss of power through the slipping of the propeller. This loss is generally figured as 25%, or, for example, an engine developing 100 H.P. would only show 75 H.P. at the propeller. The horsepower required for the body is also figured in this way (resistance and horsepower required for bodies will be taken up later).

When an aeroplane is traveling slow the angle of the wings to the wind is high and the resistance is high, but as the speed increases the angle diminishes with a corresponding reduction in resistance until a certain speed is reached; then the resistance starts to climb again because of the speed. By checking up we can find the angle and speed where the least resistance occurs, and, of course, the least H.P. is required. This applies to the wings only. The resistance and horsepower required for body, struts, wires, etc., starts low and gradually increases until the maximum speed is attained.



The resistance of these parts is known as parasite resistance, or resistance of non-lifting surfaces, and is figured separately from the wings.

A lift and drift chart accompanies this article, and it would be advisable for the reader to become acquainted wtih the method of reading one. The two heavy black lines show the life and resistance coefficients at different angles this one has been constructed from data on the U. S. A. No. 1 Curve.

The reader will note different degrees along the bottom of the chart. Should we wish to find the Ky at 10 degrees, we simply run our pencil up the line over this point until it reaches the Ky curve; then glancing to the left along the horizontal line we find the Ky coefficient to be .0026. Now suppose we wished to find the Ky at 6 degrees, running our pencil up this line, we find it meets the curve half way between .0018 and .0020. Half way between these points would give us a Ky of .0019.

Kx (resistance coefficient) is found in the same way, only after finding the horizontal line where the curve meets the perpendicular we glance to the right.

(To be continued)

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

Semper Paratus

Brother (to sister whom he has found stitching a pink silk collar to a "nightie"): "Hello, sis, What ho, wedding or air-raid?"

As the Printer Will Have It

We notice by one of the recent papers that "Kite Balloons, operated from shops, are being used to watch for submarines." Doing yeoman's service, maybe.

War in Britain

1st Tommy (to 2nd Tommy just back from leave): "Well, Bill, did you get on any better with the missus this time?"

2nd Tommy: "Yes, much better—I really didn't see much of her. Half the day she was in a margarine queue, and the other half she was working on the allotment."

A Miracle

When you come to the end of a "sweetless" tea—
The dregs of a bitter brew—
When you think of things as they used to be,
And the cup that of old you knew,
You yearn for the vanished sugar lumps,
And o'er them in fancy gloat:
And as you yearn, lo! your sad heart jumps
For a "lump" comes in your throat.

Someone points out that the first item in the index to the Year Book issued by the Royal Aero Club is "Accidents, Fatal: British," and suggests that the well-known Army formula, "Officers, for the use of," might be added. A gruesome jest, indeed, but every aviator is an optimist, and trifles like this will not discourage him.

Sometimes
Us newspapermen
Get into a
Tight corner,
In that we
Have to squeeze
A story of some
Kind
Into a corner just
Such
As this is.
Going back to
The First subject
Of our discourse
This evening, I
Said We call
Ourselves
Newspapermen.
Other people
Call us
Other things
Often.
Sometimes they
Call us things
Which We cannot
Print. But we
Live for our
ART.
By this time you
Have probably
Found out that
We
Were stalling round
Doing something by
Writing this
Way.
The fact of the matter
Is,
This long narrow
Bit of space has
Got
To be filled,
Somehow.
The Boss says he
Don't care how
It is filled, but
IT
MUST
Be filled.
It really
Was the
Fault of the
Art Department
Because they
Made this
Pic'ure on the
Left, so
Infernally
Big, there is
No Room for any
Honest to Column
News.
So Mr. Printer I
Leave it to your own
Good Judgment to
Fill it up.
If there is too much
We can keep it until
The Art Department
Overflows
Again. Maybe we can find a place
To put it next week.

(*Continued from page* 471)

The first voucher presented by the Packard Company for this development work was for $104,500, which was paid on August 11, 1917, upon a certificate of Mr. Deeds, then a civilian in charge of the Equipment Division. While Mr. Deeds was familiar in a general way with the work, it does not appear that he or anyone else acting for the Government, except Mr. Vincent, had detailed information as to what had been done or as to actual cost. The exact amount of the outlays could not then be stated either by the company or by Mr. Vincent, and while definite amounts were placed opposite the particular services and engines described in the voucher, these amounts were mere estimates. The voucher did not so state, but the payments were virtually payments on account. Included in this first voucher (paid August 11) were the salaries and travelling expenses, as estimated, of those in the engineering organization which Mr. Vincent had effected for this development work, including the salary of Mr. Vincent himself after he came to Washington as above stated. As he testified:

"In other words, this item was intended to cover not only the making of drawings, but the moving of engineers here to date and also a lot of travelling expenses incident thereto . . . that was all lumped under original design work . . . Q. Was there any itemization of that anywhere? A. There was not, because it was impossible to make any such itemization. I knew roughly what it would cost. . . Q. How much of that amount of $37,000 included in that voucher (that is, the voucher for $104,500) was for salaries? A. I should say about one-third. Q. For what period were those salaries allowed? A. They were allowed for the period that the men were actually on the job.

* * * * * *

"Q. Is your salary included in the $37,000? A. I think it is."

Another voucher in similar form for $73,194.72 was presented by the Packard Company on November 20, 1917. It was accompanied by a letter from Major Vincent, representing the Engine Design Section of the Signal Corps, to Colonel Deeds which stated:

"I have personally supervised this work and hereby certify that all of the above material has been delivered to the Government and is now being used for Government purposes.

"The prices at which the engines are billed are only approximately correct and may be high or low, but this cannot be determined until a final checkup is made when the job is completed. There are several engines yet to be delivered and before we pay for the final ones, I will arrange to have a checkup made in order to insure that the total amount paid for the entire job is entirely fair to both the Government and the Packard Motor Car Company. I would ask that payment be made the Packard Motor Car Company promptly in this connection, as they are going to a great deal of trouble to do this experimental work for us."

A third voucher for $60,000, for three engines, which was also a mere estimate, was paid on December 6, 1917, on Colonel Deeds' certificate.

The fourth, and final, voucher was paid on January 19, 1918, for the two remaining engines, which were put down at $5,732.19 each so as to bring the total amount expended for the development work within the above-mentioned allotment of $250,000. The Packard Company at this time submitted an itemized statement of its outlays which Major Vincent examined and approved. This statement purported to show the total cost of the entire work, that is the cost of material, and of labor, the direct expense (including travelling and other expenses of the organization which Mr. Vincent brought to Washington for the purpose of working on the design of the Liberty Motor) and the overhead charges. These items aggregate $221,474.75, to which a profit of 12½ per cent. ($27,684.35) was added, making a total of $249,159.10. Major Vincent wrote the following letter to Colonel Deeds in submitting the final voucher with his approval of the itemization of cost:

"Dayton, Ohio, January 19, 1918.

"From: Major J. G. Vincent, Airplane Experimental Engineering Department, Lindsey Bldg., Dayton, Ohio.

"To Colonel E. A. Deeds, Southern Railway Bldg., Washington, D. C.

"Subject: FINAL PAYMENT ON THE LIBERTY ENGINE DEVELOPMENT ORDER.

"1. I am enclosing herewith bills from the Packard Company for the last or No. 6 8-cylinder engine, and the last or No. 5 12-cylinder engine. These bills have been held in abeyance until the Packard Company could furnish us with a final accounting covering the cost of the job.

"2. You will remember that the joint Army and Navy Technical Committee set aside an appropriation of $250,000 to cover the cost of this job. At the time they set aside this amount and asked me to have ten engines built, I was afraid it could not be done within the appropriation, but am glad to be able to advise you that altogether we built eleven engines, as well as two wooden models and ran several tests under this order and still kept within the appropriation. You will note that the last two engines are built at $5732.19 each, as this just balances out the net cost to the Packard Company plus 12½ per cent. profit.

"3. As a matter of general information I want to point out that the Packard Company co-operated with us to the limit on this job, and many of their executives gave a great deal of their time to this work for which they received no pay whatever. It is also a fact that this work was put ahead of a great deal of other work, causing losses which can never be computed. They did this cheerfully because their heart was in the job, and my only object in mentioning it is to, in some degree, give them credit for their attitude, as I know no one at Washington can possibly realize what this brand of co-operation costs.

"4. I want to go on record as stating that I do not know of any other place in the world where this job could have been done at anything like this cost.

"5. During the last two years that I was with the Packard Company they spent approximately a half million dollars on aircraft development work—the spending of this money not only put me in position to know what should make an aircraft engine, but it also resulted in the development of an organization at the Packard plant which was ready and waiting to grab this Liberty job. I think you will find the brief resumé of costs entirely satisfactory, but I simply want to state that the Packard Company, of course, have a complete record of all the transactions, if they should ever be required. I think, however, that this job is so obviously reasonable that nothing else will be required. I want to urge that you have final payment made to the Packard Company immediately, as they are carrying on a lot of development work for us and are, therefore, carrying considerable investment at all times.

(Signed) J. G. VINCENT,
Major, S. C., U. S. A."

The irregularity of proceeding in this manner without a contract or proper order in writing is apparent. No price had been fixed for the work or materials; if only outlays were to be reimbursed, it was necessary that outlays should be appropriately proved before payment was made, and this had not been done in the case of the first three payments. Nor does it appear that at the time the first voucher for $104,500 was passed, on or about August 11, 1917, Mr. Deeds had any authority in the absence of a written contract or a proper written order to give the certificate. The Chief Signal Officer testifies that he did not have such authority. Nor was his certificate itself accurate in its terms, as there was no agreement for a price, and if there was an agreement for the reimbursement of actual outlays, the voucher, being a mere estimate, was not in accordance therewith.

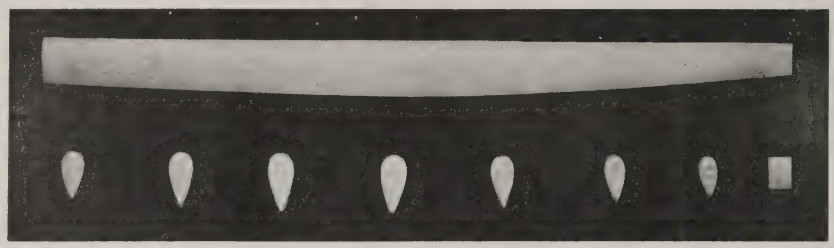
It should be said, however, that the evidence does not afford ground for the conclusion that the Government was defrauded or that there was any intent to defraud the Government on the part of any of the parties concerned. The work was development work, these first engines being made by hand in advance of tooling up for quantity production in order to standardize the design, and it does not appear that the services rendered were not worth the amount paid or that the estimates of the outlays were not fair estimates; that is, that the amounts as estimated were not actually expended as set forth in the final statement. Both Major Vincent and Mr. MacCauley, the president of the Packard Motor Car Company, testify that the amount paid under these vouchers as finally adjusted did not embrace any expenses incurred in the original work of the Packard Company in developing an aircraft engine, that is, prior to the time when Mr. Vincent came to Washington on May 27, 1917. Viewed as an arrangement for services on a cost plus basis, the allowance of profit does not seem to be excessive. While the vouchering was irregular, there is no sufficient basis for a charge under the statutes relating to false and fraudulent vouchers or the facilitating or obtaining of payments with intent to defraud the Government.

A distinct question, however, is presented as to Lt.-Col. Vincent. Section 41 of the Criminal Code explicity prohibits any person who is directly or indirectly interested in the pecuniary profits or contracts of a corporation from acting as an officer or agent of the United States for the transaction of business with such corporation. It is manifest that Lt.-Col. Vincent acted as an officer and agent of the Government for the transaction of business with the Packard Motor Car Company in which he was a stockholder, and that this was in violation of the statute.

Lt.-Col. George W. Mixter

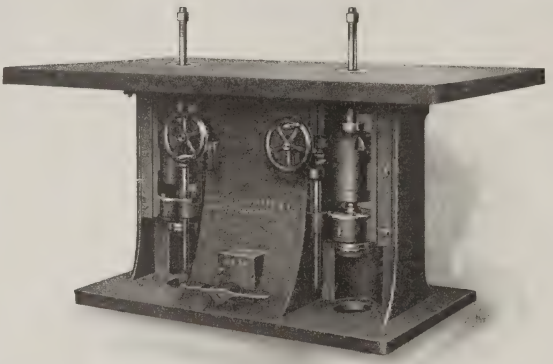
Lt.-Col. Mixter, formerly vice-president of Deere & Company, of Moline, Illinois, manufacturers of agricultural machinery, came to Washington in July, 1917, to undertake the organization of the Inspection Department of the Aircraft Engineering Division of the Signal Corps. He was later chief of the Inspection Department of the Equipment Division of the Signal Corps. He was commissioned as an officer in the Signal Corps, with the rank of Major, about August 15, 1917. The work of the Inspection Department covered the inspection or acceptance of material and manufactured articles furnished to the Signal Corps, including the inspection of airplanes and engines manufactured under contracts with the Government. As chief of the department, Major Mixter dealt with the matters of organization and personnel and exercised a general supervision over the department in matters of administrative policy. In May, 1918, Major Mixter was made production manager and on the reorganization which resulted in the establishment of the Bureau of Aircraft Production he continued to carry the title of Production Manager, being directly under Archer A. Landon, who is Director of the Production Division which is broadly charged with the actual execution of the aircraft program after the receipt of engineering data.

Prior to his connection with the Government, Mr. Mixter held 25 shares (par value $2500) of the preferred stock of the Curtiss Aeroplane and Motor Corporation. He has not disposed of this stock. He testifies that he had sold his common stock in the company about two years ago and that he had not given thought to the retention of the few preferred shares; that his personal accounts are kept at his office in Moline, and are in charge of his secretary. The Curtiss Company had important contracts with the Government for the production of aeroplanes and Lt.-Col. Mixter was in charge of the organization of the inspection of materials and products at its plant as well as at other plants, and he visited the Curtiss plant from time to time in the exercise of his authority as head of the inspection department and as production manager, and as an officer of the Government he dealt with such questions at this plant as required attention.



The statutory phrase "transaction of business" is broad enough to embrace the activity of officers or agents of the United States who are heads of divisions having charge of the inspection of products under contracts requiring the action of Government inspectors in course of performance. It would be a narrow construction to hold that the statue (Crim. Code, Sec. 41) is limited to the making of contracts or the placing of orders or transactions relating to payment or discharge. It would seem to be quite as important that the chief of a department of inspection, selecting the inspectors who act under his instructions at the plants of contractors, should be free from interest in the corporation whose work is inspected, as the inspectors themselves, and both the chief of an inspection department and the inspectors may properly be regarded as agents of the Government for the transaction of business with the corporation. The same would be true of the production manager having supervision of production under contracts with the Government. No ruling in the Federal Courts with respect to the applicability of the statute to such an officer or agent of the Government has been found. In the view that the statute has the scope suggested, Lt.-Col. Mixter acted as an officer or agent of the United States, contrary to the prohibition, for the transaction of business with the Curtiss Aeroplane and Motor Corporation, in which he was a stockholder. His holdings were small, but it cannot be said that for that reason the statute is inapplicable.

Major Howard C. Marmon



Major Marmon joined the Signal Corps about June, 1917, and almost immediately was sent to Europe with the Aeronautical Commission. On his return he was assigned to duty with the Aeroplane Experimental Department at McCook Field, Dayton. Prior to his service with the Government he was vice-president and engineer of the Nordyke & Marmon Company of Indianapolis, which was engaged in manufacturing mill machinery and motor cars, and he held $15,000 in par value of the stock of that company, its book value being several times its par. On entering the Army, he gave to his brother a power of attorney to dispose of his shares and they were transferred to his mother, Mrs. Elizabeth C. Marmon, and have since stood in her name. The transfer was a gift; Major Marmon testifies that he has no interest in the stock. His mother turns over to him the income of other property which is the equivalent of the salary he had previously received from the Nordyke & Marmon Company.

The Nordyke & Marmon Company has a contract for 3,000 Liberty Engines, and spare parts, and previously had a contract, which was

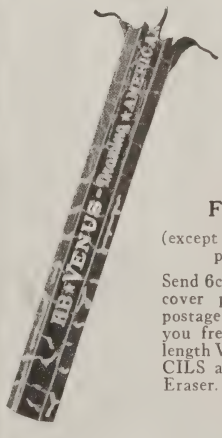
VENUS PENCILS



"The Standard by which all pencils are judged"

In military map drawing accuracy is of utmost importance. That's why the Allied Governments have bought Venus Pencils for the most important, exacting work.

You'll Like Them Best

Whatever your drawing or writing, there's a Venus to exactly fill the bill; to do the work smoothly, easily, quickly, without blurring, smudging or unevenness. Venus Pencils are quality pencils for quality work in every part of the civilized world.

17 black degrees, from 6B softest to 9H hardest. 3 indelible copying

FREE!
(except packing and postage)

Send 6c. in stamps to cover packing and postage and we'll send you free FIVE trial length VENUS PENCILS and a VENUS Eraser.

American Lead Pencil Co.
240 Fifth Avenue - New York
and Clapton, London, England.

You'll Always be Satisfied with Your

RESISTAL EYETECTS

RESISTAL non-shatterable lenses have saved the eyes of hundreds of aviators. The earliest models of these goggles for Aviators are now improved, and the latest RESISTAL EYETECTS are approved by the Army and standardized by the Navy. Their qualities of *absolute protection* and *perfect vision* have given unparalleled satisfaction. We guarantee you will *always* be satisfied with RESISTAL EYETECTS.

Write for Booklet telling of many aviators' experiences, for free test pieces of RESISTAL lenses and for complete sets of Bureau of Standards Reports on non-shatterable RESISTAL.

Pershing Decorates Thaw

Word was received at the Aero Club of America on October 24 that General Pershing had awarded the Distinguished Service Cross, with two citations, to Major William Thaw, American ace and known as the dean of American aviators in France.

This is the first American award received by Major Thaw, who has received several French decorations, among them the Croix de Guerre and the Medal of the Legion of Honor. Those awards were in recognition of Major Thaw's exploits as a member of the Lafayette Escadrille before he entered the American service.

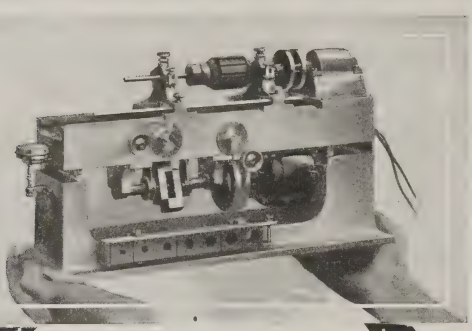
Lieut. Frank Luke, Flyer, Is Missing

With the American Army Northwest of Verdun, —Lieut. Frank Luke of Phoenix, Ariz., one of the most daring of the American aviators, has been missing since the night of Oct. 20. On that night he started out on a bombing expedition, and so far has failed to return.

Lieut. Luke made a specialty of "getting" balloons, and first came into prominence among the American flyers for his prowess in this respect. He was pronounced an expert at "getting" the "gas bags" in their beds, and on one occasion dropped down to within 150 feet of his intended victim.

It is asserted that he once set a balloon afire while it was being towed to its observation post, the attack being delivered before those in charge of the balloon knew he was in the vicinity.

Lieut. Luke was believed to have destroyed nine enemy planes, although he was not officially an ace. He had downed fourteen balloons.



Captain Edward Rickenbacher on Oct. 30 achieved his twenty-third and twenty-fourth air victories. He was over enemy lines doing a bit of boche hunting when a Fokker sped below him. Diving on the German flier, he brought him down in flames.

As Rickenbacher turned to come home he saw an observation balloon on the ground below him and sent an incendiary bullet into it, burning it.

Twenty-one German aviators were downed on Oct. 30 by American chasing aviators. It was a banner day in American aviation.

Two American airmen are missing.

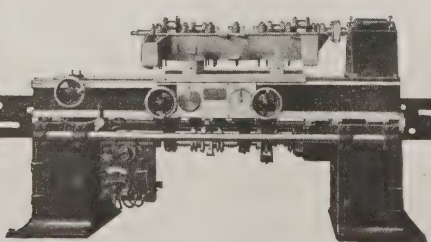
The aerial activity began early this morning, and, aided by the clear weather, American bombers were successful in attacking various enemy points of troop concentration both in the morning and in the afternoon.

FROM

THIS SIZE UP

Not a toy or a model but a regular "Carwen" small enough to measure the correction necessary to secure true running balance in 5 oz. armatures for fractional H. P. motors.

Previous to installing this machine these armatures were "approximately" balanced by a cut-and-dry method, which required much valuable time—now the job is accomplished *accurately* in a very few minutes.



Of course, you may not manufacture a product with rotating parts as small as this but we are also building machines large enough to balance 15,000 lb. rotors and somewhere in between we have a size exactly suited to your particular requirements—be they engine crankshafts, turbine or pump rotors, fans, propellers or other centrifugal apparatus.

The Carwen process of obtaining accurate static and dynamic balance—because of its reasonable expense and cost of operation makes it practical in almost any size shop that builds high speed apparatus.

We can't very well send you a machine on trial without knowing what you need but if you will ship us a crankshaft or armature we'll test it out and demonstrate what we can do for you without any expense other than the transportation.

At least you ought to send for our booklet that explains the principle and operation.

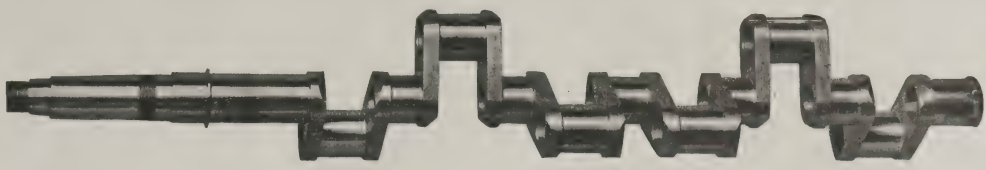
Carlson Wenstrom Company
Erie Avenue at Richmond St.
Philadelphia, Pa.

THE NATIONAL TECHNICAL AND TRADE AUTHORITY

THE EDITORIAL CONTENTS

Printing the largest amount of editorial material, the editorial contents of AERIAL AGE include:

1. Editorials presenting always constructive suggestions concerning the substantial upbuilding of the American aeronautic industry.
2. Comprehensive and complete Trade and General news of the week from every point of the compass.
3. Technical contributions from leading authorities in the aeronautic world on aeroplanes, aero-motors and every other phase of aeronautics.
4. The complete official reports of the Army and Navy Air Services and published weekly together with articles by authorities on Military and Naval aeronautics, thereby insuring to the readers and advertisers a more complete representation of Army and Navy aeronautics than is afforded by any other publication in the United States.
5. A regular department presenting each week some important phase of military aerostatics, being the only magazine in the world to have such a department.
6. Complete reports concerning current aeronautic standardization work here and abroad.
7. Personal notes concerning the men upbuilding the aeronautic industry's affairs.
8. A digest presenting important events of the air services on the war fronts.
9. A page every week for the model enthusiast, giving views of the clubs and construction information.
10. A specially appropriate department in the French and English languages, giving valuable information and table, which our men who go overseas find most advantageous.
11. Last, but not least, a page of aeronautical humor in verse, prose and illustration.



ITS CLIENTELE—AERIAL AGE is read:

1. By **the Executive Heads** of every aeronautical concern in the country who relies upon its contents to inform him concerning the constantly increasing progress of the aeronautic industry.
2. By **the Executive, Engineering and Purchasing Military Authorities** of the United States and the Eighteen Allied Countries, and nine Latin-American countries who have severed their connections with Germany.
3. By **the Engineer** who looks upon it as the medium of information concerning every development of technical importance.
4. By **the Designer** who is made familiar with current progress throughout the world by articles, illustrations, and diagrams contributed by the world's technical experts.
5. By **the Purchasing Agent** who, in its advertising pages, finds a directory which gives the best and the latest products of the aeronautic industry.
6. By the Capitalist and progressive business men who recognize the fact that aeronautics, now one of the key industries, who look to AERIAL AGE for the opportunities afforded by the aeronautic industry, and to AERIAL AGE'S Service and Advisory Department for advice regarding investments.
7. By the Air Service Student who acquires a broad knowledge of what is happening in the Air Services in the United States, and Europe, and for whom we print special articles in French describing the machines with which he will require to become familiar.
8. By the Layman interested in aeronautics, who desires to be kept constantly and correctly informed on the current developments in the Aeronautic Industry and Movement.
9. By **the Juvenile Student** who is interested in model construction and for whom we print special articles of informative value. He will be the expert and the purchaser of the near future.

filled, for 1,000 Hall-Scott engines and spares. The evidence is that Major Marmon had no part in the negotiations relating to these contracts or with the supervision of inspection, production or payments. He has been engaged in the aeroplane experimental department, or engineering department at McCook Field. It does not appear that he has had any transaction with the Nordyke & Marmon Company save that he sent to that Company, with others, from McCook Field, the blueprints for the Liberty Engine. It also appears that he signed a communication from McCook Field relating to a Marmon automobile which had been ordered by Lt.-Col. Vincent for that department. Taking all the facts into consideration, there is no sufficient ground for a charge of violation of the statute in his case.

2d Lt. Samuel B. Vrooman, Jr.

In a subsequent portion of this report, reference is made to the Mahogany Manufacturers and Importers Association, a voluntary association of the leading mahogany manufacturers of the United States, which was formed last January in connection with negotiations for the purchase by the Government of mahogany for airplane propellers. One of the members of the Association is the S. B. Vrooman Company of Philadelphia. 2d Lt. Vrooman is the son of Samuel B. Vrooman who was the head of this company until his death a short time ago. 2d Lt. Vrooman is thirty-one years of age and for upwards of nine years was at work in his father's company, handling lumber, inspecting and selling. On his marriage in June, 1917, his father gave him $10,000 in par value of the company's stock, which for some years has paid 20 per cent. dividends annually. This stock he still holds. In addition to the dividends on his stock, the S. B. Vrooman Company has continued to pay him, since he entered the service of the Government, the sum of $50 a week, which is the equivalent of the compensation he previously received for his services to the company.

In December, 1917, S. B. Vrooman, Jr., identified with the equipment Division of the Signal Corps as a civilian and was made an inspector of mahogany purchased by the Government. In February, 1918, he was put in charge of the inspection of all propeller lumber. He selected the district officers, who in turn selected the inspectors. Mr. Vrooman issued instructions to the district officers, visited the plants to see that the inspectors were doing their duty and passed on disputed points. He has continued in this service and in July, 1918, received a commission as Second Lieutenant. Among the plants subject to his jurisdiction as head of inspection of propeller lumber is that of the S. B. Vrooman Company, which has had contracts with the Government and is within the territory assigned to the district office at New York. S. B. Vrooman, Jr., selected the head of this office, Mr. McCullough, who was responsible to him for the efficiency of the inspection and for the carrying out of his instructions, which related to the inspection at the Vrooman plant as well as others. The conclusion is not to be escaped that S. B. Vrooman, Jr., was the agent of the Government directly responsible for the proper inspection of the mahogany delivered by the S. B. Vrooman Company to the Government under its contracts, and that his acting as such agent for the transaction of business with the corporation in which he was a stockholder was in violation of the statute.

"SERVICE"

"NORMA"
PRECISION
BALL BEARINGS
(PATENTED)

Estimate the serviceability of a machine by the staying power of its weakest part—that it is which sets the limit of service. Analyze it for the essentials. Follow the factors in serviceability through every detail, to the small parts which—while seemingly insignificant—yet determine the capacity of the machine as a whole for maintaining its performance.

The bearings of the electrical accessories of airplane, car, truck, tractor, or power boat determine the service capacity of these machines. Which explains why "NORMA" Precision Bearings are the standard bearings in the ignition apparatus and lighting generators always preferred where maximum service is sought.

Be SURE. See that your electrical apparatus is "NORMA" equipped.

VOL. VIII NEW YORK, NOVEMBER 18, 1918 NO. 10

GERMANY SURRENDERS

ON November 11th President Wilson addressed the Congress and announced the terms of the armistice, as follows:

I.—Military Clauses on Western Front

One—Cessation of operations by land and in the air six hours after the signature of the armistice.

Two—Immediate evacuation of invaded countries: Belgium, France, Alsace-Lorraine, Luxemburg, so ordered as to be completed within fourteen days from the signature of the armistice. German troops which have not left the above-mentioned territories within the period fixed will become prisoners of war. Occupation by the allied and United States forces jointly will keep pace with evacuation in these areas. All movements of evacuation and occupation will be regulated in accordance with a note annexed to the stated terms.

Three—Repatriation, beginning at once and to be completed within fourteen days, of all inhabitants of the countries above mentioned, including hostages and persons under trial or convicted.

Four—Surrender in good condition by the German armies of the following equipment: Five thousand guns (2,500 heavy, 2,500 field), 30,000 machine guns. Three thousand minenwerfers. Two thousand aeroplanes (fighters, bombers—firstly, D, seventy-three's and night bombing machines). The above to be delivered in situ to the Allies and the United States troops in accordance with the detailed conditions laid down in the annexed note.

Five—Evacuation by the German armies of the countries on the left bank of the Rhine. These countries on the left bank of the Rhine shall be administered by the local authorities under the control of the allied and United States armies of occupation. The occupation of these territories will be determined by allied and United States garrisons holding the principal crossings of the Rhine—Mayence, Coblenz, Cologne—together with bridgeheads at these points in thirty kilometer radius on the right bank and by garrisons similarly holding the strategic points of the regions. A neutral zone shall be reserved on the right of the Rhine between the stream and a line drawn parallel to it forty kilometers to the east from the frontier of Holland to the parallel of Gernsheim and as far as practicable a distance of thirty kilometers from the east of the stream from this parallel upon the Swiss frontier. Evacuation by the enemy of the Rhine lands shall be so ordered as to be completed within a further period of eleven days—in all, nineteen days after the signature of the armistice. [Here the President interrupted his reading to remark that there evidently had been an error in transmission, as the arithmetic was very bad. The "further period" of eleven days is in addition to the fourteen days allowed for evacuation of invaded countries, making twenty-five days given to the Germans to get entirely clear of the Rhine lands.] All movements of evacuation and occupation will be regulated according to the note annexed.

Six—In all territory evacuated by the enemy there shall be no evacuation of inhabitants; no damage or harm shall be done to the persons or property of the inhabitants. No destruction of any kind to be committed. Military establishments of all kinds shall be delivered intact as well as military stores of food, munitions, equipment not removed during the periods fixed for evacuation. Stores of food of all kinds for the civil population, cattle, &c., shall be left in situ. Industrial establishments shall not be impaired in any way and their personnel shall not be moved. Roads and means of communication of every kind, railroad, waterways, main roads, bridges, telegraphs, telephones shall be in no manner impaired.

Seven—All civil and military personnel at present employed on them shall remain. Five thousand locomotives, 50,000 wagons, and 10,000 motor lorries in good working order with all necessary spare parts and fittings shall be delivered to the Associated Powers within the period fixed for the evacuation of Belgium and Luxemburg. The railways of Alsace-Lorraine shall be handed over within the same period, together with all pre-war personnel and material. Further material necessary for the working of railways in the country on the left bank of the Rhine shall be left in situ. All stores of coal and material for the upkeep of permanent ways, signals and repair shops left entire in situ and kept in an efficient state by Germany during the whole period of armistice. All barges taken from the Allies shall be restored to them. A note appended regulates the details of these measures.

Eight—The German command shall be responsible for revealing all mines or delay-acting fuse disposed on territory evacuated by the German troops, and shall assist in their discovery and destruction. The German command shall also reveal all destructive measures that may have been taken (such as poisoning or polluting of springs, wells, &c.) under penalty of reprisals.

Nine—The right of requisition shall be exercised by the Allies and the United States armies in all occupied territory. The upkeep of the troops of occupation in the Rhine land (excluding Alsace-Lorraine) shall be charged to the German Government.

Ten—An immediate repatriation without reciprocity according to detailed conditions, which shall be fixed, of all allied and United States prisoners of war. The allied Powers and the United States shall be able to dispose of these prisoners as they wish.

Eleven—Sick and wounded who cannot be removed from evacuated territory will be cared for by German personnel, who will be left on the spot with the medical material required.

II.—Disposition Relative to the Eastern Frontiers of Germany
